

LEGAL.

JOINT FAMILY SYSTEM.

A full bench of the Madras High Court consisting of Justices Wallis, Sundara Iyer and Sadaiva Iyer disposed of a case in which the question raised was whether the marriage of a male member of a joint Hindu family of a twice born caste was a necessity and whether a debt contracted for the purpose of marriage in such a family was binding on the other members of the family. Their lordships were of opinion that marriage was obligatory on Hindus who did not choose to adopt the life of a perpetual Brahmachari or Sanyasi. That being the case a debt reasonably incurred for the marriage of a twice-born Hindu was binding on the other members of a joint family.

ADVICE TO MAGISTRATES.

At the Calcutta High Court on Aug. 8, Justices Carnduff and Imam gave some sound advice to Magistrates in delivering judgment in a revision case in which a rule was issued for the transfer of a case from the file of Mr. Warde Jones, Magistrate of Purnea. The rule was issued on the ground that the Magistrate used unbecoming language towards complainant. Their Lordships in transferring the case, observed "Witnesses are entitled to the protection and nothing can justify the very unbecoming language used by the present trying Magistrate towards the petitioner. A Magistrate should remember always that the dignity of the Court in which he presides is in his keeping. The trying Magistrate seems to have forgotten that in this instance. We further observe, we regret we have to observe, that some of the trying Magistrate's remarks on the order sheet indicate that he is supposed to place the state of his return of work above other considerations."

JOURNALISTS AND JURIES.

The text has been issued of the bill presented by Mr. Braby, M.P., to exempt journalists from liability to service on juries. The measure provides that all journalists within the meaning of the bill are to be absolutely freed and exempted from being returned and from serving on any jury, inquest, or inquiry whatsoever, and their names are not to be inserted in the list of the persons qualified and liable to serve on the same. A journalist within the meaning of the bill is defined as a person who has been for not less than three years professionally, habitually and as his sole or chief occupation engaged upon the staff of a journal or news agency in the capacity of editor, writer of leading, special, or other articles, correspondent, artist, literary manager, assistant editor, sub-editor, or reporter, or in supplying journals with articles, illustrations, correspondence, or reports.

INDIAN BETTING ADVERTISEMENTS IN CEYLON.

A Draft Ordinance has been published in a recent "Gazette" "to deal with the Indian betting advertisements which are from time to time published in the local papers." By an amendment of the Penal Code in 1909 the abetment in Ceylon of an act done outside Ceylon, which would constitute an offence if committed in Ceylon, was made punishable; but from the definition of the word offence, viz., a thing made punishable by the Penal Code, the amendment could only apply to offences coming under the Penal Code. The keeping and advertising of betting establishments is an offence under the Game Ordinance, and not under the Penal Code. Advantage is now taken of a section of the Code which provides in certain specified sections that "The new 'offence' denotes a thing punishable in Ceylon under this Code or under any law other than this Code," to include the amendment referred to, of 1909 amongst the specified sections.

SELECT PRESS OPINIONS.

"The Madras Mail."—Throughout the book there is a cheery note of optimism which ought to be encouraging to those who are exerting themselves to bring about improvements.

"The Madras Times."—This little book is well written, well edited and well published, and we can safely recommend our Indian friends to read, mark and inwardly digest its contents.

"The Daily Post," Bangalore.—The book is an eminently readable one, and if it does not prove useful that will not be due to the fault of the writer.

"The Indian Spectator."—Every young man in India ought to read Mr. Glyn Barlow's book.

O. A. Natesan & Co., Bankers, Chetty Street, Madras.

THE BOOK OF THE HOUR! INDIAN MONETARY PROBLEMS.

BY S. K. SARMA, B.A.

(Late of the "Indu Prakash," Bombay, and "Wednesday Review," Trichinopoly)

This book is the first and the only one of its kind dealing exhaustively with Indian Currency. It discusses the problem of Indian Currency in all its varied aspects tracing its history during the last half a century. It examines the various attempts that have been made to introduce a gold standard with or without a gold currency and points out how it is bad in principle and fraught with evils in practice. Special mention is made of the recent proposal of Sir V. D. Thackersey to introduce a gold currency.

The book will be found useful not only by Indian politicians but all those who take an interest in these problems.

TWO OPINIONS

Mr. D. E. Wacha writes — "I have carefully gone through page after page from first to last and I cannot but congratulate you on your most creditable production. Your powers of assimilation are indeed phenomenal. Very few at your age could have gone through these ponderous volumes of blue books on currency; but it is not only patiently going carefully through them. You have the happy faculty of re-production in a compressed form the salient points contained in those books for a popular treatise. As such your book is a remarkable one and I repeat reflects the greatest credit on you. Your economic studies have stood you in good stead in its preparation. I can confidently commend the work to all our countrymen. I have not yet seen a production of this character from any Indian. Your lucid style and power of expression makes the book so intelligible. The quotations are apt and telling and your own criticism is on the whole sound. This book ought to be in the hand of every educated Indian, for it contains an admirable presentation of the whole problem of Indian currency historically, statistically and critically."

"I think I was perfectly justified when I declined your request to write the Introduction. The book shows your intrinsic merit and points to the fact that you don't want any one to introduce you."

"Capital" writes — "Book of considerable merit flinging out a bold challenge * * * is worth reading by publicists like Mr. Webb, who are inclined to take a little too much for granted when tossing their heads on the public."

The Price of the book is Rs 2 only

INDIAN MONETARY PROBLEMS.

BY S. K. SARMA, B. A.

SOME OPINIONS

MR. A. F. COX, C.S.I.—I have read your book with much interest. *Let me finish up with a well-*

deserved compliment for your English which is excellent.

MR. D. E. WACHA—Contains an admirable presentation of the whole problem of Indian currency historically, statistically and critically.

THE "MANCHESTER GUARDIAN"—Mr. Sarma rightly insists that a gold currency to circulate more than in name, is simply unthinkable in India.

THE "CAPITAL"—Book of considerable merit flinging out a bold challenge.

THE "INDIAN SOCIAL REFORMER"—Mr. S. K. Sarma has written a very readable book on Indian Monetary Problems.

THE "LEADER"—The case against the proposal to introduce a gold currency, could not have been put more strongly, elaborately and ably than it has been presented by Mr. S. K. Sarma on the subject.

THE "COMMERCE"—Very interesting.

THE "HINDU"—The author has done a useful service to students of the subject.

THE "INDIA"—Mr. Sarma makes his points with much clearness and force.

THE "INDIAN REVIEW"—Mr. Sarma deserves to be congratulated on the readable hand-book.

THE "HINDUSTAN REVIEW"—An excellent digest of facts, figures and statistics bearing on the subject.

Price Rs. 2 only.

An Imperial Wrong. The Indians of South Africa.

Helots within the Empire! How they are Treated.

By H. S. L. POLAK.

THIS book is the first extended and authoritative description of the Indian Colonists of South Africa, the treatment accorded to them by their European fellow-colonists and their many grievances. The first part is devoted to a detailed examination of the disabilities of Indians in Natal, the Transvaal, the Orange River Colony, the Cape Colony, Southern Rhodesia, and the Portuguese Province of Mozambique. Part II entitled "A Tragedy of Empire," describes the terrible struggle of the last three years in the Transvaal, and contains an appeal to the people of India. To these are added a number of valuable appendices including petition by the Transvaal Indians to the Hon Dadabhai Naoroji and the President of the Bengal Chamber of Commerce, and by the Transvaal Indian Women to Her Majesty the Queen Congress, also many extracts from speeches or despatches of responsible British Politicians, Statesmen and Administrators, relating to various aspects of the South African Indian question, together with certain information relating to the recruitment of indentured labour for South Africa.

The whole story is a dismal and heart rending one, but it reveals a record of heroism, self-sacrifice, and moderation, that is no example to the whole of modern India, and this small volume should be upon the work-table and office-desk of every public man in this country who is interested in the Indians of South-Africa and desires to have a compendious account of their grievances and their sufferings.

The book contains a portrait of Mr. Gandhi. Price Rs. One To Subscribers of the 'Review,' Rs. 12

"THE HINDU"—The book so far as we know, is the first systematic attempt that has been made to give a connected account of the history of Indians in South Africa—a black record of broken pledges, cruel wrongs, shameful prevarications and harsh treatment. The facts in this volume have been narrated, Mr Polak says, "with as much accuracy and restraint as possible." We have perused the book with much profit and no one after reading it, can fail to be oppressed by a feeling of the enormity of the abuses heaped on British Indians.

"THE TRIBUNE".—Admirable and connected account of the situation in South Africa as regards Indian settlers. give the whole history of Indian emigration into South Africa and sets forth the exact position of the Indians

"THE MORNING POST"—To anybody who wants to master the whole subject from top to bottom we can confidently recommend this little book.

"THE PHOENIX".—Both Messrs Natesan & Co, and Mr Polak have done a distinct public service by providing us with a handy book containing a compendious account of all grievances and sufferings of our fellow countrymen in South Africa."

"THE CHRISTIAN PATRIOT".—"This is a timely and stirring production, enumerating with incontrovertible proofs the indignities, tortures, and continued persecution of the pre-war residents of South-Africa. . . Mr Polak not only marshalls a number of facts which tell their own tale of oppression in this 20th Century, but makes a most pathetic appeal to all Indians to take up the cause of their countrymen."

"THE INDIAN PATRIOT"—"An Elaborate treatise . . . Will be of immense advantage to us."

"THE DAILY POST".—"A forcible review of the question"

"THE MADRAS STANDARD"—"We should like to see the book in the hands of all classes of readers in India."

"THE INDIAN ECHO".—"The book is worth keeping upon the table of every public man in this country."

"THE INDIAN WORLD".—"An unparalleled record of shame and cruelty."

"THE HINDU PATRIOT".—"Those who desire to acquaint themselves with the harrowing hardships of our countrymen in South Africa should do well to read Mr Polak's book and see for themselves what a fierce constitutional battle they are fighting in that foreign land notwithstanding tremendous odds.

"INDIAN OPINION".—"Mr Polak, by his indefatigable industry, has given a record of which Britain as an imperial race cannot be proud, of which a white South Africa has every reason to be ashamed, and which ought to stir India to its depths.

GLYMPSES OF THE ORIENT TO-DAY.

BY SAINT NIHAL SINGH.

In this book, Mr. Singh describes the transition that has taken place in Asia during the last few decades, traces the causes of the awakening and offers a prophesy as to its ultimate effect. He graphically portrays the modern women of the Orient, the political, social and industrial life of India, Persia, Japan, China and other Asiatic lands.

CONTENTS.—Asia's Spell Broken, How Disillusionment Came, Asia a Menace to the West; Japan's Imperial Dream, Oriental Trade Supremacy, Autocracy to Limited Monarchy, The Modern Oriental Woman in the Making, Where Woman has the Upper Hand, The Modernization of Japan, Flaws in Japanese Modernization; Education in Japan, Japan's Material Prosperity, Japan's China's Gaily, The Celestial Student Abroad, Exit the Old, Enter the New in China, Evolution, Not Revolution in India, The Spirit of Maya Leaving Hindustan, To Day in Afghanistan, Persia Evolving Cosmos Out of Chaos, Rural Life in Iran, Egypt's Agitation for Autonomy; Egypt's Preparation for Self Government

HARBINGER—The *Glimpses of the Orient of To-day* is an interesting book by Mr. Saint Nihal Singh who gives short accounts of all the countries in his way to America with regard to their present condition. He finds all of them are awakening from a long sleep. Japan, China, Persia, Afghanistan, Turkey and Egypt are girding their loins for journey in progress. The political questions at stake are well treated of so as to arouse the dormant spirit of the dreamy Indian.

THEOSOPHIST—It shows the power of observation of the writer, and his quick intelligence has grasped and explained many things now going on under the surface in the Orient.

INDIAN INDUSTRIES AND POWER—Mr. S. N. Singh, who has achieved some celebrity in Indo-American journalism, describes in this work the transition which has taken place in Asia during the last few decades, and while tracing the cause of the movement, attempts to portray its ultimate effect. He describes the modern woman of the Orient, the political, social and industrial lives of India, Persia, Japan, China and other Asiatic countries from which it will be seen that the author is ambitious. Whether he has accomplished his object—to place in the hands of Indian youth a work designed to educate and inspire him to further efforts on behalf of his mother country—the reader must be left to judge for himself. We think he has. As a volume the writing contained in which is a revelation of deep study, one which the Orientalist might welcome as an erudite addition to works dealing with the East, the book is valuable. As a brief resume of past and present day conditions, for the use of the school boy, it should find a place in educational literature.

THE CEYLON PATRIOT—The book contains valuable information about the present condition and the prospects of all important Asiatic such as one could pick up only by long residence and study in those countries.

THE INDIAN SPECTATOR—Mr. Nihal Singh, as an Asiatic, is justified in writing out merely in the cold matter of fact style which may be adopted by a European traveller, but with the faith and fervour of a reformer. Mr. Singh's book is very inspiring and must make the blood of every Asiatic reader run quicker.

UNITED INDIA AND NATIVE STATES—Saint Nihal Singh has an international reputation as a contributor of articles to the magazines of America, England and India. There is not a month when some article from his pen does not appear in some leading Magazine or other. Anything therefore from him is sure to have a great value which deserves to be read by Indian readers. The *Glimpses of the Orient To Day* is no exception. In this book he gives the results of his first-hand knowledge of the countries of Asia in their present social, mental and political condition—what strikes they have made and what yet greater strides they are capable of making. Such a book ought to be read by one and all. It brings before the reader a higher ideal, creating a spirit of noble discontent with his inactivity and selfishness. These are not small matters to be dismissed. The *Glimpses of the Orient To-day* will achieve this result. We would therefore ask our readers to go in for the book immediately.

The Guardian.—Mr. Saint Nihal Singh tells us how the impact of the West upon the East has shaken the Oriental out of his metaphysical musings and taught him to think of the world of to-day, how the new awakening is to be traced in all Eastern countries. He is an optimist and in favour of an all-sided progress. The spirit that runs through the whole book is commendable and deserves to be imbibed by the Indian youths for whom the book is intended.

HIS MAJESTY'S VISIT TO INDIA.

[In response to a request from the Editor of this Review to join in a symposium on "The significance of the King's Visit to India," the following have been received.]

SIR WILLIAM WEDDERBURN, BART.

You ask me to join in a symposium and to tell you what I think of the announcements at the Delhi Durbar? My feeling is that they are almost too good to be true. They seem to me admirable, whether we look (1) to what has actually been decided, or (2) to what is "adumbrated" for the future, or (3) to the spirit which illuminates the whole proceedings. As to (1), the Partition of Bengal has been rectified, and thus the chief root of bitterness, affecting all India has been taken away; the Viceroyal capital has been moved from the Anglo-Indian influence of Calcutta to the purely Indian surroundings of Delhi; and a handsome contribution has been given to popular education, with a promise of support "on a generous scale" in the future. As regards (2) we see adumbrated the federation of the great Provinces, leading directly to self-government; and (3) the whole announcements breathe a spirit of justice and sympathy. There has indeed been a most happy conjunction of circumstances: Indian public opinion, matured and focussed by the Indian National Congress, is in complete accord with the true principles of British rule; and His Majesty the King-Emperor, speaking on behalf of the British people, has ex-

pressed his "affection for the loyal Princes and faithful Peoples of India" I look forward with assured hope to a new era for India of happiness and progress.

MR MERZA ALI BAIG,

The drama of history has never before exhibited on the Imperial Stage of Delhi a more soul stirring spectacle than what our countrymen have witnessed at the Durbar. But it is not the dazzling splendour of the pageantry that will make the day memorable. What will make the occasion live in history and captivate the imagination of generations yet unborn is the deep significance and graciousness of the Emperor's act in conveying personally to the Indian people a cordial message of his good-will and an assurance that they are as near his heart as his other subjects. The stately and impressive ceremony at Delhi in the presence of an assemblage the like of which the world cannot produce anywhere emphasises this fact and it will undoubtedly forge another strong link in the golden chain which binds India and Great Britain.

The foundations of this loyalty were laid broad and deep by the ever-memorable Proclamation of Queen Victoria, which, in the view of Indians, has done more than the combined achievements of all British statesmen and soldiers in closely interweaving the fortunes of the two nations for a common striving towards a glorious future. There is, as several know, a school of politicians who believe that a strong army, an efficient judiciary

and the necessary measures for the security of life and property are the only essentials for keeping the people of India contented and ensuring the safety of the Empire. The Queen's Proclamation embodied a far higher ideal of the destiny of Indians under the British flag. I have a vivid recollection of the time when the sad news of the Queen's death was received in India. At that time it was part of my duty to watch and report upon the under-currents of Indian feeling as expressed in the Press of the western Presidency. In those days the tone of the vernacular Press was extremely virulent and the unfortunate opinion expressed by some Englishmen that the Great Proclamation was an "impossible charter" was being denounced with an uncompromising and vehement hostility calculated to arouse the bitterest feelings of enmity and hatred against British domination. In the midst of this inflammatory Press campaign was flashed from London the lamentable announcement of the Queen's death. The effect was tremendous and instantaneous. The outburst of grief was as intense as it was universal. The thought never for a moment crossed anybody's mind that Her late Majesty was of an alien race and creed, as the people well know that the great and good Queen had risen above all considerations of race and creed and had exemplified in her person and in her acts the noblest conception of a Sovereign's duty to her subjects of all nationalities without those invidious distinctions so dear to the hearts of some of the servants of the Crown in India. These great and glorious traditions of our first Empress, were fully maintained by her son; and her grandson has already manifested a desire to base the stability of His Throne in India on the solid and safe rock of the affections of his Indian Subjects. We know that the King-Emperor's sympathy and trust are extended to us in an overflowing measure. Let us all re-echo the wish, which doubtless is uppermost in the hearts of our countrymen that a reign of such happy augury and so full of promise for the future may last long!

SIR HERBERT ROBERTS, M. P.

The visit of the King-Emperor and Queen-Empress to India is one of the most notable events of the century.

That India, with its boundless territories and teeming millions, should be under the British flag is a momentous fact in modern history, and it is difficult to measure what mighty issues hang upon the continuance of the ties which bind this vast continent to the English people.

The coming of the Sovereign and head of the British Empire into the midst of his Indian subjects to receive from them, under circumstances of unexampled splendour, the homage of their hearts, will inscribe this fact afresh on the mind of India.

The beneficent reforms proclaimed by His Majesty at the historic Durbar are a living witness to the new spirit of sympathy and understanding which, under the changing conditions of India, will mark the future administration of Indian affairs. And it is with full confidence that we begin a new chapter in the history of India upon the first page of which will be "writ large" the ever-memorable visit of our King and Queen.

MR. FREDERIC HARRISON.

The announcements made personally by the King Emperor fulfil all my hopes of a new era about to dawn in India. In July last in "India" apropos to the banquet given to Sir Krishna Govinda Gupta I urged that the first duties of the Kaiser-i-Ind at his Durbar were (1) to redress the grievance of the Bengal Partition (2) to remit political sentences. He has done both.

But the transfer of the Capital to Delhi is a far more important and memorable act. It will make the Central Government truly Indian—and not so much commercial and British. Calcutta has been to India what "Dublin Castle" was to Ireland. It is the herald of a New India.

THE BISHOP OF LAHORE.

I believe that the approaching visit of Their Imperial Majesties King George and Queen Mary to India will prove of immense value. It is impossible to exaggerate the compliment which is being paid by Their Majesties to India in electing it first of all their great over-sea dominions, to receive the honour of a Royal visit and to hear from the lips of the Sovereign himself, the announcement of his accession to the throne of their great Empire. And I am convinced that the people of India are, by temperament and tradition, able to appreciate to the full that high compliment, and I believe that they will respond to it by an outburst of loyal and hearty welcome throughout the length and breadth of the land which will amaze and confound that small but most mischievous section which has been working against the British Government and brought of late years so much evil and discredit in the land, and will prove to demonstration how wholly true to the British connection the overwhelming masses of the people are, and how truly they regard as their own honoured and beloved Rulers Their Gracious Majesties who are thus revisiting the shores of India within the short space of six years.

DR. V. H. RUTHERFORD.

Little did I think when I outlined from my place in the House of Commons in 1908, Provincial Parliaments and an Imperial Parliament for India that the Government of India would repeat the tale within four years under the aegis of the King. The acknowledgment of the duty of the Government to provide popular education is a great triumph. As is also the remedying of the Partition of Bengal, and the promised release of political prisoners among whom, I trust, Mr. Tilak will be the first. A new light seems to have burst through the bars of India's bondage, and bright vistas of an India, free and glorious makes the heart glad.

LORD KINNAIRD.

The visit of the King-Emperor to India in order to hold the Coronation Durbar will mark a new era in the history of the British Empire and of India. It will show all the peoples of Britain and of India that His Majesty is determined personally to understand the various problems which are calling for a solution and His Majesty has often expressed the opinion that in order to attain this knowledge he must visit all the different parts of His Empire. I believe that the visit of Their Majesties has been a very great success and that the announcements of a new policy which His Majesty made at Delhi will produce most happy results and will bind the hearts and affection of the peoples of India still more closely to their King and Queen.

THE HON. MR. KARANDIKAR.

Shortly stated, the Royal visit has succeeded in winning over to the British Rule in India the hearts of the Indian peoples, such as no Proclamations like that of 1858, could accomplish. The noble simplicity of the King-Emperor and the genuineness present in every word of his important utterances have re-established confidence in Britain's declarations which had of late received a rude shock at the hands of responsible men 'on the spot.' Their Majesties' loving regard for their Indian subjects was manifest in every detail of the various functions in which they took part. The "grant" for education must be regarded as a gift to the nation whereby agricultural India will work her emancipation from ignorance; and while King Edward VII., was the 'Peacemaker,' King George V. will soon be remembered as the 'Liberator.'

DEVAN RAHADUR R. RAGUNATHA RAO.

According to Hindu tradition, there were two Emperors in India contesting for supremacy—neither succeeded in subduing the other. The heads of those Empires agreed to divide India into two parts, viz., one to the north of the Godavari, and the other to the south of it. These were called Shakas of Vikramadithya and Salivahana. Happily there is but one Empire now in India, from the Himalayas to the Cape Comorin. Furthermore its Emperor, His Imperial Majesty King George V, will be crowned as such in December next. This Empire is not acquired and established by British force, but is founded on the affection of the people and the justice of the sympathetic Emperor. There is now, I think, a justification for recording in our calendars this happy change by substituting the Georgian Shaka for those of Salivahana and Vikramadithya. This is so far as India is concerned, but the Georgian Shaka may be adopted in the calendars of many a country all over the globe. The Union Jack is never in the dark, for it is flying during the 24 hours of the day in the light of the sun. Its extent alone is not vast, but its character is also high, equality, liberty and freedom rule over it. Our sacred records tell us that the infinite Empire of God is cared for by His Empress for the good and happiness of His creatures. This, we see, is realised by the fact that Her Imperial Majesty, Empress Mary, is as sympathetic as the Emperor, and as solicitous for the happiness of the peoples under the care of the Emperor, a rare coincidence and therefore, a great satisfaction to the followers of the Hindu religion. May the Empire last for infinite generations to come, is the prayer of the people of India.

MR. ARNOLD LUTON M. P.

Every lover of the human race must be glad that the Emperor of India has paid a visit to that great country, in order to make closer acquaintance with the nations over which he rules. In one sense, it may make one smile to speak of the Emperor as "ruling" India, when we know that, as the constitutional King of England, he cannot give a single important order except in accordance with the advice of his Ministers, who are responsible to the English Parliament, nevertheless, the practical good that will result from this visit will arise from the fact that it will call the attention of the English people and the English Parliament to the affairs of their brethren in India, and perhaps it may hasten on the time when the English elector will cease to think almost exclusively of his own selfish pecuniary gains or losses, and will rise into a higher sphere of thought and find a greater joy than any he has yet experienced in using his great power for the good of nations beyond the seas. England has already advanced far beyond the stage of piracy or semi piracy, when its power was openly and deliberately used to rob weaker nations of their accumulated wealth and crush their industries. No British statesman to day would dare to make a speech advocating any policy with regard to India which did not put forward the welfare of the Indians as its chief object, nevertheless, the time has not yet arrived when the members of the House of Commons, or the great bulk of the electors, think it their duty to give much time or thought to the welfare of that vast population which is subject to the control of the British Government. The people of England believe that India is now being governed in the best possible way by the best possible of Governments, and modestly think that, as they know little about India, the less they interfere in its concerns the better will it be for that country.

It is a happy circumstance, and full of hopeful auguries for the future, that when Lord Morley was Secretary for India some extensions of the principle of representative government were made to that country, and it is to be hoped that this is but the beginning of a long series of constitutional reforms, which will result in giving to the people of India that control of their own affairs which has had such satisfactory results in other countries which have had experience of it. To bring about this state of affairs, it is not necessary to spill one drop of blood, to have one riot or to use rough or hard language. It is only necessary for the Indians of "light and leading" to show by their knowledge, industry and devotion to public affairs that they understand what is necessary for the welfare of their own country, and to be willing to make the personal sacrifices which are necessary for the achievement of any good work. As the love of national liberty grows in India, the people will become less dependent on the central Government for the management of their own affairs, and they will put an end to such foolish interferences with individual liberty as, for instance, that of vaccination, by which the blood of the infants is poisoned and the seeds of many horrible diseases implanted, by which leprosy is spread wholesale, which, moreover, has been proved to be so useless for the purpose for which it was intended. They will object to Government education, believing that the parent is the best judge of what kind of education shall be given to his child. They will reduce the huge military expenditure, knowing that so long as India is part of the British Empire no foreign country will venture to attack her, or could possibly do so with success so long as the Indian army remains safe in the plains, behind the huge rampart of mountains, receiving supplies and reinforcements by sea. India, dependent as she always has been and always must be upon agriculture,

must give her attention to the restoration to fertility of those large areas where the soil is impoverished, and the agriculturist must be relieved of those rents and taxes which press too heavily on his industry.

If these measures are taken, India may become a prosperous country, and its people take a leading place in that "federation of the world" prophesied by the poet Tennyson.

THE HON MR. JUSTICE ABDUR RAHIM.

[The following speech delivered by the Hon. Mr. Justice Abdur Rahim in Madras some months before the Coronation Durbar will be read with great interest at the present moment especially as his happy anticipations have now been more than amply fulfilled *Ed I. R*]

The Coronation Durbar is a most unique event in the history of India, at any rate, for centuries. The coming of Their Majesties to India to celebrate their Coronation is fraught with the greatest significance. That significance is no less than this, that His Majesty wishes to convince the people of this country that they are as much under his August protection and care as the people of the rest of his dominions and that their loyalty and devotion are of as great a value and as dear to him as that of his other subjects, and to enable them to realize that they are no strange inhabitants of an outlying dependency, but occupy a place of dignity and responsibility in the great Empire. We cannot shut our eyes to recent events either here or in Europe, and one fact is noticeable, viz., that there have been vast forces—vast and irresistible forces—working in the life of humanity not only in the East but also in the West, not only in India, but also in England, and that it is quite within the bounds of possibility that India at no distant date will prove itself the strong right hand of England. I am one of those who firmly believe that the connection of India with England is for the great benefit of both, and I feel sure that

the imperial visit will strengthen that connection by bringing into play feelings of mutual respect and cordiality both between the English and the Indian on the one hand and between the different communities living in India on the other. There is another aspect in which this great event may be regarded. There are large classes of people in this continent who are very tenaciously proud of their past. There are men who claim descent from Kings and Emperors, from men who have established and maintained Kingdoms of historic renown, descendants of great poets, philosophers and prophets, and they still reckon amongst themselves men of the finest intellectual and moral calibre. These people are naturally men of great sensibility, and I anticipate that Their Majesties' visit and the celebrations that will take place in connection with their Coronation will have a most happy effect on the feelings of these people.

At the Curzon Durbar of 1903, the autocrat who was then Viceroy of India pleaded inability to receive or to return visits on the ground that such courtesies would, as Mr Lovat Fraser has put it, have "encroached so much on the limited time at the Viceroy's disposal as to be practically impossible within the short space of ten days." Much soreness among the Ruling Princes was the result. They remembered that at Lord Lytton's Proclamation Durbar of 1876-77, that Viceroy found, between December 26 and 29, both the time and the inclination to receive upwards of 72 State visits and to return over 40 of them. The King did not allow a precedent to be made of Lord Curzon's bad example. One of the pleasantest experiences of the Indian Princes and Chiefs at the Coronation Durbar was unquestionably the gracious arrangement made by Their Imperial Majesties to receive State visits from them and to return such visits through the Viceroy to those who are entitled to them.—*India.*

THE CHANGE OF CAPITAL.

[In response to a request from the Editor of this Review for an expression of opinion on the recent announcement of the change of Capital from Calcutta to Delhi, the following have been received for publication.—Ed. I. R.]

THE HON. SIR VITHALDAS
D THACKERSEY.

I am of opinion that the change will have an excellent effect morally and politically. It will be felt throughout the country that by having their headquarters at Delhi the Imperial Government have come into line with immemorial tradition of India. From a practical point of view also the change is extremely desirable. It will, as pointed out by the Government of India in their despatch, reduce the duration and expense of the annual summer term at Simla. The non-official members of the Imperial Legislative Council will find it more convenient to run up to Delhi whether from Bombay, Calcutta, Allahabad or Lahore and they may go back to their places when there is a recess even of three or four days and return in time for the resumption of business. Besides there are so many interesting historical places within short distances of Delhi that a stay at Delhi can be made more useful and instructive than at Calcutta. Delhi industrially has been fast rising into importance and the location of the Imperial Capital will greatly stimulate its further development. The Government of India will be in closer touch with the industrial and economic movements though they may not be closely in touch with the import and export trade as in Calcutta. I have no doubt that newspapers will spring up in Delhi and that all important public movements will have their representatives in Delhi just as they have in London at present so that the fear that the Government of India will not be in touch with public opinion will have only temporary justification.

THE HON. MR. FAZULBHOY
CURRIMBHOY EBRAHIM.

I believe the transfer of the capital from Calcutta to Delhi is fraught with immense advantages to the whole country. Calcutta had long been found to be unsuited to be the seat of the Imperial Government, and the change has long been desired. Apart from the hold which Delhi has on the imagination of the people, it is pre-eminently the place to be the capital city, and by this transfer the Government of India have restored it to its former glory, and have gratified the feelings of the Indians, who whether Hindoos or Mussalmans, have always borne a pride in this Imperial City. It is already a flourishing city with rising trade and commerce, and vast potentialities for the future, and being a great Railway centre, easily accessible from all parts of the country, and being now raised to the dignity of a capital city, will soon develop into a great modern city, the Government will be able to remain at headquarters for a longer period of the year, and thus avoid the inconveniences and delays which long migrations to the hills necessarily entailed, and from its central situation will be able to come into closer touch with such important places as Bombay and Karachi.

I do not believe there will be any material falling-off in the future prosperity of Calcutta. Its trade and commerce will continue to flourish quite independently of the fact that it is no longer the seat of the Government of India, and the resentment now felt will vanish as time goes on and as the people are reconciled to the change.

In fine, I believe this is a master stroke of policy and reflects the highest credit on the minds that conceived it.

THE HON. MR. M. DE P. WEBB.

THE restoration of Delhi as the Capital of India will prove, I think, of great advantage to the whole of India. Not only will the change relieve the Government of India of the diversions and interruptions inseparable from the conduct of their business amidst the ferment of the two Bengals, but it will permit of the creation on the Banks of the Hooghly of a local Government adequate to the size, wealth and population of the chief Presidency, and so promote the peaceful development by all classes of that most important portion of the Indian Empire. Further, the transfer of the capital to Delhi will place the Government of India in a central position to which the representatives of all parts of India can approach with equal facility, and from which the needs of the several Provinces and Ports (with their respective local interests) can be seen in true perspective. This must prove of benefit to the whole in the course of time.

THE HON. MR. LALABHAI SAMALDASS.

THOUGH the question of a change of capital had been a subject of academic discussion ever since the growth of a new India, no serious proposals about the transfer were known to be before the Government and its announcement therefore came as a surprise even to those who seemed on the preceding evening to have got some inkling of the Royal announcement. As I heard His Majesty the King-Emperor read it in clear dignified tones, the first feeling was that of agreeable surprise at the mention of the transfer of the capital. It was followed by feelings of gratification and gratefulness at justice having been done to Bengal, and then there was admiration for the statesmanship that boldly gave a Lieutenant-Governor with an Executive Council to Behar and a Chief Commissioner to Assam. That whole day people in the various camps hardly talked of anything else. When on the same evening

I told one of our leading men who is an Indian first and Bombayite afterwards that Bengal had no reason to complain of the transfer of the Capital as she has got what she would have asked for and that she must put up with any loss that she may have to suffer temporarily due to the administrative change which is a necessary concomitant of their getting a United Bengal with a Governor-in-Council. I was told, "Don't be vindictive, Lalabhai." Our unfeigned pleasure at the Royal announcement is, I emphatically assert, not due to vindictiveness: Bombay has had reasons to complain of undue preference being shown to Calcutta, but it has too much self respect—call it pride if you will—to feel jealous of Calcutta on account of her being treated as the favourite wife. Nor is our approval based on the sordid motives of commercial gains. Without our being under the protecting wings of the Central Government or perhaps on account of it, our public life may without exaggeration be said to have all along been a model for the rest of India to copy. And we hope that the removal of the overpowering presence of the Government of India will lead to a healthy development of the spirit of local self-government not only in Calcutta but in the whole of Bengal. It is true that over and above losing the privilege of being called the Capital of the whole country, Calcutta will suffer a material loss by a depreciation in the value of its property and by its traders losing some big customers. Calcutta must try to bear the loss in a patriotic spirit in the knowledge that she suffers for the good of the rest of the country.

It is said that at Delhi the Government of India will not be in touch with public opinion, as Delhi has no public opinion of its own, and that distant places like Calcutta and Bombay will not have any effect on the work of the administration of the country. I do not look upon this as an unmixed evil. There is every reason to believe that in time to come a public opinion will be created at Delhi which though not as expressive as that of Calcutta may be more representative of the opinion of the whole country.

THE HON. MR. MUSMOHANDAS RAMJI

I WELCOME it as a great statesmanlike measure as it revivifies the memories of the people always connected with this old and historic City and at the same time facilitates the evolution of the Indian Government, outlines of which are suggested in the memorable despatch of H. E. Lord Hardinge. As to the trade and commerce of Calcutta I do not believe that these will suffer to any extent. The three chief articles of industry of Calcutta are Jute, Coal and Tea and I cannot see how any of these will suffer by the change of capital. But Anglo Indian Society will suffer socially due to there being no Calcutta season. The large import trade of Calcutta has piecegoods as one of its chief articles and this too will not suffer by the change of capital. Nor on the other hand will the trade and commerce of Bombay gain anything, as is wrongly supposed by some. Delhi is equi-distant from Calcutta and there is no reason so far as one can see how Bombay will be enabled to steal a march over Calcutta. Sentiment I should think plays a great part in the supposed loss of Calcutta and the supposed gain of Bombay. But I apprehend that if the Indian Mail steamers touch Karachi first and if in future this fast growing port is made the terminus of the Trans Persian Railway, it will divert much trade and commerce at the expense of Bombay.

THE HON. MR. EDWARD ORR

I fully approve of the change of capital to Delhi and of the removal of the Imperial Government from any consequently undue influence by a Local Government. The cost will, of course, be heavy but it will be mostly disbursed in the country. A logical sequence would be the turning of the Punjab Government out of Simla, as proposed by Lord Curzon—but curiously enough I have not seen this referred to by any newspaper.

CORONATION OF HER MAJESTY QUEEN VICTORIA.

CORONATION OF THEIR MAJESTIES KING EDWARD VII AND QUEEN ALEXANDRA.

THE PARTITION OF BENGAL.

[The annulment of the Partition of Bengal by His Most Gracious Majesty the King-Emperor on the advice tendered by the Secretary of State for India and the Viceroy has produced a feeling of joy throughout Bengal and among those who have been keenly sympathising with the Bengalis in their efforts to reunite Bengal. The following expression of views will, we have no doubt, be read with interest. Ed. I. R.]

SIR HENRY COTTON.

None among the great works which have been wrought by the present Liberal Administration redounds more to its credit and will live longer in the memory of the nationalities concerned than the grant of self-government of South Africa and the restoration of internal peace in India, which has been accorded by the revocation of the partition of Bengal, accompanied as it is by the enlightened policy and liberal and sympathetic instinct which breathes in every line of the Government of India's despatch. If our Liberal leaders had done nothing more than this—supplemented next year by a measure of Home Rule for Ireland—they will have done more than any other Government has done or even attempted in assuring contentment and gratitude among nations who have suffered much and long, but are not incapable of the most loyal and grateful feelings towards those at whose hands they have been rendered justice.

MR. C. J. O'DONNELL.

The scheme for the redress of the crime against the Bengali nation follows the lines on which I have fought for six years—lines indicated in my pamphlet, "Is Bengal worth conciliating?" It is difficult to make people in England understand what all this means. The Bengalis are a patient people. They will wait while they have hope; but if hope is banished they have a passion

that we little understand. This act of justice will touch them as they have never been touched. It will echo through India and will restore the prestige of the British name. It is the dawn of a new day in India. And we owe it primarily to that enlightened man Lord Hardinge.

SIR HERBERT ROBERTS.

As one who has for nearly 20 years taken a deep interest in Indian affairs in Parliament, I desire to express my unqualified satisfaction at the announcement by His Majesty the King-Emperor at the Coronation Durbar of the marks of his Royal favour to the people of India.

By universal admission this is not the time to comment in detail upon the far-reaching reforms outlined in this momentous declaration, but I may be allowed to express my personal gratification at the decision of the Government with reference to the modification of the partition of Bengal.

As soon as it became known that steps were being taken to divide the Province of Bengal into two administrative areas, I endeavoured to express in Parliament the strong opposition of the Bengali people to the scheme, and on August 5, 1905, I moved the adjournment of the House for the purpose of discussing the resolution of the Government of India with reference to the partition, and asking for papers.

The consequences of the partition seemed to me to be so serious that, although a change of Government had taken place in the meantime, I thought it my duty to move an amendment to the Address in February 1906, calling attention to the wide-spread dissatisfaction which the measure had produced.

Throughout this controversy I have recognised the difficulties connected with the Government of such a large and populous area as the old Province of Bengal under one administration, but I held that these difficulties could be effectively met by the adoption of the changes which have now been announced.

In the despatch of the Government of India to the Secretary of State the continued and widespread resentment caused by the partition of 1905 is admitted, and it is further stated that 'there was reason to fear that instead of dying down the bitterness of feeling would become more and more acute.' As I have long been painfully convinced of the truth of this statement, I rejoice that through the mouth of the reigning Sovereign this long-standing grievance has been removed, and I feel certain that the historic declaration made at Delhi will be the means not only of beginning a new chapter in the annals of India but of more firmly binding the Indian people to the British Throne.

MR HENRY MACDONALD, M.P.

The readjustment of the partition of Bengal is all to the good, and the confession in the memorandum issued that the partition *has been* a failure will undoubtedly tend to quieten unrest.

MR. S. K. RATCLIFFE.

The reunion of Bengal, coupled with the creation of a new province, is a bold stroke of statesmanship, the full effect of which it is impossible at the moment to foresee. By bringing once again the Bengali-speaking people under one administration it removes the specific evil of Lord Curzon's partition; it satisfies the demand of both the Indian and the European community for a full Council Government, with a Governor from England; it follows the line of advance laid down by the Royal Commission on Decentralisation three years ago, and it creates a precedent full of promise for the future administration of the country. One pregnant passage in Lord Curzon's statement is worth quoting - "It is certain that in the course of time the just demand of Indians for a larger share in the Government of the country will have been satisfied. . . . The only possible solution of the difficulty would appear to be gradually to give the provinces a larger measure of self-government, until at last India

would consist of a number of administrations autonomous in all provincial affairs, with the Government of India above them all." The courage and originality of the scheme declared by His Majesty is evidence that this passage is much more than *expression of pious opinion*. It foreshadows a new era in which, if the intention of the King and his advisers is loyally put into effect, the old unhappy era of nigardliness and suspicion will be overpast and forgotten.

SIR WILLIAM WEDDERBURN.

This is glorious news: quite beyond not only what I expected but what I hoped for.

SIR MANCHERJEK SHOWNAGORE, K.C.I.E.

The modification of the partition scheme is certainly a wise act of statesmanship, and will go far to assuage the irritation caused by a policy whose object was believed by many to be the creation of *disunion* among the population of Bengal.

RAJAH PEARY MOHUN MUKERJEE.

The boon which has been conferred upon the people of Bengal by the reunion of our divided province and by its elevation to the status of a Presidency Government has stirred the hearts of our people and has filled them with the deepest gratitude. The partition of Bengal has always been felt as a great national grievance. It was the root of the unrest which in some of its most objectionable features we all deplore and lament. It had alienated Hindus from Mahomedans and had proved a veritable apple of discord in our midst. All this has now been undone, and what we had long hoped from the sagacity, the breadth of outlook, the provision and the justice of the statesman has now been done by the beneficence of our Sovereign.

The result of the change involved in His Majesty's mandate will be inestimable and far-reaching. It will symbolise the Royal visit, the most momentous event in the annals of India, it will fuse the whole Bengalee speaking-people,

Hindu and Mahomedan, in a harmony of good will and fellowship, it will win back those misguided men who were partially drifting out of sympathy with the British rule, it will show our local Rulers how easy it is to win the gratitude and affection of the people and that even a Royal concession to the wishes and prayers of a united people is not calculated to lower the 'prestige' or weaken the autocratic authority of British Indian Administration and lastly, it will stimulate the industries and present at no distant date the prospect, in the language of Lord Minto, of an 'industrial India, wealthy India and contented India.'

RABU AMBICA CHARAN MAZUMDAR.

What repressive laws, proscriptions, prosecutions, and deportations have failed to achieve in six years, the kindly touch of the Royal prerogative has accomplished in one minute. I repeat what I have recently said elsewhere, that if on the 23rd June, 1757 the Battle of Plassey paved the way to the conquest of India by the British arms, the Coronation Durbar of George V. at Delhi on the 12th December, 1911, has led to the conquest of the hearts of the Indian people by the British Throne. If Edward VII. saved South Africa, George V. has saved India, the brightest jewel in the British diadem. Gentlemen, while we are profoundly grateful to His Majesty, we cannot be unmindful of our deep debt of gratitude to those statesmen whose wise counsel and sound advice were instrumental in bringing about the present joyous occasion. The despatches of Lord Hardinge and of the Marquess of Crewe have now been made public, and it is no longer necessary to point out how those important documents prepared the ground upon which the monumental boon modifying the partition of Bengal has been based. I am no prophet; but it requires no gift of prophecy to foretell that Lords Crewe and Hardinge will go down to grateful posterity as the saviours of Bengal and the Bengales nation.

MR. T. P. O'CONNOR, M. P.

The reversal of the partition of Bengal reaches the people of India after a fashion much more solemn and impressive as it comes from the lips, and under the most solemn surroundings, of the King. Everybody looks to a great tranquillisation of Indian native opinion from the bold and impressive act, and to that extent all sound Liberals in the House of Commons have received the news with gratification. The truth is that Liberal opinion is gradually coming to the conclusion that we must depart—gradually and cautiously, of course—from the old policy towards India. It is impossible to apply to a nation which is being gradually educated the old methods of irresponsible and entirely unrepresentative Government. Democratic thought looks to the gradual devolution to the Indians themselves of a greater share in the management of their own country and their own people. It is these views which derive so much satisfaction from the momentous pronouncements of the King in India. They mark the beginning of a new epoch, and a new method, and a new point of view.

MRS. ANNIE BESANT.

A truly imperial and statesmanlike act, the act of a Ruler strong enough to be just, advised by a Councillor worthy of the Ruler. In closing the gulf between the two Bengals, the Monarch has closed a gulf that yawned between two races, and Lord Hardinge has won for himself a fame which will endure. Nor must we forget the Marquess of Crewe, who assented to the change which his predecessor refused.

"It has been said, and repeated since the momentous Durbar announcement was made, that the partition of Bengal was not responsible for the anarchy in the province. But most people who know take the contrary view; and if they are wrong, all that can be said is that the coincidence is the most striking in the long and varied history of the country. That the rectification of the blunder will carry a great influence for good there is not the slightest doubt, and those who have been responsible for it deserve well of Bengal and her people."—A Correspondent to the "Sheffield Telegraph."

The Coronation Durbar.

[It is difficult to convey to the reader even in a faint manner an idea of the splendour and magnificence of the great Coronation Durbar held at Delhi in December last. It is hoped that the following brief accounts of the great historic ceremony, selected from among others, will be of some help in enabling the reader to realise even to some extent, the real magnitude and import of the Coronation Durbar. Ed. I. R.]

MRS. ANNIE BESANT.

The scene at the Coronation Durbar, with the dresses of cloth of gold and of silver, the costly brocades and embroidered silks, the glittering gems of incalculable value, the golden scabbards and jewelled hilts of swords, was certainly one to dazzle the eyes; while the huge crowds which covered the vast sweep of the raised mound enclosing the Durbar ground, their many-coloured turbans making the expanse look like a flower-garden of varied hues, the 20,000 soldiers, horse and foot, who filled the space from the mound to the golden posts encircling the Royal enclosure, the amphitheatre with its ranks upon ranks of Princes, Nobles and "privileged spectators"—all these impressed the imagination as the symbols of a mighty Empire. And when the two lonely figures who embodied that Empire sat, raised aloft, on golden thrones, the incarnations of Imperial Majesty, the heart went out in fervent wish that Ishvara, by whom Kings reign, might overshadow them, and enable them to bear the heavy burden of their world-wide rule.

Dramatic above all others was the moment when—after homage had been rendered, proclamation had been made, clarion notes of silver trumpets had shivered the air, guns had thundered—the Imperial pair returned to the Durbar Shauri-ana, and, after sitting for a moment in silence, the King-Emperor rose, and in a clear strong voice

proclaimed his pleasure that the Imperial City should be his Capital, and Bengal re-become one. It was as though the Royal Pandavas had linked hands with the great Moghals, and surrounded the younger Throne, blessing its occupant, and seeing their ancient glories re-blooming on their own fields of fame. Then to Delhi returned her long lost diadem, and she became the symbol of United India, of an India vaster and more united than she had ever ruled, stretching from the Himalayas to Ceylon, from Quetta to Assam. As I glanced at the Rajputs among whom I was sitting, many in their short full skirts, with heavy sabre, bossed targe slung over the left shoulder, and costly jewel gleaming in the close-wound turban, I wondered what memories stirred in them of the older days, of the shock of Rajput charge, of saffron robe, of fire eager for its prey. What history matches that of India for romance and chivalry, for reckless daring and generosity to a vanquished foe? It all seemed swinging in the air round me as I sat in the white amphitheatre with the crimson canopy upheld by golden pillars, and the encircling posts and chains of gold, glittering in the brilliant sun. O fleeting earthly pageants, and age-long processions of crowned Emperors and Kings!

There were incidents in these gorgeous Delhi days, however, that touched the heart more than these splendid pageants. The King-Emperor was leaving the Polo-ground on foot, strolling over towards his carriage. As he came to the road there was a great rush of the poor people, who had gathered thickly in the hope of seeing one who, to the Hindu, is very God on earth. Not unnaturally, perhaps really alarmed for his safety, the police and soldiers pushed them roughly back. But quickly the Emperor raised his voice and checked the men, bidding them let the people come near. Encouraged by his smiling face, they crowded round: "Oh! stand and let us see you." And he stood smiling, the good

CORONATION OF THEIR MAJESTIES KING GEORGE V AND QUEEN MARY III.

HER MOST GRACIOUS MAJESTY QUEEN VICTORIA
THE FIRST EMPRESS OF INDIA.

THEIR MOST GRACIOUS MAJESTIES KING EDWARD VII AND QUEEN
ALEXANDRA, THE SECOND EMPRESS AND EMPRESS OF INDIA.

Emperor with his fatherly heart, and his poor gazed their full. Again, at the Garden Party at the Fort, he and his Empress took the trouble to put on their Royal robes and Crowns that the vast crowds of the poor, gathered on the plain which stretches from the foot of the wall to the river, might see their Monarchs clad in Imperial garb; the crowd cheered and cheered again, and their faces were a sight to see. Then they disrobed, to walk again amid their guests in ordinary dress.

SARATH KUMAR GHOSH.

A few days of thought were necessary to the right appreciation of the lessons of the Durbar. The Durbar pronouncements regarded in themselves, were not sufficient to inaugurate a new era in the history of India; but now Lord Hardinge's despatch, as elucidating the pronouncements, does seem, on due thought, to be so sufficient. The whole argument now raging so intensely throughout India is focussed on the promise of autonomy contained in the despatch. If that be granted then this indeed is the beginning of a new era.

And I pin my faith on the promise of autonomy.

Verily, I have temptations pulling me towards doubt and disbelief; and the devil is whispering into my ear that there is no such definite promise in the said despatch; that at most it is but a pious hope, the fulfilment of which may be deferred to the Greek Kalends; nay, that if at all a promise, it is one of those promises "made to the ear, and broken to the hope." But the tempter shall not persuade me to waver in my faith. These are the causes of my faith, which would fain reveal to my countrymen who may be in doubt.

First. In the recent vindication of the success of Indian administrators in a Native State by the acting Lieutenant-Governor of Bengal I had read signs of a larger application. Autonomy for British provinces is precisely that.

Secondly. Lord Hardinge's despatch should be interpreted by its entire spirit, and not read solely in regard to the particular passages dealing with autonomy. The despatch repeatedly manifests an earnest desire to seek and find something that would render the Durbar, and the King-Emperor's visit memorable and unique, something that would satisfy Indian aspirations and "strike the imagination of the people of India." I had hoped that at the Durbar the King-Emperor would claim the allegiance of India as her own Emperor not alien—in the heritage of Akbar and Prithviraj. In the despatch there is such an appeal to the hallowed memories of Mahomedan and Hindu alike. Moreover, Lord Hardinge concludes with the actual phrase I have so often used—"a new era in the history of India" as the high aim of the Durbar and the King-Emperor's visit. In this regard I may now mention that frequently in London in the past six months I had occasion to ask prominent politicians and officials if anything would really be done to inaugurate "a new era." We have now the answer, at least in the earnest desire to that end.

Thirdly. Lord Crewe's reply in acceptance, sympathetic as it is, should be supplemented by collateral facts. To take a single point, Lord Hardinge explained the real and practical grievance of Bengalis in being in a minority in the Legislative Councils of both the Bengals. That is what appealed most keenly to Lord Crewe's sense of justice. I remember his speech in the House of Lords on the Parliament Bill, when he led the Liberal Peers who were in a hopeless minority: "Noble lords on this side of the House realised the depressing effect of being always in a minority." Then subsequently Lord Crewe sees precisely the same grievance in Bengal. So we have now a Secretary of State whose sense of justice towards India has been aroused in a manner that he appreciates feelingly. Where.

fore I see cause to hope that so long as he is in power, with Lord Hardinge as Viceroy, the promise of autonomy will not be made void—rather it will receive some fresh sanction, and in the near future.

Fourthly. The condition of affairs in Great Britain must be taken into account. I have to impress that on the minds of my countrymen. Indian affairs are not, and never will be, considered by responsible Britons apart from British interests. For better or for worse British statesmen think and must think, of the interests of Great Britain first, in all that they do for India. Sometimes the interests of India and of Great Britain are identical: in that case India is thrice fortunate.

And this is that case. There is now a general feeling, vague though it be, among the British public, that India must be reconciled in the best interests of Great Britain and the whole Empire.

Let us consider this fully, deeply, and above all, truthfully and fearlessly. In the judgment of most Indians the British public seem to be utterly indifferent to India, many of them indeed are, and their callousness is unconquerable: for they have no tie with India, intellectual, moral, social, or economic. But the vast majority are not so indifferent. Unacquainted with Indian affairs they undoubtedly are; and even the intellectual Britain takes his casual opinion of Indian matters from the party paper he reads. But indifferent to India's fate the general British public are not even from motives of self-interest—to descend to the lowest plane; for the bulk of them are indeed affected directly or indirectly by India's prosperity. Even for that, if for no other reason, they desire to know more about India—if the information be at hand and to wish for India's peace and prosperity and happiness. As there is much misconception in India regarding this, I have to say, although I should not, that I am best fitted to maintain that fact—having shared their most intimate life for

fifteen years, alike in feudal castle and in cottage. To the average Briton, provided he has no prejudice, India is still the home of romance and mystery and fascination. For ten long years, while others were reaping in India what they had not sown, I have gone among the people of Britain, teaching them the ideals of India, the lessons of our ancient heritage, and our new life and new aspirations begotten by the union of Britain and India. "Assure us that you would not use it to break away from us—and we shall grant you Home Rule to-morrow, as a part of a great scheme of Imperial Federation." That was said to me after my lecture in every town in Great Britain—by artisans and by Primrose dames. Some of those dames are in Delhi now.

And I gave the assurance for myself absolutely; for others on the hypothesis that they were not invincible fools. "Give us the autonomy—and we shall be the staunchest members of the Empire, for we shall then have a stake in that Empire. All of us are not fools. We realise that India has need of Britain, and shall have for some time to come. For we have still much to learn from Britain."

Thus I have come to believe that in their inmost hearts the British public do desire to sanction the autonomy and very soon.

It is true indeed that a few years ago they may not have done so; but now events are marching with grand strides. Perchance there is also the vague consciousness that in turn Britain may have need of India's affection and ardent co-operation in the work of the Empire—as I have pointed out elsewhere. ("The Prince of Destiny.") In ten more years the Anglo-Japanese alliance will be ended never to be renewed. And in ten more years Germany will have fifty per cent. more men than Britain: and having more men and at least equal economic efficiency, she will have more money—and the things of steel and iron on land and sea that money can build or buy. In that hour

India will show her gratitude to Britain for having awakened her to this new national life.

Is the Emperor of India to-day the truest friend of the King of Great Britain to-morrow? Is that in part his mission in India? Then is the Durbar in part the fulfilment of a far-seeing statesmanship—and a new fortress on the North Sea. Then by that token let us rejoice and hope, but also labour and strive worthily in the cause of a United Empire.

MR. HAROLD COX, M. P.

The visit of the King has been a brilliant success is the verdict of everybody. On all sides one hears but one opinion. Some people proudly say they knew all along it would be a success; others more modestly admit that the event has surpassed their hopes; but all agree in saying that the success has been complete. That by itself is a very big result. Consider what the visit meant! It was absolutely unprecedented. No English Sovereign had ever before left England to visit his subjects across the seas. There were grave shakings of the head among the pundits at home when the King announced his intention of going to India. Even those who were engaged at the moment in a purely destructive attack upon the British Constitution, expressed alarm lest that Constitution should suffer if the King were absent from England for three months. Others suggested more plausible objections, and it is an open secret that the King's visit to India would never have taken place if he had not persistently pressed it upon reluctant ministers. They were perturbed about precedents; he was prepared to make history. And he has made it. The visit of the King-Emperor to his vast Indian dominions has brought home the reality of his sovereignty in a way that nothing else could have done. Imagine the positions reversed, and England governed from India! Would English people under such conditions be content that their Sovereign should never visit them but should be kept cooped up in

Hindustan on some plea of constitutional propriety? By insisting upon visiting India to announce his coronation, King George V has demonstrated in a manner that all can understand, that he is Emperor of India as well as King of England.

To have done so much is a great thing, but King George has done more. He has enabled his subjects here, whether English or Indian, to get a glimpse of his own personality. They have learnt that he is neither a puppet nor a figure-head; that he has clear views of his own upon the problems of his great empire; and that though his action is necessarily circumscribed, his influence can be, and is freely exercised.

Not less important is it that the people of India should know that they have an Emperor, who personally understands their problems and who can use his wide knowledge for their welfare. Ministers at home come and go, and they are always more concerned to listen with their ears to the ground for the growl of the British electorate than to study the interests of a vast and distant population that has no votes. Here the King can exercise an influence which may be of the utmost importance to the whole Empire. He knows more of India than any one of his present ministers, and the visit which is now coming to an end has added not a little to his knowledge. While the King has been in India he has not contented himself with the punctilious discharge of public functions; in addition he has made a point of conversing privately with princes and high officials and leaders of Indian opinion; he has learnt their views at first hand and thus has been able to acquire, in a very brief period, an extensive knowledge of Indian problems. It may be added that the Queen has been not less sparing of herself and has interpolated between her public appearances numberless interviews with Indian ladies. All this has acted and reacted upon Sovereign and People. It has enabled the

Sovereign to understand his Indian people better than before; it has enabled the Indian peoples to realize more fully that King George is their friend as well as their Emperor. That this knowledge has spread through all classes no one can have any serious doubt. The scenes of enthusiasm at Delhi are still in the minds of all of us; but the popular demonstrations in Calcutta have been even more striking. The enthusiasm of the vast crowd on the maidan on Friday when the King and Queen drove round almost unattended was one of the most impressive incidents of the whole visit. The people were wild with delight at the presence of the Emperor in the very midst of his subjects.

Nor is there any reason to fear that the impression which King George has produced on the popular mind will prove evanescent. Prominent among the virtues of Indian people is their persistent memory for old friends. Many an Englishman finds himself warmly welcomed in India to-day because the name of his grandfather is still fresh in the memory of those among whom he worked. We may, therefore, confidently hope that the work accomplished by King George and Queen Mary will last for considerably more than one generation. They have won the hearts of their Indian people not for themselves alone but for England.

THE BISHOP OF BOMBAY.

I must own that I went to Delhi full of misgivings. I disliked the feeling of so much money being spent on show and pageantry in a year of scarcity, if not famine. Apart from that I was very doubtful what good purpose all this pomp of power would serve. Ceremony is hollow and futile which does not symbolise an idea. The Durbar could not, I feared, be the festival of an idea, for there is one idea of which the British Rulers of India at present are generally and clearly conscious. But I have to admit now that since I have been there and seen the Durbar, my mind is

changed. Partly the late rains which beyond expectation have saved the winter crops in the Deccan and given promise of a really good harvest in the Punjab materially modified my sentiments about the policy of holding the Durbar in a famine year. Rarely have I felt more thankful to God "to Whom every desire speaketh" than for that most unlooked for rain. But to return to the Durbar, I had not realized one factor in it which after all is the determining factor, the intense desire of thousands of Indians to see the King Emperor, and the great store they set by the sight of him. There was an idea which the Durbar could represent Indian devotion to the personal Sovereign. Indians do not cheer as a European crowd cheers, but no European crowd after the Durbar had broken up, would have gone and kissed, or otherwise done reverence to, the throne where the King had sat, as thousands of Indians did. What struck the Western spectator most was the joy and devotion of the countless multitude which had come to see the Emperor. There was in it a sense of religious veneration. "They expect the sight of the Emperor to bring some great blessing into their lives," an Indian explained to me.

DR. CLIFFORD

King George's messages have brought peace and goodwill, hope and happiness. Balm has been poured into the wounds of Bengal. That vast Province is one again. The fires of discontent will be put out; and though the capital is removed from Calcutta to Delhi, Calcutta will be the centre and head of Bengal. But the gift that has gladdened the patient and valiant band who have for years fought through cloud and storm, contempt and scorn, for a better India, is the promise of the development of self government: "until a last India will consist of a number of administrations, autonomous in all provincial affairs, with the Government of India above them all, and possessing power to interfere in cases of misgovernment, but ordinarily restricting their functions to matters of Imperial concern"—this is, if words mean anything, the gradual evolution of Home Rule for the whole of India.

NATIVE PRINCES PAYING HOMAGE TO HIS MAJESTY.

THE PEOPLE'S THRONE: HIS MAJESTY PROCLAIMING BOONS THROUGH THE VICEROY.

THEIR MAJESTIES IN INDIA.

AT 8-10 A.M. on 2nd December 1911, the *Medina* with Their Majesties the King-Emperor and Queen-Empress on board was signalled from the Prong Lighthouse. Three guns were fired from the saluting battery at an interval of ten seconds immediately on signalling.

ARRIVAL IN HARBOUR.

The Imperial Yacht, *Medina*, entered Bombay harbour at 9 30 A.M. The *Medina* was followed by His Majesty's Ships *Defence*, *Cochrane*, *Argyll* and *Natal* in a line.

THE LANDING IN BOMBAY.

The first of the day's proceedings may be said to have begun with the arrival at the Bunder of H. E. the Viceroy, who proceeded with H. E. the Naval Commander, Sir Edmund Slade, and their respective staff, on board the *Medina*. H. E. the Governor of Bombay motored to the Appollo Bunder and was similarly received by a guard-of-honour, and then proceeded to the *Medina* where he was to be presented to Their Majesties by His Excellency the Governor-General. At 3 50 Their Imperial Majesties, attended by the Royal suite, left the *Medina*, and arrived at the Bunder steps at 4 P.M., and were received by H. E. the Governor-General. Their Majesties were conducted to a specially erected 'pavilion' where they were received by Sir George Clarke and Lady Clarke, H. E. the Naval Commander-in-Chief and Lady Slade, the Chief Justice, and other high Government officials.

THE KING'S REPLY TO THE MUNICIPAL ADDRESS.

Their Imperial Majesties proceeded from the pavilion to the dais in the amphitheatre. An Address of Welcome was presented to Their Imperial Majesties by the President of the Municipal Corporation, Sir Pherozeshah Mehta.

In the course of the reply to the Address His

Majesty said :—

Six years ago I arrived, indeed, as a new-comer. But the recollection of your cordial and sympathetic greeting is still fresh in my memory. The wondrous aspect disclosed by the approach to your shores, the first glimpses of the palms rising, as it were, from the bosom of the sea, have not been forgotten and have lost none of their fascination for me. From Bombay I set forth in 1905, encouraged by your affectionate welcome, to traverse, at any rate, a part of this vast country and to strive to gain some knowledge of its people. Such knowledge as I acquired could not but open my sympathy with all races and creeds, and when, through the lamented death of my beloved father, I was called to the Throne of my ancestors one of my first and most earnest desires was to revisit my good subjects in India. It is with feelings of no common emotion that I find myself here again to-day with the Queen-Empress at my side and that desire fulfilled.

THE PROGRAMME IN BOMBAY.

Their Imperial Majesties spent the next day, Sunday, very quietly. Landing at 1-30 they motored to Government House, where H. E. the Governor gave a luncheon in their honour, about thirty guests being invited to meet Their Majesties. The King-Emperor and Queen-Empress then returned to the *Medina*. They landed again in the evening and proceeded, with a Cavalry Escort, to St. Thomas's Cathedral. It was not a State Service, Their Majesties attending in the evening as ordinary worshippers. The hymn "Abide with Me" was specially included in the Service at their request. The Cathedral was crowded and the Lord Bishop of Bombay preached. At 5-15 Their Majesties left the Cathedral, driving through Church Gate Street and Esplanade Road to the Bunder, and re-embarked at 6-30 P.M., under a salute.

Their Majesties paid a visit to the Caves of Elephants on the 5th and left for Delhi the same night.

THE DELHI CORONATION DARBAR.

The ancient capital of Hindus and Moguls had the honour of receiving the King-Emperor and Queen-Empress on the 7th morning and right royally the event has been staged. By sunrise, the multitude was afoot to take up their positions along the roads, and motor cars jostled with

country carts in long streams, which poured from every point of the compass towards the Fort. A cheerful throng of enthusiastic subjects gave a loyal welcome to the King and Queen.

THE ARRIVAL

The Royal Specul, hauled by one huge engine, slid smoothly into the station at Selimghur and the King-Emperor, in Field-Marshal's uniform, with the Star of India riband, was the first to alight. The Queen Empress wore a soft white satin dress, with a design of sprays, roses and blue bows, the Order of the Garter and Crown of India, and a sapphire and diamond brooch, and a hat of white straw with shaded blue feather. Their Excellencies the Governor-General and Lady Hardinge advanced and received Their Imperial Majesties, and the Hon'ble Diamond Hardinge, their little daughter presented a bouquet of flowers to the Queen. All was excitement and commotion. The Guard of Honour presented arms, the Band played the National Anthem, and a Royal Salute boomed out from the ramparts of the old Fort and notified the Royal arrival to hundreds of thousands waiting along the route.

Immediately afterwards a *feu de joie* was fired by the troops lining the route, and ran in a diminishing *nuendo* out through the Delhi Gate until the sound lost itself in the distance behind the Jumma Masjid, to revive as the troops lining Chandni Chowk took it up, and disappeared again for quite an appreciable period, as it traversed the four miles of troops right up the Ridge, whence it returned in a *crescendo* back through the streets and the Delhi Gate to the steps below the station, where it started. Here, meanwhile the introductions were proceeding. The members of the Indian Staff of Their Majesties were first presented. The high officials from the Governors of the Provinces downwards were then successively presented by Lord Hardinge to Their Imperial Majesties. The King-Emperor then

inspected the Guard of Honour, and the whole assemblage walked from the station to the chief Reception Tent inside the Fort. The Royal Standard fluttered out from the flagstaff on the tower, and a Guard of Honour of the 16th Rajputs presented arms.

PRESENTATION OF NATIVE CHIEFS.

In the Reception Tent there were present the whole of the great Feudatories of India, who were presented to Their Imperial Majesties, the Master of the Ceremonies reading out the names and titles. First came the young Nizam, then followed the Gaskwar, the Maharajahs of Mysore, Kashmir, the Maharajah Scindia of Gwalior, the Maharana of Udaipur, and a host of others.

THE ROYAL PROCESSION

The Royal Procession was then formed, with Their Majesties in the centre, and wound its way through the escorting ranks out through the Delhi Gate, and into the Khas Road, gay with bunting, and lined on both sides with huge crowds of saluting wondering spectators, cheer breaking upon cheer as His Imperial Majesty passed the Big Stands, where European visitors were congregated.

THE PEOPLE'S ADDRESS.

Slowly the great Procession wound its way round the Jumma Masjid and up the thronged aisles of Chandni Chowk, where the enthusiasm reached its climax. The end of the Procession was still emerging from the Fort as its head reached the Mori Gate. The Boulevard and Rajapur Road were passed, the ascent of the Ridge was climbed, and on its summit under the shadow of the historic, but ruined, Charbagh Mosque Their Imperial Majesties were introduced to what was perhaps the most striking feature of the opening pageant. A circular pavilion, seating 4,000 spectators, spread out curved arms to meet them. Here Their Imperial Majesties received a tremendous ovation.

THE KING'S REPLY.

The Hon. Mr. J. Jenkins read an Address on behalf of the people of British India and His Majesty in replying said:—

I know from my Governor-General what strength and support he receives from the wise experience of the Members of his Legislative Council, the chosen representatives of British India. I much appreciate the welcome you offer us on behalf of its peoples. Rest assured that there is no wish nearer to our hearts than that in the words of your Address the Indian Empire may continue steadily to advance in the ways of peace, prosperity and contentment.

RECEPTION OF THE RULING CHIEFS.

In the afternoon and at intervals on the two succeeding days His Imperial Majesty the King-Emperor received visits in State from the Ruling Chiefs in the Reception Tent. The visits of such of the chiefs who were entitled to the honour were returned by H. E. the Governor General. The Indian ladies, consorts of the Ruling Chiefs and others were also received by Her Majesty the Queen-Emress. They presented her with an Address of Welcome, and Her Majesty in the course of her reply pointed to the beautiful jewel she was then wearing which had been presented to her by the women of India on her last visit as Princess of Wales.

UNVEILING THE EDWARD MEMORIAL TABLET.

The greatest event of the second day of Their Majesties' arrival at Delhi—8th December 1911—was the unveiling of the All-India Memorial Tablet to the late King Edward VII., in the centre of a well-laid out garden, which was specially created on the Delhi Maidan between the Fort and the Jumma Masjid. The tablet is to form the foundation of the large bronze statue that is to be set up at the spot. In the presence of a large concourse of people, Feudatory Princes, Heads of Administrations, high officials, and other subscribers to the Fund, Lord Hardinge stepped forward to read an Address, in which he said that in "the statue that is to adorn this pedestal will be enshrined a lasting pledge of the gratitude of the many millions of your Indian people for the

peace, justice and prosperity that prevailed during the late King-Emperor's all too short but strenuous reign."

His Imperial Majesty, in reply said:—

The Address which you have just read has touched my heart and awakened memories of what we all, and I most of all, owe to my dear father, the late King-Emperor. He was the first of my House to visit India, and it was by his command that I came six short years ago to this great and wonderful land. Alas! little did we then think how soon we should have to mourn his loss.

You tell me that this Memorial represents the contributions, not only of a few who may have had the privilege of personal acquaintance with my father, but of thousands of his and my people in India. I am glad to know that the deep and abiding concern which he felt for India has met with so warm a response from the hearts of her children.

I rejoice to think that this statue will stand a noble monument on a beautiful and historic site to remind generations yet unborn of your loyal affection and of his sympathy and trust, sentiments which, please God, always will be traditional between India and the members of my House.

Sunday, December 10th, was observed as a day of rest in the Camp, and a Military Parade Service, which was a feature of the Lytton and the Curzon Durbar, was held in the morning on Jagatpur Island opposite the Delhi Garrison Troops Camp. Fifteen hundred civilians and the whole of the British Troops in the Coronation Camp were present.

On Monday His Imperial Majesty presented colours to a number of Regiments—British and Indian—on the Polo Ground and it was one of the most imposing functions of the Coronation Durbar. Representative Detachments from all the Corps then in Delhi were present. The Composite Division, the special representative units of regiments of which the King-Emperor is the Colonel-in-Chief, and the veterans lined the route. The Guards of Honour were furnished by the Worcestershire Regiment and Sikh Pioneers. The British Regiments selected for the honour of receiving new colours from the hands of His Imperial Majesty were drawn up in a hollow square on the West Polo Ground under the command of Major-General Young. The Indian Regiments, designated for similar

honour, namely the 90th Punjab and 18th Infantry, were drawn up side by side on the east Polo Ground in line of a quarter column of double companies under the command of Brigadier-General O'Donnell. The new colours were displayed on the regimental drums, which stood, in the case of the British Regiments inside the square, and in the case of the Indian Regiments, in front of the columns. The Bishops and Clergy took up their places beside the drums. The Governor-General and suite escorted by the 1st Dragoon Guards and 11th Lancers arrived shortly before 10. His Imperial Majesty on horseback escorted by the 13th Hussars and Jacob's Horse arrived soon afterwards and took up a position near the Royal Standard. The Guards of Honour presented Arms and a Royal Salute was fired. His Imperial Majesty then inspected the Regiments in the hollow square and afterwards dismounted, and the imposing ceremony was gone through. The new colours presented to the Regiments were proudly escorted to their place of honour and the old colours were removed after they had been marched past the ranks. A similar ceremony took place in connection with the Indian Regiments but in this case the religious ceremony was omitted.

THE IMPERIAL DURBAR.

The solemnity of the Coronation of His Imperial Majesty King George V. was announced on the 12th with unparalleled magnificence in the presence of the King-Emperor and Queen-Empress in Durbar. Martial pomp, and brilliant splendour did all that was humanly possible to make this great Imperial event worthy of the history, traditions and sentiments of the Indian Empire. The entire ceremony was carried out with the dignity befitting the occasion. The arrangements had all worked smoothly, the great underlying fact of the joining of a united India in homage to one Ruler was brought out impressively,

effectively, and with pictorial accessories that will make it memorable for all time.

After the opening of the Durbar His Majesty in the course of his speech said :—

It is a sincere pleasure and gratification to myself and to the Queen-Empress to behold this vast assemblage and in it my Governors and trusted officials, my great Princes, and representatives of the peoples and deputations from the Military Forces of my Indian dominions. I shall receive in person with heartfelt satisfaction the homage and allegiance which they loyally desire to render. I am deeply impressed with the thought that a spirit of sympathy and affectionate goodwill unites Princes and people with me on this historical occasion.

CORONATION BOOKS.

At the conclusion of the gracious speech of His Majesty the King-Emperor, on 12th December 1911, on the opening of the great and historic Durbar, Lord Hardinge rose and read His Majesty's Gracious Commands, which were received with continued cheering. He said :—

A GRANT FOR EDUCATION.

To all to whom these presents may come by the command of His Most Excellent Majesty George V., by the Grace of God, King of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the Seas, Defender of the Faith and Emperor of India, I, his Governor-General do hereby declare and notify the grants, concessions, reliefs, and benefactions, which His Imperial Majesty has been graciously pleased to bestow upon this glorious and memorable occasion. Humbly and dutifully submissive to His Most Gracious Majesty's will and pleasure, the Government of India have resolved, with the approval of His Imperial Majesty's Secretary of State, to acknowledge the predominant claims of educational advancement and have decided, in recognition of a very commendable demand, to act themselves, to make education in India as accessible and wide as possible. With this purpose it is proposed to devote at once Rs. 50 lakhs for the promotion of truly popular education, and it is the firm intention of the Government to add to the grant now announced further grants in future years on a generous scale.

CONCESSIONS TO THE ARMY.

Graciously recognising the signal and faithful services of his forces by land and seas, the King-Emperor has charged me to announce the award of half a month's pay of rank to all Non-Commissioned Officers and men and Reservists, both of his British Army in India and his Indian Army, to the equivalent ranks of the Royal Indian Marine and to all permanent employees of Departmental or Combatant Establishments paid from the Military Estimates, whose pay may not exceed the sum of Rs. 50 monthly.

Furthermore, His Imperial Majesty has been graciously pleased to ordain that from henceforth the loyal Native Officers, men and Reservists of his Indian Army, shall be eligible for the grant of the Victoria Cross for valour, that the membership of the Order of British India shall be increased during the decade following this, His Imperial Majesty's Coronation Durbar, by 52 appointments in the First Class, and that in mark of these historic ceremonies, fifteen new appointments in the First Class and nineteen new appointments in the Second Class shall forthwith be made. That from henceforth Indian Officers of the Frontier Militia Corps and the Military Police shall be deemed eligible for admission to the aforesaid Order, that special grants of land or assessments or remissions of Land Revenue, as the case may be, shall now be conferred on certain Native Officers of His Imperial Majesty's Indian Army, who may be distinguished for long and honourable service, and that the special allowances now assigned for three years only to the widows of the deceased members of the Indian Order of Merit shall, with effect from the date of this Durbar, hereafter be continued to all such widows until death or marriage.

Graciously appreciating the devoted and successful labours of his Civil Service, His Imperial Majesty has commanded me to declare the grant of half a month's pay to all permanent servants

in the civil employ of Government, whose pay may not exceed the sum of Rs. 50 monthly.

BADGES AND PENSIONS.

Further, it is His Imperial Majesty's Gracious behest that all persons to whom may have been or hereafter may be granted the titles of Dewan Bahadur, Sirdar Bahadur, Khan Bahadur, Rai Bahadur, Khan Sahib, Rai Sahib or Rao Sahib shall receive distinctive Badges as a symbol of respect and honour, and that on all holders present or to come of the venerable titles of Mahamahopadhyaya and Shams-ul-Ulma shall be conferred some annual pension for the good report of the ancient learning of India.

GRANTS OF LAND.

Moreover, in commemoration of his Durbar and as a reward for conspicuous public service, certain grants of land free of revenue, tenable for the life of the grantee or in the discretion of the Local Administration for one further life, shall be bestowed or restored in the North-Western Frontier Province and in Beluchistan.

THE INDIAN PRINCES.

In his gracious solicitude for the welfare of His Royal Indian Princes, His Imperial Majesty has commanded me to proclaim that from henceforth no *Nazarana* payments shall be made upon succession to their States, and sundry debts owing to the Government by the non-jurisdictional estates in Kathiawar and Guzerat, and also by the Bhumia Chiefs of Mewar will be cancelled and remitted in the whole or in part, under the orders of the Government of India, and in appreciation of the Imperial Service Troops certain supernumerary appointments in the Order of British India will be made.

RELEASE OF PRISONERS.

In the exercise of his Royal and Imperial clemency and compassion, His Most Excellent Majesty has been graciously pleased to ordain that certain prisoners now suffering the penalty of the Law for crimes and misdemeanours shall be

released from imprisonment, that all those civil debtors now in prison whose debts may be small and due not to fraud but to real poverty, shall be discharged, and that their debts shall be paid.

The persons by whom and the terms and conditions on which these grants, concessions and benefactions shall be enjoyed will be hereafter declared.

After the tendering of the homage by the Ruling Chiefs His Majesty said —

We are pleased to announce to our people that on the advice of our Ministers tendered after consultation with our Governor General in Council we have decided upon the transfer of the seat of the Government of India from Calcutta to the ancient Capital of Delhi, and simultaneously, and as a consequence of that transfer, the creation at as early a date as possible of a Governorship for the Presidency of Bengal, of a new Lieutenant-Governorship in Council administering the areas of Behar, Chota Nagpur and Orissa, and of a Chief Commissionership of Assam, with such administrative changes and redistribution of boundaries as our Governor-General in Council, with the approval of our Secretary of State for India in Council, may in due course determine. It is our earnest desire that these changes may conduce to the better administration of India and the greater prosperity and happiness of our beloved people.

PRESENTATION OF ADDRESSES.

On the 13th, the Madras and the Delhi Municipal Council addresses were presented to His Majesty. In reply to the Madras Address His Majesty said:—

We are deeply moved by the loyal feelings which have inspired the inhabitants of the oldest Province in our Indian Dominions, numbering over forty million people, to unite in giving so cordial a demonstration of their attachment to our Throne and person. The great volume containing signatures representing all the different races, castes and creeds of Southern India will be ever treasured by us as a precious testimony of your loving welcome.

In replying to the Delhi Municipal Address he said:—

The traditions of your City invest it with a peculiar charm. The relics of the dynasties of bygone ages that meet the eye on every side, the splendid palaces and temples which have resisted the destroying hand of time, all these witness to a great and illustrious past.

In seeking a more central spot for the seat of the Government of India these traditions and characteristics conduce in no small degree to the decision which I have as recently announced, that from this time forth Delhi shall be the Capital of our Indian Empire.

On the 14th there was a grand military Review.

LAYING THE FOUNDATION STONE OF THE NEW CAPITAL.

On 15th December 1911, Their Imperial Majesties laid the first stones of the new Capital of India. The place selected was in the Government of India Camp, which had been decided to be the centre of the Imperial Delhi that is to be. The Heralds and the whole of the Local Government and Administrations were in attendance, also the Ruling Chiefs and the Coronation Durbar Heralds and Trumpeters, with a Guard of Honour and Escorts. Their Majesties, on arrival, were received by the Governor General and the Members of the Executive Council. A royal Salute was fired. The Governor General then made a short speech, and in the course of his reply His Majesty said:—

I earnestly hope that the anticipation of the beneficial and far-reaching results from the great changes now to be effected may be amply fulfilled, securing to India improved administration and to its people increased happiness and prosperity. It is my desire that the planning and designing of the public buildings to be erected will be considered with the greatest deliberation and care, so that the new creation may in every way be worthy of this ancient and beautiful city.

Their Majesties the King and Queen and Their Excellencies the Viceroy and Lady Hardinge left Delhi on the 16th, the King proceeding to Nepal, the Queen to Agra, and Their Excellencies to Barrackpore.

The departure of Their Majesties was marked by the same demonstration of enthusiasm as marked their arrival and all the functions connected with the Durbar.

THE RESULT OF THE DURBAR.

The great Durbar was a splendid success and as Mr. Harold Cox wrote, one is tempted to say, paradoxical though it may sound, that the great success that King George has achieved by coming to India is to demonstrate that in the East as well as in the West democracy and Royalty not only can be reconciled, but already are. King George and Queen Mary have succeeded in proving this because they have shown themselves to be not merely names but realities. They have shown

that they realise to the full the part which Kings and Queens, if they wish to do their duty, have to play in a democratic age. They have played their part splendidly throughout the whole of their stay in Delhi, and the whole Empire owes to them a debt of gratitude for the success they have achieved.

THE SHOOTING IN NEPAUL.

Particulars received of the King Emperor's shoot in Nepal state that the King's first shooting box was picturesquely situated on a lawn-like clearing sloping down to the river, and a splendid view was obtained of the long range of snow peaks of the Himalayas rising to a height of 24,000 or 25,000 ft. After shooting here for four days, the party moved on to Khasra, seven or eight miles away, where the scenery and the forest surroundings were even more beautiful.

His Imperial Majesty shot with wonderful accuracy, and 21 tigers and several rhino fell to his rifle. About 650 elephants were employed in the shoot.

AT CALCUTTA.

Their Majesties arrived at Calcutta on the 30th. His Imperial Majesty the King-Emperor, and Her Majesty Queen-Empress, were received by Their Excellencies the Governor General and Lady Hardinge.

The Calcutta Corporation presented an Address of Welcome and His Majesty in the course of his reply said :—

The changes in the administration of India resulting from the announcement made by me at the great Durbar at Delhi will affect to a certain extent Calcutta. But your city must always remain the premier city of India, its population, its importance as a commercial centre and great emporium of trade, its splendid historic traditions, all combine to invest Calcutta with a unique character, which should preserve to it a pre-eminence position. At the same time, the status of the Province of which Calcutta is the Capital has been enhanced by the creation of a Presidency of Bengal, and I feel confident that under the wise administration of a Governor-in-Council the new Presidency will enjoy increased prosperity with the blessings of tranquillity and order.

THE UNIVERSITY ADDRESS.

On the 6th, the Calcutta University presented an address to which His Majesty gracefully replied :—

It is to the Universities of India that I look to assist in that gradual union and fusion of the culture and aspirations of Europeans and Indians on which the future well-being of India so greatly depends. I have watched with sympathy the measures, that from time to time have been taken by the Universities of India to extend the scope and raise the standards of instruction. Much remains to be done. No University is nowadays complete unless it is equipped with teaching faculties in all the more important branches of the sciences and the arts and unless it is provided with ample opportunities for research.

You have to conserve the ancient learning and simultaneously to put forward Western science. You have also to build up character, without which learning is of little value. You say that you recognise your great responsibilities. I bid you Godspeed in the work that is before you. Let your ideals be high and your efforts to pursue them unceasing, and under Providence you will succeed.

Six years ago I sent from England to India a message of sympathy. To-day, in India I give to India the watchword of hope. On every side I trace the signs and stirrings of a new life. Education has given you hope, and through better and higher education you will build up higher and better hopes. The announcement was made at Delhi by my command that my Governor-General in Council will allot large sums for the expansion and improvement of education in India. It is my wish that there may be spread over the land a net-work of schools and Colleges from which will go forth loyal and manly and useful citizens, able to hold their own in industries and agriculture and all vocations in life, and it is my wish, too, that the homes of my Indian subjects may be brightened and their labour sweetened by the spread of knowledge, with all that follows in its train, a higher level of thought, of comfort and of health. It is through education that my wish will be fulfilled and the cause of education in India will ever be very close to my heart.

THEIR MAJESTIES' DEPARTURE.

Their Imperial Majesties left Calcutta on the 8th amidst universal rejoicing and respectful and sincere good wishes. Vast crowds assembled along the route from Government Place to Princeps Ghat. High officials took leave of Their Majesties at Government House and a gorgeous procession left under Royal Salute at 11. As the procession moved slowly along the Red Road and Ellenborough House, the King-Emperor and Queen-Empress were loudly cheered. Princeps Ghat was reached after 11-30, where the representatives of various Public Bodies, Ruling

Chiefs of Bengal and Foreign Consuls were assembled to greet them.

Their Imperial Majesties the King-Emperor and Queen-Empress embarked at *Prinsep's Ghat* for Howrah Station at 11.55 after a splendid send off. His Majesty replying to an Address at the Ghat from the Members of the Bengal Legislative Council said—

We shall recall the warm-hearted greeting extended to us on our arrival in your Capital, and the sight of the patient and sympathetic multitudes which had assembled from all parts of the province to testify to their loyalty and I am gratified by the assurances given in your Address that these outward proofs of allegiance and affection reflect the general sentiments of your fellow-subjects throughout the length of North-eastern India. Nor shall we forget the striking scenes and brilliant displays which have been so successfully organised and carried out to celebrate our visit. The people of Bengal offer us as a farewell gift their 'overflowing love and gratitude'. You may rest assured that the Queen-Empress and I could ask for nothing more precious to us and to our children.

The Governor General's Special arrived a little before 11.30 on the 10th at the Victoria Terminus, Bombay and His Excellency was received on the platform by H. E. Sir George Clarke and the high Government officials. Punctually at noon, Their Majesties' train steamed into the platform.

A procession, a mile long, immediately started and marched at a walk. The Escort comprised the 7th Dragoon Guards, the Bombay Light Horse, the Royal Horse Artillery and the Governor's Body Guards. The crowds cheered lustily all along the route.

THE LEGISLATIVE COUNCIL'S ADDRESS.

At 12.30 on the 10th, Their Majesties arrived at Bunder, where the Legislative Council's Address was presented.

His Majesty replying said:—

It is a matter of intense satisfaction to me to realise how all classes and creeds have joined together in the true-hearted welcome which has been so universally accorded to us. Is it not possible that the same unity and concord may for the future govern the daily relations of their private and public life? The attainment of this would indeed be to us a happy outcome of our visit to India. To you the representatives of Bombay, who have greeted us so warmly on our arrival and departure, I deliver this our message of loving farewell to the Indian Empire.

Their Imperial Majesties embarked at 1 P. M.

MESSAGE TO MR. ASQUITH.

On the eve of his departure from India His Majesty sent a message to Mr. Asquith on the success of his Indian Tour, in the course of which he said "from all sources, private and public, I gather that my highest hopes have been realised and that the success of our visit has exceeded all expectations." "All classes, races and creeds have united in receiving us with unmistakable signs of enthusiasm and affection."

MESSAGE TO THE VICE-ROY.

H. E. the Viceroy telegraphed to His Imperial Majesty the King-Emperor on the 13th instant:—

With humble duty, on leaving Indian waters all India wishes Your Imperial Majesties Godspeed on your journey and prays for your safe and happy arrival in England. Your Imperial Majesties' visit to India will always be treasured by your loyal Indian subjects as a priceless incident in the history of India.

His Imperial Majesty the King Emperor on the 14th instant replied as follows:—

Before leaving Indian waters the Queen and I desire again to acknowledge with sincere gratitude all that you have done for us during our most happy and never-to-be-forgotten stay in India, and at the same time to congratulate you heartily upon the admirable manner in which everything in connection with our visit was planned and carried out.

King George's Speeches on Indian Affairs.

PART I—A complete collection of all the speeches made by His Majesty during his tour in India as Prince of Wales.

CONTENTS.—Reply to Bombay Corporation, Speech at Prince of Wales' Museum, Speech at Alexandra Dock, Reply to Central India Chiefs, Indore, Reply to Udaipur Maharana, Reply to Jaipur address, Jaipur Banquet Speech, Reply to Bikaner Maharaja, Reply to Lahore Municipality, Reply to Peshawar address, Reply to Jammu Maharajah, Reply to Amritsar Municipality, Speech at Khelra College, Reply to Delhi Municipality, Reply to Agra Municipality, Unveiling Victoria Statue, Agra, Speech at the Gwalior New Market, Reply to Lucknow Municipality, Speech at Lucknow Medical College, Reply to Telukda's address, Reply to Calcutta Corporation, Speech at Calcutta Victoria Memorial, Reply to Rangoon Municipality, Opening of Rangoon Victoria Park, Reply to Mandalay Municipality, Reply to Madras Corporation, Reply to Madras Landholders, Speech, Victoria Technical Institute, Reply to Madras Citizen's address, Speech at Mysore Banquet, Speech at Chamarajendra Institute, Reply to Bangalore Municipality, Unveiling Bangalore Victoria Memorial, Speech at Hyderabad State Banquet, Reply to Benares Municipality, Reply to Quetta Municipality, Reply to Karachi Municipality, Unveiling Victoria Statue, Speech at Guildhall, London.

PART II—Full text of all the speeches delivered by His Majesty during his Coronation Durbar Tour in India.

Shells from the Sands of Time

OR

EARLY BRITISH TRADE WITH MADRAS, 1611-1711 & 1811.

By MR. D. E. WACHA.

O sovereign and his consort have hitherto been known in the annals of the world, ancient or modern, to have left their capital to visit their most glorious dominion, away six thousand miles and more by sea and land, to show themselves as crowned King-Emperor and Queen-Empress to their distant and alien subjects, numbering one-fifth of the human race, of divers creeds and nationalities, and inheriting the rich traditions of a memorable and immemorial civilisation, and evince in person their profound solicitude for their greater contentment, prosperity and progress. That auspicious visit was fully accomplished amidst regal pomp and pageantry by Their Gracious Majesties King George V. and Queen Mary of Great and Greater Britain. It has marked an unprecedented event which is destined to be inscribed on the page of History in letters as imperishable as illumining.

The history of the rise and progress of British dominion in India will no doubt be written in the fullness of time by another Gibbon, inimitable in style, of stately dignity and choice expression. Meanwhile, let us embrace the occasion to entertain the reader with scraps picked up from existing tomes to recall to memory the earliest beginnings of British trade with Madras. Let us recall how the Briton, with the blood of the Viking flowing in his vein, ventured from his seagirt isle to the famous East Indies, the land of pepper and spices, of cardamums and calicoes, thence to take back to his native shores argosies laden with those rich products. The tale has been thrice told, but it would bear repetition at this hour if only we stroll on the

glorious beach of Madras and pick up as we go shells from the sands which mark the times of trade of 1611, 1711 and 1811.

There sailed a vessel in 1610, equipped by the Honourable Company of British Merchants trading with the East, from the London docks, named the "Globe," commanded by Captain Hippon, with 2 merchants in search of an opening of trade on the Coromandal Coast for calicoes. After many a vicissitude on the voyage they came to Pittapole and traded leaving behind factors, the predecessors of our modern encyclopedic Civilian. They also traded at Masulipatam paying a customs duty of 4 per cent. though the rapacious Collector of King Narsinga had demanded 12! From Masulipatam to Siam and back again to Masulipatam was indeed a navigation feat in times which had not dreamt of steam vessels—those mighty revolutionaries of the nineteenth century which have so vastly changed the surface of the world and brought men of the Arctic to meet those of the Antarctic, to bring the Heathen Chinese cheek by jowl with the native of San Francisco and New Zealand.

The argosy which returned home in 1613, laden with the products of Coromandal realised 218 per cent. on an invested capital of £ 15,634! Those indeed were golden days to shake the Pagoda tree and become a rich Nabob in the ancient country beyond the dreams of avarice. The value of exports made by the Honourable Company in 10 years ending with 1611 was £ 51,673 in goods and £ 119,022 in bullion. Exports of bullion! That indeed is an indication of what a "Sink of Silver" was India as related by the great Pliny and the other early travellers from the distant West. This find of the trade shell on the Madras Beach is enough to record here for the year of Grace 1611.

We travel afield, planting our step slowly but steadily for a century. How did the British

trader fare in 1711?, that is, some fifty years or thereabouts after the Infanta dowered Charles II with Heptanesia or the island of Bombay, rich with the memories of Garcia de Orta and "My Lady of the Manor of Mazagaon." In the beginning of the eighteenth century Madras was pretty freely dotted with factories or *Kothies* whence has sprung up the magnificent British Indian Empire of to day. There were factories on the Coromandal Coast, in the city of Madras, Fort St. David, Cudalore, Porto Novo, Pattapole, Masulipatam, Madapollam, Vizagapatam, Bimp-liapatam and Ganjam. There were, of course, sub-factories subordinate to the principal factories. No less than 29 of these traded in pepper, then a most valuable commodity. But let us not forget to take special note of the first important Edict of Protective Tariff promulgated by the Ministers of the good Queen Anne. Printed calicoes, the speciality of Madras, was banned. The stuff had become of so universal a use as to cause a powerful agitation among the woollen and silk manufacturers of England. There were several riots in London. To redress the grievance of these protectionists, the earliest predecessors of the stalwart Tariff Reformers of the 20th century, it was enacted by Parliament in 1721 to preserve and encourage woollen and silk manufactures by absolutely prohibiting the wear of Indian calicoes under a penalty of £ 5 for each offence on the wearer and £ 20 on the seller! That indeed was the beginning of the end of the Indian trade with England in calicoes. The rest is history. But that is not enough. We have picked up another shell which needs to be enshrined in the Museum at Madras. In 1770 the penalty of 30 per cent. payable to the Merchants' Trading Company on goods imported from the East Indies under foreign commissions was found inadequate to shut out the trade. So a duty of 100 per cent. was levied on the value of all goods imported! Shades of Cobden and the Cobden Club! But

who is unaware that smuggling is synonymous with prohibitory tariff? The high duties on muslins and calicoes and nankeens operated as a premium on smuggling. At the close of the eighteenth century they were compelled to reduce the duties considerably. The century also witnessed more than one misfortune by way of heavy indebtedness of the Merchants Trading Company and measures had now and again to be adopted to liquidate the debt and start it afresh on its way to amass the wealth of the East Indies for the old country.

We now come nearer our own times, namely, the nineteenth century. Here are some more curiosity shells for our Madras economists. In 1802 the value of merchandise imported into Madras was 13 52 lakh Sicea rupees; and of treasure 5 71 lakhs. In 1805 the value of the imports of merchandise had reached 13 13 lakhs and treasure 8 83 lakhs. Exports came to 16 25 lakhs all in merchandise in 1802 and dwindled down to 4 50 lakhs in 1805. What may have been the principal commodities imported? The trade chronicle gives the reply for 1805:—

	Lakh Sicea Rupees
Wines and spirits	3 92
Miscellaneous	2 14
Glassware and looking glasses	0 80
Coral	0 64
Outlery and hardware	0 41
Orlman's stores	0 95
Metals	0 32

And what may be the principal commodities exported?

	Lakh Sicea Rs.
Price Goods	1 46
Precious stones	1 79
Cotton	0 38

It will be noticed from the above that the Briton could not manage without his beer, brandy and wine, and his sauce, salmon and salad oil. But it should not be imagined that they cared

only in the early part of the nineteenth century for the inner man. It was certainly not yet the age of printers and publishers and authors; neither of the half-penny dailies and peer journalists. Some books and pamphlets also came all the way from the old country to beguile the leisure hours of the money-making "factors." Here is an entertaining list of the pabulum imported for their mentality:—

- 2 Sets of Novelists Magazine.
- 2 " British Classics,
- 2 " British Poets.
- 2 " British Theatre.
- 2 do. Fielding's Works.
- 2 do. Smollett's "
- 2 do. Johnson's "
- 2 do. Blair's "
- 2 do. Elegant Extracts.
- 2 Sets Hume and Smollett's History.
- 2 " Shakespeare's Plays.
- 2 " Thomson's Seasons.
- 2 " Young's Night Thoughts.

But I at though not the least there were 200 copies of "Dycho's" New Spelling Book." For whose benefit were these 'spelling books? Not for the adult factors? In all probability they were for their children by European or Indian wives. May we appeal to some wanderer in book curiosity lore to tramp the public and private libraries of Madras to discover a copy of this remarkable spelling book. What an acquisition might it be to the Museum? Messrs. Natesan & Co., with their colossal enterprise, ought to be venturesome enough to unearth a copy from some remote corner to point a moral and adorn the intellectual tale of Madras in the year of Grace 1805.

Before however we bring to a close our stroll on the Madras beach in search of further curious shells of trade we may as well empty our modest wallet by way of "prices"—so much in vogue

by the Government of the day. What may be the prices in Madras in 1811 of the divers European produce, etc.?

Star Pagoda.

Coffee was sold at	.. 20	to 22	for a Candy.
Cotton from Bombay.	30	to 32	"
Pepper from Bengal..	40	to 41	"
Indigo ..	9	to 10	per maund.
Ivory from Pegu ..	140	to 220	per candy.
Gum Benjamin ..	95	to 100	"
Assofetida	from		
Basora ..	365	to 440	"
Gold from England..	6½	to 8	per 1011.
Silver ..	6	to 6½	"
Brandy from America	200	to 280	per butt.
Madeira ..	150	to 170	per pipe.
Copper Sheet ..	103	to 120	per candy.
Iron Hoops ..	27	to 29	"
Mexico Silver ..	½	to ¾	per oz.
Tin ..	70	to 85	per candy.
Sandal wood ..	30	to 85	"
Bengal Sugar ..	17	to 19	"

The list is not exhaustive and we omit to give the price of diamonds, pearls and rubies which are not exactly articles of trade.

The duty on articles imported in British bottoms was generally 6 per cent *ad valorem*.

Lastly, the Company's imports from Europe amounted in 1808-09 to £168,000, while the exports came to 64,48,000 rupees, which might be compared with the value of imports and exports in 1909-10 to have a clear conception of the strides of British trade with Madras during the nineteenth century. The subject of picking up at random these commercial shells from the sands is most fascinating, but we must stop here, feeling that we have provided enough entertainment which though not striking the imagination as the tales of the Thousand Nights is still sufficiently instructive of the evolution of British Commerce during two and a half centuries at the least. We have shown the way. Let others explore the Madras strand and garner old century treasures which may survive the tooth of Time.

Mr. A. O. Hume:

THE FATHER OF THE CONGRESS MOVEMENT.

BY MR. P. N. RAMAN PILLAI.
Editor of "The Weekly Chronicle."

Mr. Allan O. Hume was born eighty-three years ago. His father, Dr. Joseph Hume, was a member of the Indian Medical Service, who, after his return to his native land, entered the House of Commons. Joseph Hume was a sound Radical, a noted political reformer and economist, a power in the House of Commons. No budget, or estimates of expenditure, submitted to that House, escaped his scrutiny. His passion for public economy became almost a religion with him, and even Lord Palmerston's aggressive imperialism had to reckon with him. Mr. Justin McCarthy calls him the pioneer of financial reform. He was for retrenchment and economy all round. He had the courage to propose a substantial reduction of Prince Albert's annuity. His activities were not confined to the financial sphere. In 1835 he rendered a most signal service to the Empire, by discovering and exposing what was called the Orange Plot in which the Duke of Cumberland was suspected to be concerned and one of the objects of which was said to be to set aside the claims to the Throne, of Princess Victoria. In the exciting events which terminated in constituting Canada into a self-governing colony, his shrewdness and insight were peculiarly marked. During one of the Parliamentary debates on that subject Sir Robert Peel, rather thoughtlessly, referred to Mr. Mackenzie, the leader of the colonists in Upper Canada, as 'a Mr. Mackenzie.' Hume turned on Peel and remarked that "there was a Mr Mackenzie as there might be a Sir Robert Peel" and created some amusement, says a historian of the period, by his referring to the declarations of

Lord Chatham on the American Stamp Act, as the opinions of "a Mr. Pitt." He was throughout on the side of Lord Durham, that wise statesman who gave the right of self-government to Canada, in the latter's advocacy of the interests of the colony; and, so far as it affected that nobleman he dropped the question of economy. His position in Parliament about this period was similar to that held by such distinguished men as Grote, the historian of Greece, Bulwer, the novelist and statesman, and Charles Buller, the brilliant politician too soon gathered to his fathers. On his death in 1855 Lord Palmerston observed in the House of Commons: "It had been said of one eminent statesman (Burke) that he 'to party gave up what was meant for mankind,' whereas the very reverse might be said of Mr Hume, for the party to which he had devoted himself was his country, and, beyond his country, the general interests of mankind at large." Once a Congress deputation of which Mr A O Hume was a member, waited upon the late Mr. Gladstone, to enlist his support for the Indian Councils Bill about to be introduced into the House of Commons by the late Mr. Bradlaugh; and on Mr. Hume being introduced Mr Gladstone said: "I wish your father were here now." Mr. Gladstone knew Mr Hume's father personally and held him in high esteem. Joseph Hume's wrath was kindled to white heat at any tale of injustice, or when a farthing of the British taxpayer's money was wrongly or unprofitably spent. He was a selfless politician, whose philanthropic instinct was beyond cavil and beyond question, and the father's great qualities were reproduced in the son.

Following in the footsteps of his father Mr. A. O. Hume chose an Indian career. He came to India in 1849 and entered the Civil Service. As a young civilian he failed not to impress his personality on the people and on his superiors

But what a young civilian does in his narrow sphere is not often chronicled. Mr. Hume's work, however, drew the eyes of the higher authorities during the Sepoy Mutiny. He was then district officer of Etawah in the North-West Provinces. He so distinguished himself in that crisis that he was made a Commander of the Bath, a rare distinction for a district officer. The inhabitants of Etawah too were deeply grateful to him, and their appreciation of his services was given a concrete form in the institution known as Hume's High School.

Mr. Hume saw that as an agricultural country, India's interests required its great industry to be steadily developed. He had the knowledge of a scientist—he had indeed science in his blood, and he pursued the study of Indian agriculture with diligence and enthusiasm. He mastered the recognised treatises on the subject in German and English. He farmed, in a small experimental way, for his own information and amusement; and when in 1870 Lord Mayo established a Department of Agriculture, Revenue and Commerce, Mr. Hume was appointed Secretary. Lord Mayo was a great advocate of Indian agricultural reform, and he found in Mr. Hume an able coadjutor. Perhaps, not many know much of the work done by Mr. Hume as Secretary to the Government of India in the Department of Revenue, Agriculture and Commerce, as it was finally constituted. He composed and published a most instructive and interesting paper on "Agricultural Reform in India." In it he dealt with Indian agriculture from a variety of standpoints, both as an expert and as an administrator, such as the economic condition of India, the question of recurring famines, land tenure, departmental organisation, and the conditions and needs of Indian agriculture. Since Mr. Hume's time, other distinguished civilians like Sir Frederic Nicholson, have followed in the same track; and to-day the

claims of Indian agriculture are recognised. Among the pioneers of Indian agricultural reform Mr. Hume's name will always be coupled with that of Lord Mayo.

Mr. Hume had at the same time been surveying the general state of affairs in India. As an official he was able to appreciate the value of non-official co-operation. His own personal qualities won him the love and esteem of many an Indian. He liked Indians and Indians liked him, and between him and them friendly relationships were established. But it must have been clear to him that among Indians themselves there was not that active spirit of co-operation so essential to attain large public ends. He had occasion to exchange thoughts with several prominent Indians in different parts of the country, and the conviction that something must be done grew strong in his bosom.

Mr. Hume has well been described as the father of the Indian National Congress. The idea originated with him, and he carried it out. He looked after the infancy of the Congress with parental care—with more than parental anxiety. He nursed it amidst its depressing environments; and when he found that without his constant and zealous watchfulness it could exist and perform its vital functions, he retired to his island home, not indeed to rest from his labours, but, from that distance, to guide and correct, and infuse spirit into it as occasion demanded. He educated Indian Congressmen up to a proper realisation of their duties. He constituted the Congress itself on a broad and firm basis, with the forethought and wisdom of a great organiser; so that it now contains within it and forming part of it healthy and enduring elements of growth and development. If Indian leaders continue to be animated by his spirit and ideals and labour unselfishly on the lines laid down by him, the Congress will become a still more efficient and popular institution

embracing, in the future, the political activities of all the responsible sections of the people of India. Mr. Hume has not, even in his retirement, been a passive on-looker. He is virtually at the head of the Congress Committee in London and through it he keeps himself in touch with Congress organisations in India.

Perhaps, not all educated Indians fully realise the significance of his achievements. Mr. Hume has not been known as a political prophet or philosophical radical. Unlike his father he has taken no active part in the politics of his own country. He has been leading a retired life relieved, of course, by occasional excursions into the field of public controversy. But in the times to come when the names of some of those who now loom large in British politics will be buried in oblivion, his fame as an organiser and statesman will surely resound through the Empire.

He has followed in the track of Burke and Macaulay. Burke was the only champion of Indian interests when those interests were little understood by his countrymen. Industrious as he was, he had hardly any reliable and continuous channel of information and certainly no clear index to Indian opinion to guide him. By the sheer force of his unsurpassed genius he was able to get a firm grip of Indian affairs and give to his countrymen the fruits of his unaided labours. Macaulay was among those who received their illumination from Burke. Happily for India that great Englishman spent some of the most strenuous years of his early manhood in this country, and, by his work, broadened and deepened the foundations of British rule. Other British statesmen, like Bentinck and Ripon, imbued with the same spirit, laboured in India to the same purpose. In England Englishmen of the rank of Bright, Fawcett, and latterly, Bradlaugh, were equally strenuous in their endeavours on behalf of their Indian fellow-subjects. But not till Mr. Hume appeared on the

scene were the Government in India and the British public able to hear the voice of India itself, faint and faltering though it has been, amidst the dust and din of exciting polemics. He foresaw that Indian opinion to be of real help to the Government and to be effective in the management of its affairs, must be educated, organised, rendered responsible and brought into a single focus. No one holds that the Indian National Congress is a transparent mirror and faithful image of Indian opinion as the British House of Commons is of British public opinion. It is still young in years and but imperfectly developed. No institution, which has lived through only a quarter of a century, could be a perfected organisation, such as the British Parliament with centuries behind it, is. But that the Congress represents and reflects a most influential section of Indian opinion, not even the bitterest of its opponents can deny. At least it could claim to speak in the name and on behalf of a large majority of educated Indians.

It has done yet another great service. A number of Indian movements at this moment are honestly striving to improve its condition. Every considerable Indian community such as the Mahomedan, has its own organisation. Indians have been earnestly seeking to move onward in every direction. On the principle of division of labour or in the light of the insistent needs of each community we have political, educational, social, industrial and other movements in regard to one or the other of which almost every enlightened and energetic Indian has been active; so much so that India, which was for ages mute has become distinctly and in some cases even aggressively articulate. No one could now plead the absence of organised representation of interests as an excuse for action in a haphazard manner, or for inaction. On all sides and on every conceivable topic of the hour the Government are

pressed with advice. What exactly is the mind of the people amid the tremendous mass and contrarieties of opinion, none but those who possess the gift of clear vision could know. To distinguish the clamour of pragmatic busy bodies from responsible opinion has been the task in every country of statesmen and philosophers. So that Indian officialdom and Indian thinkers are not face to face with any startling or unusual phenomenon. There is, however, such a thing as evolution of opinion. Conflicts of ideals are a constant factor in every progressive community. As in the world of Nature, so here too, some of the opposing ideals will, after a time, survive the operation of the inevitable natural laws. Difficulty or danger lies where the people are altogether silent, immobile and inert, or where there is no organised opinion or concerted action. India was somewhat in this unenviable condition till Mr. Hume organised the Congress movement. He brought into being an institution or, a common platform from which every variety of enlightened Indian opinion and Indian thought could find expression. And the Congress became the parent, the prototype, the original, of every form of public activity in this country. There is hardly any great Indian movement which has not taken as its model, or has not imitated in several important particulars, the Indian National Congress. Some of these organisations disown the Congress, and a few are hostile to it. But the fact cannot be gainsaid that many of these have copied its methods, or are influenced by its example. Mr. Hume may therefore be said to be not merely the father of the Indian National Congress, but the passive and indirect originator of many an organised form of legitimate public activity in India.

If he so desired he could have risen to the position of ruler of an Indian Province. He preferred to be a reformer, and so soon as he got himself released from the trammels of office he

threw himself heart and soul into the work. The departure of Lord Ripon from India was the point at which he set about maturing his plans. Lord Ripon's policy and measures, no less than his inspiring example, filled him with hope and enthusiasm. Lord Ripon evoked that which was best in the Indian people; and Mr. Hume, like a born leader of men, availed himself of the opportunity to bring the energies and the enthusiasm roused under proper discipline and organised control. The idea dawned upon him of organised public effort; and how he worked it out and whose counsel he sought and followed may be given in the words of a distinguished Indian who, then and afterwards, enjoyed Mr. Hume's confidence in the fullest measure. In his Introduction to *Indian Politics* published in 1898, by Messrs Natesan and Co., the late Mr. W. C. Bonnerjee wrote as follows:—

It will probably be news to many that the Indian National Congress, as it was originally started and as it has since been carried on, is in reality the work of the Marquis of Dufferin and Ava when that nobleman was Governor-General of India. Mr. A. O. Hume, C.B., M.P., in 1881, conceived the idea that it would be of great advantage to the country if leading Indian politicians could be brought together once a year to discuss social matters and be upon friendly footing with one another. He did not desire that politics should form part of their discussion, for, there were recognised political bodies in Calcutta, Bombay, Madras and other parts of India, and he thought that these bodies might suffer in importance if when Indian politicians from different parts of the country came together, they discussed politics. His idea further was that the Governor of the Province where the politicians met should be asked to preside over them and that thereby greater cordiality should be established between the official classes and the non-official Indian politicians. Full of these ideas he saw the noble Marquis when he went to Simla early in 1885 after having in the December previous assumed the Viceroyalty of India. Lord Dufferin took great interest in the matter and after considering over it for some time he sent for Mr. Hume and told him that, in his opinion, Mr. Hume's project would not be of much use. He said there was no body of persons in this country who performed the functions which Her Majesty's Opposition did in England. The newspapers, even if they really represented the views of the people, were not reliable and as the English were necessarily ignorant of what was thought of them and their policy in native circles, it would be very desirable in the interests as well of the rulers as of the ruled that Indian politicians should meet yearly and point out to the Government in what respects the administration

was defective and how it could be improved; and he added that an assembly such as he proposed should not be presided over by the local Governor, for in his presence the people might not like to speak out their minds. Mr. Hume was convinced by Lord Dufferin's arguments, and when he placed the two schemes, his own and Lord Dufferin's, before leading politicians in Calcutta, Bombay, Madras and other parts of the country, the latter unanimously accepted Lord Dufferin's scheme and proceeded to give effect to it. Lord Dufferin had made it a condition with Mr. Hume that his name in connection with the scheme of the Congress should not be divulged so long as he remained in the country, and this condition was faithfully maintained and none but the men consulted by Mr. Hume knew anything about the matter.

Out of these informal confabulations was evolved the Indian National Congress. Lord Dufferin's suggestion was given effect to, as it was considered less encumbered with difficulties and more practical. But the main idea was Mr. Hume's. He had visions of a united Indian nation. He knew that it would be the result and product only of free and unrestrained intermingling of men otherwise isolated and exclusive in spirit and frequent discussing among them on a basis of equality on a common platform. Social fusion would contribute to political unity, or rather the discovery of a common basis of action would induce the inhabitants of the various Provinces of India to form themselves into a compact body for promoting common objects. - On Mr. Bonnerjee's own showing it is evident that Mr. Hume was actuated by a political idea. He desired, in the first place, to bring the officials and the representatives of the people, together for comparing notes and exchanging thoughts. He meant in this manner to popularise the Government and remove all causes of misunderstanding. He had also administrative efficiency as a goal to strive after. As one deeply versed in statecraft it was clear to him that to make Indian politicians more responsible and less visionary, they should be brought into living contact with the officers of Government, so that, in course of time, there might arise a body of well informed Indian public

men who might, like those who take part in Parliamentary discussions in Great Britain, learn the difficult art of self government and the secrets of the success of representative institutions. But Lord Dufferin took a different view; and Indians with whom Mr. Hume discussed the point accepted his Lordship's compromise.

The history of the Indian National Congress is too well known to be repeated here. From a small assemblage of a few distinguished Indians who met, for the first time, in Bombay, it developed into a vast organisation consisting of representatives of all Provinces and communities.

Its numbers so rapidly increased that from its own bulk it found it difficult to transact business when at Surat in the year 1907, and accordingly, it wisely and in good time got itself reformed and reconstituted in such a manner as to ensure its continued usefulness as a deliberative and responsible assembly.

But what we are here concerned with, is Mr. Hume's share in moulding it and shaping its policy. For nearly eight years from the start he directed it as its General Secretary, with a view, as he once said, to constituting it as "a great brotherhood," whence for India to rise to nobler things. "I live for India and India's people," were the words which he spoke at a great meeting got together to honour him. In an address presented to him by the Poona Sarvajani Sabha eighteen years ago, an address in the composition of which we see the Roman hand of the Hon'ble Mr. Gokhale, that body voiced the thoughts of all educated India when it referred to Mr. Hume's services in these terms:—

Your great administrative experience and your intimate knowledge of the people of this country, your high personal character, the singular devotion which you have shown to India's interests, and the unexampled sacrifices which you have made for her—all these have enshrined your name in the loving hearts of the people of this country as that of their first tribune and their saintly Gurus in the path of

MR. A. O. HUME.

Lieutenant-Governor of the North-West (now United) Provinces, openly assailed the Congress, subjected its objects and methods to "hostile criticism and otherwise sought to discredit it. There is nothing in modern Indian controversial literature more stimulating than the correspondence that passed between Sir Auckland Colvin and Mr. Hume in 1888. Mr. Hume's reply is an effective vindication of the Congress. It occupies forty-six printed pages of a closely printed pamphlet.

Dealing with the time at which the movement was inaugurated and the justification for it, Mr. Hume said: "The ferment, the products of Western ideas, education, inventions and appliances, was at work with a rapidly increasing intensity and it became of paramount importance to find for its products an overt and constitutional channel for discharge instead of leaving them to fester, as they had already commenced to do, beneath the surface. I have always admitted that in certain Provinces and from certain points of view the movement was premature, but from the most vital point of view, the future maintenance of the integrity of the British Empire, the real question when the Congress started was not, is it premature, but is it too late—will the country now accept it? That question, by God's blessing, the country has since answered in the affirmative; * * * A safety-valve for the escape of great and growing forces, generated by our own action, was urgently needed, and no more efficacious safety-valve than our Congress movement could possibly be devised." Mr. Hume then went on to classify and characterise the opponents of the Congress among English officials and non-official Indians and in the press. If, said he, there was any real and influential opposition of enlightened and cultured men in India, he would not have taken up the task. He said: "I am not playing at this matter. I am in deadly earnest; for it I have abandoned

all the scientific pursuits that made the pleasure of my life—to it I am devoting my whole time and fortune—to it I am almost giving my life, because I believe that on the successful evolution of the movement depends alike the happiness of millions on millions, and, in no small measure, the future progress and prosperity, not only of India, but also of the British Empire." Mr. Hume then discussed the practical character of the Congress programme. Nothing, he maintained, was included in it, which was not discussed between, or in the minds of, the best and wisest men among Indians and Anglo-Indians. The improvement of revenue and forest laws, reform of the police, the costly administration of justice, the necessity for reduction of expenditure and of taxation, larger employment of Indians in the public service, and other objects to which the Congress was devoting its labours were all enumerated and explained by him with a view to make its position clearer. He admitted that in these and other matters individual Englishmen had done much. "We have, many of us done our best," wrote he, "and if we have failed lamentably, and we have failed, in these matters, it has been due to no lack of good intention on the part of the best and noblest of our officials, but solely to the fact that aliens and foreigners, differing in manners, habits, methods of thought, traditions and all that makes up nationality, from the people over whom we rule, we are absolutely incompetent, without this full co-operation and guidance, to mould our administration and frame our institutions here in accordance with the real requirements of the country. This is one of the *raison d'être* of the Congress movement." This point was enlarged upon in the light of existing facts and in reference to various administrative acts and legislative enactments.

Sir Auckland Colvin, like some other Congress critics of the period, took objection to two pamphlets issued by two ardent adherents of the

him. But the letter we are considering was only one of his numerous public vindications of the Congress, at a time when, without them, this infant off-spring of his brain and energy would surely have been strangled to extinction by its powerful opponents. We wish that some of these productions found a place in the literature of the Congress published under its authority.

If Mr. Hume took upon himself the task of replying to the criticisms levelled at the Congress by eminent Anglo-Indian officials like Sir Auckland Colvin, he was not less active in inculcating upon Indians their own duties, in instilling into them the principles of constitutional agitation, in teaching them the amenities of debate, the value of forbearance and of courtesy to opponents. He preached to them on the virtues of union, of self-sacrifice and of respect for constituted authority. No deviation from the right path escaped his eagle eye, and no false modesty or delicacy stood in the way of his chastising any of his followers when they deserved it. Addressing a Bombay audience some eighteen or nineteen years ago he expressed himself dissatisfied with the ways of some of the supporters of the Congress movement. He indulged in a great deal of plain-speaking. He alluded to the want of reliability as a characteristic sin of the East, a sin from which the freer West was comparatively free. He continued:

"Here—and I speak from painful experience—men promise, promise, promise—no doubt in all good faith; but when the time comes for performance, how often do they allow any trifle to intervene to prevent their redeeming their word? It is a very serious matter, nationally it weakens you more than it is possible now to detail. You cannot rely on your fellows as a body. There are naturally bright exceptions, men whose words—as all Indian men's words should be—are as good as their bonds, but taking Indians in the gross, you cannot tell in the least whether, when the time comes, they will do what they promise. They often do not mean to deceive—nay, when they promise they mostly wish and intend, let us hope, to fulfil—but when the time comes the merest trifle suffices to prevent this. They have no adequate conception of the sanctity of the spoken word—no feeling that some what may, despite inconvenience, trouble, loss they must for their own honour's sake, if it be in any way possible, make good their pledged truth.

In England too, Mr. Hume admitted, the thing existed, but not to the same extent. Besides, in that country when a concrete case came up, his fellows made it hot for the guilty person whoever he might be. But what was the case in India?

But here they simply look down and say, "Well you know it is very bad; it really is too bad," and then a certain smile comes over their faces, and there is a side-look at each other which seems to say, "How could the fellow have been so green as to expect it?" This is an occasional experience in England, but it is chronic in India, and I tell you that unless you get rid of it you will never be a great nation, so make up your minds to it. I entreat all to set their faces against this kind of thing, be chary of promising, if you will, but having promised, perform punctually, despite all temptations to sneak out of the matter. Believe me this is not a little thing, but where national interests are concerned, one of the greatest moral reforms. Without it no powerful combination is possible, with it, strength can be united to strength, until the combination grows irresistible."

In another passage Mr. Hume impressed upon his hearers the value of self-denial. He tried to convey the great lesson of public discipline:

"Believe me, until the greater number of your workers are content to fight the battles of India solely for India's sake, careless who gets the credit, who reaps the fame, who wears the laurel, careless who is ranked first or last in the army of progress, by the world, but careful only that his country's cause prevails—there is little chance of that ultimate triumph, that glowing national renaissance, which we all so earnestly long for.

We have seen case after case of men leaving the side they believed in, deserting the cause which their own hearts pleaded for, joining the men they disagreed with, advocating the views they disbelieved, solely because they could thus acquire leading positions, which on their own side they would have had to work and wait for. To me nothing can be meaner or baser than this moral suicide. Here is a real devil, that tempts men to the sacrifice of conviction and principle on the unholy altar of personal aggrandizement and interest. And if ever any of you feel so tempted I pray that you may have strength to say boldly, "Get thee behind me Satan," and to remember that creatures of day, in this world of Maya (illusion), honour, and wealth, and credit amongst your fellows signify little, only this signifies greatly where your ever living ego is concerned, that you should be true to the light that is in you, and that you should set your heart only on the good and true, seeking mainly the welfare of mankind, and the development of your own higher nature."

In the same speech Mr. Hume went on to ask Indians to cultivate the virtue of patience. He certainly had no sympathy with the impatient idealists who want everything good to issue forth on the principle of "let there be light and there

when our dear and truest of friends, Sir W. Wedderburn, is to be with you, I am in no degree wanted so far as you and India's cause is concerned.

I wish you all possible success in this coming Congress, and this, I am sure, you will all do your best to ensure and to deserve.

And now, I should like to repeat for you, the message I sent to my old friend C. Vignaraghavachari of Salem, just two years ago.—

'If this should chance to be my last message and advice, I would say to you and to "all", be of good cheer! never grow faint or weary in the uphill fight, stick to constitutional methods, be united, brother soldiers in one holy army, put far from you alike all selfish aims, all personal differences, be vigilant, wise and temperate alike in worth and in desert, be sure that a Power greater than all Kings or Viceroy, or Parliaments will lead you in the fulness of time, to all that you can rightly and wisely desire, and to all that you have tutored yourselves to merit.'

I can add nothing to that. May God bless all your efforts to promote the welfare of your fellow-countrymen, and lead and strengthen all striving unselfishly to pave the way for India's enfranchisement, and the happiness and growth, physical, mental and moral of her teeming children.

The time has not come finally to compose Mr. Hume's epitaph. He is still the leader of the Congress. His name is a household word in India. Mr. Hume, Sir William Wedderburn and Mr. Dadabhai Naoroji are the three great pillars of the Congress. Nearly of the same age, they are the three venerated patriarchs of Indian Liberalism. You may look all the wide world over in vain for three musketeers, more revered, more beloved, more saintly in character, spotless in their lives and more unselfish in their passion for the welfare of nearly one-fifth of the entire human race. Never in recent Indian history has there been another great movement at the head of which stood such dauntless three. Even the tongue of calumny could invent nothing against them. Plain living and high thinking has been their creed. Mr. Hume, like his comrades, is, we believe, both a vegetarian and a teetotaler. He is a keen student of natural history; and when he is able to snatch a few moments from his active public work he would be found pursuing the study of his favourite subject. But his warm heart has always been in India, and Indians could not too deeply love him.

INDIANS IN SOUTH AFRICA.

BY

THE REV. THEOPHILUS SUBRAHMANYAM.

GOOD morning, Mr. Subrahmanyam. How are you? When did you come from South Africa?

Quite well, thank you. It is now five months since I arrived from Natal.

Would you kindly enlighten me on matters relating to Indians in South Africa? I am very anxious to know from you seeing that you are fresh from that anti-Indian land and that you have been a missionary to the Indians in that country.

Certainly, I shall tell you all I know from my own personal observation of things and from what I have heard on the spot.

How long were you in Natal? Fully three years.

Then you surely know more than what one can gather from books. Yes, I know something but cannot presume to know everything.

What made you to return so soon? Perhaps you are out on a short visit? Are you?

Nothing of the sort. I have returned for good and it has surprised many fellow-missionaries and ministers. I am myself distressed about it. It was my hope that I would stay in South Africa for a number of years as a Christian Missionary to our own countrymen, but could not do so.

Then there must be some special and grave reasons for your return. Was that so? Yes. I am painfully shocked to admit it.

Has the present situation in South Africa anything to do with your return for good?

Being an Indian myself how could it be otherwise?

What! As a Christian Missionary, had you to share in the common sufferings of Indians yonder? I should have thought differently. Perhaps, the Europeans in Natal and other parts of South Africa regard all Indians—whether they

be of any faith—alike without any mark of distinction.

Quite so. As long as a man is not a "white-man" his lot in that country under the existing condition of things is no better than that of an ordinary animal.

Are all Europeans like that?

Oh! no. It is not so. But those that regard Indians as human beings are few indeed.

Then, what about the white Missionaries and ministers? Do they differ from the common run of white people in their attitude towards the unfortunate Indians? There are very few European Missionaries engaged in work among the Indians, but those that are certainly differ from the other people. Perhaps it will be painful to know that those few also find it a task to recognise an Indian if they happen to be in the company of lay Europeans.

However, what are the disabilities of our Indians in that "wonderful" country? Are they many and so very serious as we often have heard and read?

Yes, I am sorry to say that they are many and very grievous. The various indignities and ill-treatment which the Indian community in Natal have been subject to for years cannot adequately be expressed in words. In the streets, in the tram cars, in the rickshaws, on the footpath, in the stores shops, post offices, banking places and in the trains and, I may boldly say, everywhere Indians may surely expect to be insulted. Further, all Indians from Mr. Gandhi, our great leader in South Africa, to a common labourer are contemptuously designated as "Coolies or Samys." In every business place in Natal "first come first served" is not the rule but the general rule as I found it was "Europeans first and the ill-favoured dark complexion next or not at all."

Public places of health-resorts, towards the making and support of which Indians also contribute, are denied to us. White people can roam

about at their will during nights but poor Indians, however respectable, will not be allowed without some pass. In the schools, both Government and aided, the unwritten rule is that no Indian language can be taught nor can the children speak their mother tongue within the school premises. Further, children above fourteen years of age cannot read in any recognised schools and consequently cannot hope to rise higher than the 4th standard.

On occasions of public festivity such as the opening of the New Town Hall towards the building of which a great deal of Indian labour and money was contributed, the visit of the H. R. Highness the Duke of Connaught and the King's Coronation, the unfortunate Indians were treated worse than brutes of Creation.

In the English churches the dark complexion is not recognised. The minister in charge may be willing to allow a non-European but the congregation will not stand it nor hear of it. Public hotels, Restaurants, Refreshment rooms on the Railway line and public baths within the Municipal limits are exclusively for the favoured Whites.

Our people not only suffer severe exclusion from the Parliamentary franchise rights, but they are deprived also of the Municipal vote once enjoyed by them. We cannot move from one Province to another without a special permit of some sort or other from the highest authority in the Union. Fresh trading licenses are not granted to Indians. In many cases serious difficulties are experienced in the matter of renewal of licenses. Transfer of license is a thing of the past.

Well, this state of things is simply shocking. Is it after all a Christian country? I doubt very much. What about the poor colonial-born Indians whose home is South Africa? How do they make their living. What avocations in life do they follow?

Colonial or no colonial, indentured or free, all

suffer just the same. There are a few doctors and lawyers among them, educated and trained in England; some work as clerks and interpreters under lawyers, a few are Government interpreters, but a good number of them are domestic servants. Solitary cases of them follow their father's calling which is no other than farming.

I understand that a large number of the working class of people who go out to Natal under indenture every year, is treated by the various employers very badly. Do they fare worse yonder at the hands of the Whites than at the hands of the caste masters in our own country? Further, I am led to believe from the recruiting agents as well as from the fact of so many among the returned coolies going back to Natal that they must be better off and better treated there. What do you say?

Recruiting agents' statements are in no way strange seeing that their bread would otherwise be at stake. The fact that so many among the returned coolies go back to Natal is due to social and moral difficulties on the one hand and poverty of the country on the other. If anybody knows anything of the exact condition of things relative to this particular class it is only such as are on the spot and directly engaged in some philanthropic work of some sort or other among them. And I as a Missionary to the Indians in that country know something which few can know. The lot of the majority of poor coolies in Natal is in my judgment one that very closely borders on the line of Egyptian slavery of old we read of in the Christian Scriptures. They suffer very much. Their wages are low. Their rations are scanty. Their habitations are not even fit for beasts of burden. Their hours of labour are practically long and the task masters exact more labour than the poor coolies' physical frame could stand. For little or no fault they are threatened with "Sjambok" i.e. a leather whip. For faults of serious nature no less than "cutting of an ear" or putting the party

in a ill-ventilated go-down without any food for day or two (very mild) threatening to shove (i.e. shoving the person for a while in an empty boiler of a sugar mill is the reward.

If at any time, the poor unfortunate beings not being able to bear the sufferings, make their way stealthily either to the Protector of Indian Immigrants or to the Magistrate close by they are in most cases sent back to the employer escorted by the orderly of the respective departments for running away from the employer without a pass which no employer would give to the coolies under the circumstances. Then follows a complaint from the employer to the Magistrate against the coolies for desertion resulting in a week's hard labour to the unfortunate and undefended coolies.

Then are they not better soon after the indenture ceases?

By no means. At least while under indenture the poor man or woman has the Protection of the law in his or her favour (though only in name.) But after becoming free from indenture the humble folks are penalised to pay a fine of £3 a head per annum for choosing to stay out in the land after giving the best part of their strength to it. The object of this inhuman tax was and still is to drive the folks out of the land or to force them to re-indenture again. On the top of this there is the poll tax for every man to pay from which, it is strongly believed, that all Europeans would be exempt from the following year. The only way in which the ex-indentured Indians can hope to get a living is by taking a piece of land from any European landowner on lease and cultivate it, but it again means an outlay of few pounds which no coolie can afford soon after the term of indenture service.

Then there is one more thing I should like to have some information on and hope you will kindly enlighten me. Now the Government of India has stopped all Indian labour for Natal and

in what way do you think that this action would alter the situation in Natal and also what are the leading and direct effects which will in consequence be produced.

I know for certain that this stoppage of Indian labour of Natal has already tended to make the situation somewhat better for the "Free Indian" labourers. They are offered fairly respectable wages. Even the re-indenturing coolies (who do so, much against our admonition) are given appreciable encouragement. Many intelligent coolies have been enabled to dictate to the various employers the terms of civil contract service but not indenture. This action of our benign Government has greatly gladdened the hearts of our colonial born Indians.

Another beneficial effect over which the long and sadly neglected natives of Natal rejoice more than any one else is the hopeful prospect of their being introduced in the various departments of labour of the country. And again White labourers are made bold to dictate their own conditions to the employers which they formerly hesitated very much to do for fear of the cheap Indian labour in the market. The "coloured" who are the living monuments of Western immorality or "white peril," as some call it, are being revived in their hopes of being engaged once again by Europeans in various capacities. Last of all but not least it has resulted in humbling the proud and wealthy owners of the different industries who are largely responsible for the untold miseries and sufferings of our poor countrymen in South Africa.

I am afraid I have already taken a good deal of your time but am anxious to know something of the Transvaal question and also of Mr. Gandhi about whom we read and hear so much. Do you know him? Have you ever met him?

Well, if you will kindly excuse me this time I shall, when we next meet, talk about Mr. Gandhi and the Transvaal question.

THE INDIAN INDUSTRIAL SITUATION.

BY

PROF. P. G. SHAH, M.A., B.S.C.
(*Forman Christian College, Lahore.*)

CHARACTER OF THE PEOPLE.

(1) Among the peculiarities which modify the economic and industrial condition of different countries, the most important place must be given to the inherent character of the people. The Hindus have been described from immemorial times as quiet, contented, skilful, thrifty and eminently religious or spiritual people. Such a spirit of religious contentment is not the result of an ignorant passiveness like that of the negro, but is enjoined by a peculiar view of the philosophy of life, interpreted in the light of religion which reaches even the illiterate through the medium of innumerable religious sects. The Hindu civilisation has been essentially spiritual, and as such non-industrial; to a similar extent, the Hindus have been found to be conservative and stationary by instinct; and so unable to keep up the same permanence of zeal and spirit which characterises the restless industrial activity of the Western nations. They believe in the futility of worldly possessions, perhaps, to a far greater extent than any nation in the world: and sometimes they are apt, under the influence of an absurdly pessimistic interpretation of the doctrine of Karma, to underrate the importance of personal effort.

SOCIAL INSTITUTIONS.

(a) *The inherited religious sentiments of the people have been fostered and their evil effects on the industries of the country, made more cogent by means of several social institutions and customs.*

(a) CASTE.

The most prominent of these is the system of castes and sub-castes, which has injured the Hindus in a variety of ways, specially in connection with their industrial progress.

em may have helped (as it did help) the progress of the nation during the earlier periods of civilisation, but its value in the economic life of the society at present is doubtful. At best, it may tend to the moral well being of the society, by keeping up a high standard of morality, by social dinners, and by serving as courts of arbitration; it may also ensure the preservation of hereditary skill and trade secrets. But these functions have disappeared, or have been distorted to such an extent that they serve, more or less, as economic hindrances. For example, it has hindered, till recently, the change of occupations to suit the industrial capacity of the individual or the needs of society. By lowering the workman's position and lowering the dignity of labour, it has checked the development of originality or invention, and of technical and artistic skill. By shutting the doors of the caste against the admission of new blood, and by "prohibiting" foreign travel, the people have been degenerated by internal strife instead of being benefited by contact with superior men. Irrespective of the evils due to the injustice* of the system, the very fact that Indian artisans and manufacturing classes have been always held in very low respect, being debarred from intercommunications and equalities with the trading and priestly classes, must have had injurious effects on the manufacture. The effect of the system is seen even now

in the absence of skilled artisans among the Hindus, the greatest portion of whom is employed in unskilled agricultural labour; while a great portion of the skilled labour is drawn entirely from the Mohammedans. Again the starting of new industries is restricted to a few Hindu castes, like the Banias of Bombay, Khatrias of the Punjab, Chetties of Madras and Marwaris in Bengal, whereas the exploitation of new markets, and the more risky forms of import and export trade are in the hands of Parsees, Mahomedans (especially the Khojas of Bombay,) who can travel over long distances without communal disabilities. On the whole, therefore the caste system has tended to the fossilisation of the ability of the people, by checking the growth of independence and adaptability.

(b) JOINT FAMILY.

Similarly the effect of the joint family system has been to discourage individual enterprise and so the desire for making money such as is felt in the West is scarcely felt by our workmen—whose sleek pockets are also subject to considerable amounts of social expenses—though it is likely to be a useful institution for production on a small scale, it is inconsistent with the modern ideas of individual development and domestic isolation.

CLIMATIC DIFFICULTIES.

(3) The climate of India, her vast fertile tracts of land, and her great mineral resources—have resulted in simplicity in the habits of dress and life of the people: and this simplicity has in turn reduced their wants. Though we are fortunate in having fertile land that gives the necessities of life at a small cost, our climatic difficulties are great. "The countries of the world most favoured by Nature, with regard to both national and international division of labour, are evidently those whose soil brings forth the most common necessities of life of the best quality and in the largest quantity, and whose climate is most con-

* But although the different professions were not formed into separate castes in the Puranic Age, yet . . . the different professions and trades came to be looked upon with disfavour. The caste system which unduly exalted the powers and privileges of priests had the inevitable result of degrading all honest trades and industries other than that of the priests. We noted this in the pages of Manu himself; we note this still more prominently in the pages of Vajouvalky. In a passage which we have referred to before, he condemns a large class of professions as impure and classes Physicians, Goldsmiths, Blacksmiths, Weavers, Dyers, Armourers, and oil manufacturers with thieves and prostitutes. Thus the Caste System in its later phase has served a twofold object. It has served to divide the nation and create actual ill-feeling. And it has served to degrade the men in order to exalt the priests.—B. C. Dutt, "A history of Civilisation in Ancient India" Vol. II, p. 218.

ducive to bodily and mental exertion." (List, "System of National Political Economy", p. 131). Thus while the bracing climate of England forces the people to work hard for gaining their livelihood, the luxuriant and enervating tropical climate here has made the people less inclined for work. India is a vast continent and the variety of climate obtainable in different parts is very great; though this gives splendid chances for variety of employment to both capital and labour, and offers an unlimited field for the development of agricultural and manufacturing industries, generally it does not permit of strenuous work. The enervating effects of the climate have been observed in the case of the those of sturdy races also, like the Moghuls, and the Afghans, who had lived permanently in India. The difficulties of the climate make it impossible to exact steady work in large factories which are so necessary at present. Thus, the climatic conditions have kept the standard of comfort low, and have sapped the energy of the people.

LAND.

(4) Condition of land in India has peculiarities of its own apart from the systems of tenure. The fertility of the land, and the variety of its produce have attracted many races of adventurers from the time of Alexander the Great. At present, however, much of the fertility is lost and the soil is exhausted by centuries of continuous cropping without proper manure. The chronic poverty of the Indian farmer has prevented him from using the best manures and the most efficient methods of production: and he is prone, by his conservative and contented instincts, to continue working along the old groove; he is "ground down between a rack-renting landlord and a usurious moneylender.*" Again the fertility of land here does not depend as in the Western countries on man's labour, but changes with the

changing conditions of rainfall, heat, cold, epidemics, insect-pests, &c. The scientific methods of facing these evils are yet to be cultivated and popularised. In spite of these difficulties it remains true that as much as 75 per cent. of the total population of India is supported directly or indirectly by land. This shows the vast agricultural resources of the soil though it is impoverished already.

However, the mineral resources of the country can scarcely be said to be utilised, much less, exhausted. In the opinion of Dr. Ball, (to be found in his "Economic Geology of India" p. 3) India's mineral wealth is unbounded, she can supply all the mineral requirements of the mineral work of a highly civilised community.

But it should be noted that the agricultural and mineral resources cannot be fully utilised in the absence of proper and cheap modes of communication and transport. Cheap transport is an essential condition in the industrial progress of a country. In the words of Professor Marshall "the dominant economic fact of our own age is the development not of the manufacturing but of the transport industries." India is singularly deficient in the means of transport. The vast area of nearly 17 million square miles cannot boast of more than five harbours—(Calcutta, Rangoon, Karachi, Bombay and Madras)—fit for international transport and out of these the first three require a costly system of dredging the sand deposits brought by the rivers. The cheapest source of inland transport, by means of navigable canals is lacking—only a few hundred miles are covered by the canals in Bengal and Madras. The Industrial prosperity of England owes a great deal to the cheapness and efficiency of her river canals and railways. India is deficient in both of these; and though the cost of construction of railway in India is lower than in other countries, the railway freights are so heavy as to injure the new industries.

* Morison "Industrial Organisation of an Indian Province" 1906, p. 8.

We have to note, however, in this connection that during the great part of the century under review, the railways were not existing. The only available means of transport was by means of caravans along certain roads, which again were unsafe owing to the ravages of robbers like the Pindaris and the Thugs. Again trade used to be at a standstill in the monsoons or during periods of warfare.

LABOUR.

(5) *Labour in India is considered to be very cheap: and this is one of the causes which have attracted foreign capital to India.* However a little familiarity with the nature and efficiency of the Indian labourer shows that the above idea is illusory. India is a land of agriculture and agricultural labourers may be said to be fairly efficient, specially looking to their education and social position. But they are unable to understand and realise the importance of the use of machinery in modern methods of production. They are ignorant, and, to a certain extent, unwilling to work* for long periods at a stretch; moreover they lack in the intelligence, and the general familiarity with use of machinery which is prominently seen in the West. Consequently, though the nominal wages to be paid to the Indian labourer per day are smaller than in many European countries, he is on the whole more costly to the employer. Thus a weaver in Lancashire can do the work of at least six Indian powerloom weavers and nine handloom weavers, and a labourer in coal mines of Europe does the work of 3 to 5 Indian colliers. Beside being ignorant and inefficient, our labourers are characterised by an immobility and conservatism

scarcely seen elsewhere. They are generally, unenterprising, and contented with their present lot; and being hampered by social and semi-religious customs, evince little desire for accumulation of money, and feel no pride or ambition for excelling in their work. The same might be said for the more skilled forms of labour required in the management of modern industries. The number of these skilled labourers or artisans is very limited and scarcely meets the growing industrial needs of the country; and many of these for want of a suitable and strictly reliable for the efficiency of management and production. There is a general consensus of opinion that these workmen are honest as far as purely pecuniary matters are concerned but they seldom possess the sense of steadiness and thoroughness in work—they show a tendency to avoid work or to do it haphazard, and, in general, a desire to escape the discipline and regularity, which are essential to the success of modern industrial organisation. Similar is also the tendency of our businessmen or capitalists except a few brilliant exceptions met with here and there, our capitalists exhibit little originality in their business methods; they lack in industrial training necessary for the modern methods of manufacture and trade; they are generally too shy to embark upon new enterprises and are willing to work along tried and beaten paths even at less profit. They control large amounts of capital and labour, but they cannot utilise these agents of production to their maximum advantage. Whatever may this inefficiency of our labour, skilled and unskilled, be due to, it is certain that only proper systems of elementary education for the labourers, and of technical and industrial training for the other classes can remedy the evil which hinders our industrial regeneration.

CAPITAL

(6) The amount of capital available in India is comparatively small. This can be seen in a variety of ways. The chronic poverty of the people

* The inefficiency of Indian labour is thus described in the Report of Factory Commission 1904, p. 20:—

"Meals are generally eaten during the working hours of the Factory. The midday interval is sometimes devoted to sleep, and the operative leaves his work frequently throughout the day in order to eat, smoke, bathe and so on. In the Cotton Textile Mills in India the average operative probably spends from 1½ to 2 hours each day, in addition to the statutory midday interval, away from his work."

is an admitted fact, though according to some it may be due to the fully justified "Home charges" sent to England, or to the "Economic Drain" in the excess of exports exceeding the imports, or according to some others it may be the result of the economic peculiarities of the country. The official estimates of the average income of an Englishman and of an Indian amount respectively to £42, and £2: while the income per head, as described by Sir Theodore Morison, are calculated to £42.7 and £2.5 respectively. Though these estimates are the result of the manipulation of "conjectural statistics", they are of more or less comparative value in showing the proportions of earnings, and also of accumulated savings in the two countries. A man earning £2 can save far less than what another, earning twenty times as much, can do: and capital is nothing but accumulated saving. This is also seen in the high rate of interest prevalent in India, viz., 4 to 9 per cent. as compared with that in England, viz., 2 to 2½ per cent. This high rate has attracted a vast amount of foreign capital into India; thus the proportion* of Indian to foreign capital working in India is roughly speaking 1:3. The low proportion of the Indian capital may be due to its being hoarded or squandered in non-industrial ways, or to its being too "shy" or to the failure of many of our joint stock companies or to a variety of other causes: but it has surely affected the rate of growth of our industries.

VILLAGE SYSTEM.

(7) The vast population of India is supported mainly by agriculture and a large portion of the

* "The statistics of British India for 1909-10," show the paid up capital of joint stock companies registered and working in India at 61.18 crores of Rupees, while the capital of joint stock companies registered elsewhere and working in India is 112.8 millions of sterling (pp. 49 and 81).

† The total number of joint stock companies started after 1882, amounts to 6140: of these only 2162 were working at the end of 1909-10 so that about 60 per cent of the companies started have been failures (*ibid* p. 47).

people pass their life in the villages without having ever visited any of the larger towns. This is possible on account of the exclusively self-sufficient nature of the village life. "A peculiar feature of Indian rural life is the way in which each village is provided with a complete equipment of artisans and menials, so that until the recent introduction of Western commodities, such as machine made cloth, kerosine, umbrellas, and the like, it was almost wholly self-supporting and independent"—(1901 Census Report, quoted in Economic Transition in India by Morison p. 9.) This has minimised the necessity of large towns as industrial centres. In India 90.1 per cent. of the people live in villages, and only 9.9 per cent. in towns (*ibid* p. 8.); in England 77 per cent. of the population dwell in towns or urban districts and only 23 per cent. in rural surroundings. The peculiarities of the Indian village life have hindered economic growth in various ways. The villagers lead isolated lives, and are extremely conservative to new ideas: they lack in ambitious enterprise and their economic life is governed rather by custom than by competition. The wages of the different artisans or the "officers" of the village* are fixed by custom. Sometimes competition may affect prices, rent, and wages in a limited area, but that is of a very crude type, as it exists between persons ignorant of market beyond the limited horizon of the village. These influences make the people homestaying and immobile: they give few chances for division of labour, and thus cause a waste of intelligence and skill. The system, by its social relations, checks emigration of the more intelligent to the towns. "In short the village system compels production on a small scale, deepens the effect of custom, checks individual ambition and initiative, and

* For an interesting description of Indian Village life, reference may be made to "Life and Labour in India" by Yusuf Ali or "Industrial Organisation of an Indian Province" by Morison Ch. II.

offers resistance to the wave of progress or of any vast economic change."

SMALL INDUSTRIES.

(8) Connected with the village system, is the dominant fact that India has been a country of small industries. Like the village, these industries have been of an exclusive character, a family being the unit of production of an article in all respects. There has been little scope for division of labour nor any for the co-operation between intellectual and manual departments of work in fact, specialisation has not been valued or practised. The Indian artisan works as capitalist and labourer combined: his own slender means supply the capital, while he and his family supply the labour: he works at his own cost and risk and for his own profits. He may be compared to the *entrepreneur* class—of course, of the most undeveloped type. This system may combine, to a certain extent at least, the advantages of a small scale production, viz., saving in superintendence, development of the independence of the workman, economy in labour by the utilisation of the non industrial labour of the members of the family as industrial labour, but in the absence of sufficient capital it is likely to prove injurious. The absence of systematic co-operation of the capital and technical skill is likely to upset the whole industrial machinery under the least shock from outside. This shock was received in the importation of cheap machine made articles, which changed the tastes and the wants of the people so rapidly, that our artisans were unable to stand against the inflowing tide. Illiterate and so unable to improve their lot in their trades, unassisted by any funds to fall back upon, left without any resources for bettering their position, our artisans had soon to leave off their old craft and to take to agriculture. This might explain how as large a proportion as 73 per cent. of the

total population in India have taken to agriculture. However, the small scale industries do not necessarily form an economic loss to the country; what we want is a healthy co-operation of the capital and labour on a small scale: on the other hand, the development of Indian Industries on the Workshop system will be more welcome (if accompanied by efficiency in production) as it will save the troubles of overcrowding, overwork, and underpayment as felt in other Western countries.

CONTACT WITH BRITAIN.

(9) Among the influences that have modified the industrial progress of India during the last century, the fact that she had come into a very close contact with a superior nation needs to be mentioned. Towards the end of the 18th century, India was a flourishing manufacturing country: the battle of Plassey in 1757, put her in the hands of the East India Company which had the interests of its shareholders nearer to its heart than those of the Indian people. At that time, the commercial policy of England was to limit the colonies to the production of raw materials useful to English manufacturers, and to reserve the colonial market exclusively for the sale of English manufactured products. This was also followed in the case of India, and was successfully carried out by the merchant-administrators under whom she was placed. It was the policy of the directors of the Company to foster the cultivation and export of raw produce and to suppress the Indian manufactures, either indirectly by taxing heavily and even prohibiting their importation into England or directly by harassing the artisans. Further, with the rise of British power in various parts of India, the native courts gradually dwindled and so could not support the artisans who have always clustered round them in large numbers. Apart from its administrative and political aspects (with which we are not concerned here), the struggle was unequal; the English nation was fast advancing in

* "Economics of British India" by Jadunath Sircar p. 46.

manufacturing industries, and her progress was helped by improved scientific methods of production and by a considerate system of protective tariff, whereas the Indian manufacturers, buried in ignorance, were too conservative and contented to make a stand worth the name, and were unable to retaliate, even if they dreamt of it. Whatever may have been the evils associated with this union specially during the 18th and beginning of 19th centuries, it should be noted that much of the industrial progress achieved during the last fifty years would have been impossible in its absence. It is sufficient to point out that the most essential conditions of industrial evolution, viz., internal peace, security of life and property, easy and safe methods of transport and communication, and mutual trust and confidence, were absent till the British established their suzerainty in India. A still greater advantage than the above is the practical industrial education of the Indians at the hands of an enlightened and advanced nation who have developed her resources with the help of their own capital and skill. There might be some disadvantages of the employment of foreign labour and skill, but it cannot be denied for a moment that the union of England and India has resulted in the utilisation of the latent resources of the latter and, in general, may be said to have thrown open vast opportunities for the earnings of land, labour, and capital in India.

SUDDENNESS OF THE TRANSITION.

(10) In the above connection it should also be noted that the economic transition in India is rather sudden and abnormal in certain respects. The quiet economic atmosphere to which the people of India had been accustomed for centuries has been disturbed by the pulsating wave of Western Industrialism. It would be perhaps too much to attempt to summarise the process of the transition (which is described in details in this book), but it might be pointed out that it is not entirely natural, in the sense of evolution from

within, but has been the inevitable result of the contact with a rapidly advancing nation. English education, British industrial enterprise, and British administration may be said, among other things, to have brought out the present industrial activity of the people. This however is not seen among all the people but is restricted to a small portion only of the literate classes which form only one-tenth of the whole, while a great portion of the people are yet practising primitive methods of agriculture. Again, the abnormality of the transition is seen in the unequal character of the development of our industries. Though the various factories of India are using large amounts of machinery, she cannot manufacture steel or iron, much less the necessary machinery. Thus the undeveloped condition of our metallurgical industries, the use of foreign capital in many of our business concerns, the chronic poverty and indebtedness of our farmers point out that the transition is not evolved from within. It is too rapid, and to a certain extent, revolutionary rather than evolutionary. The great Industrial Revolution in England was the result of agencies that worked slowly through centuries of steady growth. The inventions of Hargreaves, Arkwright, Crompton and Cartwright in Cotton spinning and weaving machinery, the invention of the Steam Engine by Watt, its utilisation in coalmining, railroad locomotion, and iron industry led to gradual concentration of industry in large factories. This was achieved in about one century, and though the time was not very long, it was a revolution from within and had a corresponding relation with the growth of the national mind. But in India we find the factory system established very rapidly and the Western methods and appliances "dumped," so to say, on the people who do not secure the corresponding educational and mental benefits. There is a wide gulf between the conservative methods of the people and modern methods of industrial

organisation, and if the people are not able to cope with the increasing demands of the latter, it is due to the fact that the transition is rather sudden and unaccompanied by a corresponding growth of the national mind along these lines.

DISABILITIES OF INDIAN CAPITALISTS

(11) Above all, Indian manufactures labour under some specific disadvantages, which have prevented the Indian capitalist from embarking on new enterprises. Probably he is too shy to enter into new industries and prefers to go along beaten tracks for example, recently the profits of cotton mill industry being very enticing a large number of cotton mills had sprung up suddenly, causing overproduction, insufficiency of trained labour, and failure of some mills. Moreover, the cost of setting up and repairing machinery in India is immense labour is inefficient, if not dear, and business capacity is very limited. Our manufacturers lack in the foresight and broadness of outlook their horizon is limited by the local markets, and even when they manufacture for distant markets they are too sluggish to respond to changes in demand and fashion. The failure of 60 per cent. of joint stock companies during the last 25 years shows that more technical knowledge, more business honesty and uprightness are needed. The so-called artistic wares of India lack in finish, neatness, and uniformity of design or quality this might be due to degeneration of the artisans for want of education &c., or of their tastes by the admixture of European fashions and fancies. The manufacture of many articles e.g. glass, paper, porcelain, soap, candle, inks, &c., which India can produce at least for local consumption, has been prevented by want of technical knowledge, smallness of demand, high railway freights, and the difficulty in general, of combining the production on small scale with the highest degree of skill, efficiency and economy. Even if production on a small scale were a success the local market may be lost

by a slight reduction in demand, or in market price by the European competitor (who is always anxious not to lose ground in India or in the foreign market) this would involve loss not of profits only but of capital also: thus the industry is nipped in the bud by foreign competition. The difficulties arising from abnormalities of railway freights* need a separate study but it may be pointed out that these are high when compared to the cost of erection and maintenance of railways in India, and also when compared to similar rates prevailing at present in European and American countries. Again, the difficulties of the manufacturing industries are enhanced by the fact that in many cases the freight for imported goods from seaport to an inland station is less than that from that station to the seaport. In short, it should be noted that the growth of Indian manufactures has been hampered by the influences indicated above.

* "The worst and most inexcusable feature of the Indian Railways Policy is the supreme indifference and neglect to the crying wants and wishes of the public."—Mr. Dinshaw Edulji Wacha. "The Railway authorities have been allowed to manipulate the trade of India very injuriously to the interests of the continent. Owing to the numerous demands on their time and thought the Government (both Supreme and Provincial) have never realised the mischief or they would have checked it. Generally speaking the tendency has been to encourage the import trade and to depress the local enterprise and industry."—Sir F. S. P. Lall. Both quoted by Mr. R. D. Mehta in "Commerce" dated 20th December 1911.

CORONATION IN ANCIENT PERSIA.

BY

SHAMS-UL-ULMA JIVANJI J. MODI.

 E get some idea of the coronation of the ancient kings of Persia from two principal sources :—

I. The Ancient Iranian sculptures.*

II. Two Iranian books.

(a) The Shah-nameh of Firdousi.

(b) The Letter of Dastur Tansar or Taosar to Jasnef-shah, the king of Tabristan.

As to the first, we find the coronation scenes in the following sculptures :—

1. Naksh-i-Rustam.

2. Two sculptures at Naksh-i-Rajab.

3. The City of Shapur.

4. Firouzabad.

(1) Naksh-i-Rustam.

The most important coronation scene among the sculptures of ancient Iran is that of the coronation of King Ardeshir Babagan, the founder of the Sassanian Empire of Persia, who came to throne after overthrowing King Ardvan, the last of the Parthian Kings of Persia. We find that scene in the sculptures of Naksh-i-Rustam. The inscription† clearly shows that the person on the left hand side is Ardeshir (Babagan). He bears an orb over his head, which is a symbol of sovereignty as in the British coronation ceremony. Behind the King, stands a servant. The person opposite the King gives him a *chakra* (wheel) with his right hand. The second figure bears an

inscription, which, as said above, says that that is the "image of the person of Ahuramazda, God." Mr. Edward Thomas and other Orientalists say that this is an image of Ahuramazda, or God himself and that it is God who is represented as giving to Ardeshir the wheel of sovereignty. I think that what is meant by the words "the person of Ormazd, God" is Mobad or the head priest. Nowadays also we at times hear or read of a bishop or a priest specially spoken of, as a "Servant of God." So the image is that of the Arch-priest of Persia, who crowns his king and not that of God himself. We learn from Herodotus that the ancient Persians did not erect statues or images of God. He says "They charge those with folly who do so, because as I conjecture, they do not think the gods have human forms, as the Greeks do."* So, it is clear that the image is that of the Mobadan Mobad or chief priest of the realm who invests the king with sovereignty. There is a similar sculpture in the city of Shapur wherein we find a coronation scene of King Nersay. Flandin says of it, that the second personage is the high-priest.

Let us proceed further in examining the coronation scene of Ardeshir. We find that under the feet of the horse of the second personage—the priest, there lies a person fallen prostrate over the ground, with his head turned towards the ground. Two snakes issue from his head. A snake symbolizes, according to the Avesta, Ahriman or the Evil Spirit. The evil-minded Azi-Dahaka or Zohak is represented in Iranian books, as bearing two snakes over his shoulders. So, the scene symbolizes that the Archbishop of Persia, asks the king at his coronation ceremony, to crush the power of evil. Compare with this the ceremony of presenting the Sword of Justice to the king in the British coronation ceremony. The Archbishop

* For the coronation scenes in these Sculptures vide (a) "Voyage en Perse" par M^{rs}. Eugene Flandin et Pascal Coste. (b) The Ancient Persian Sculptures by Mr. K. D. Kiash. (c) Kar Porter's Travels in Persia.

† "Early Sassanian Inscriptions, Seals and Coins" by Edward Thomas (1863) p. 29. Vide Memoires Sur la Perse, par Silvestre de Sacy (1793) p. 62 (Inscription B No. 3).

* Herodotus, Bk. I. 131.

herein exhorts the king to "reform what is amiss."

In the Iranian Sculpture there is also the image of a person lying under the feet of the horse of the king. That person bears a crown. He seems to be the image of the last Parthian king, Ardvan, whom Ardeshir at first overthrow and then assumed the kingship of Iran.

The Arch priest bears in his hand a stick. It is the wand which signifies authority. We see a similar wand of authority in the picture of Zoroaster, the prophet.

The king, while receiving from the Archbishop the chakra or wheel as a symbol of authority or kingship with his right hand, holds his left hand before his mouth. Mr. Flandin takes that to be a symbol of making a kingly promise or taking the coronation oath. *It seems to be a symbol expressive of some serious undertaking.* A modern Parsee priest also, in some of his important prayers, covers his left hand with a piece of cloth, more generally with a part of the long left hand sleeve of his Jameh, which forms his full ceremonial dress and holds that hand before his mouth.

The chakra (wheel) referred to above as a symbol of authority is the Avesta Chakra referred to in the Farvardin Yasht.⁷ There Zoroaster is spoken of as "the first of the Athravans (priests), the first of the warriors, the first of the agriculturists who spread prosperity, who first turned away the wheel (chakra) from the demons and from people of their stamp (*i.e.*, who deprived the evil minded of authority)". We find that in Buddhism also the chakra 卐 is held as symbol of religious law or authority.

In the Christian coronation ceremony, the ring, which resembles a wheel on a small scale, replaces the chakra. Compare the double Iranian

signification of the king receiving the symbol of authority with one hand and holding his other hand before his mouth as a symbol of making a serious promise with the following words of a Christian Archbishop spoken at the time of delivering the ring to the king:—

"Receive this ring, the ensign of kingly dignity and of the defence of the Catholic faith. And as you are this day solemnly invested in the Government of this earthly kingdom, so may you be sealed with that spirit of promise which is the earnest of the heavenly inheritance."

A ring plays an important part in Zoroastrian ritual also, but it is not referred to in connection with any coronation ceremony. It is used in the liturgical ceremony of the Yasna in its preliminary part known as the Paragna. There, it is known as the "Varac ni viti" *i.e.*, the ringed hair, because the hair of a white bull are entwined round it.

The presentation of a circular chakra or wheel to the king, and the idea of his taking some solemn oath holding it in his hand, remind us, as Mr. Flandin points out, of a custom among the modern Zoroastrians of Persia. When they take an oath in commercial or other affairs, they take a piece of thread or a part of the cloth of their turban and make a circle with it, and then holding the so formed circle in their hand they take the oath.

2. Naksh i-Rajab.

The first coronation scene in the sculptures of Naksh i-Rajab resembles that at Naksh i-Rustam to a great extent, especially in the matter of the important personages. This also is a coronation scene of King Ardeshir Babagan. It differs from the first in two respects.

(a) The chief personages are on foot and not on horse as in the case of the sculptures at Naksh-i-Rustam.

(b) Besides the two principal persons, the King and the Archbishop, there are six other

⁷ Vide the article on "The Coronation Service" by the Bishop of Madras, in the "Indian Review" of November and December 1911, p. 831.

⁸ Yasht XIII 89.

persons two of which are women and two children. These may be the queens and children of Ardeshir Babegan.

The second coronation scene in the sculpture at Naksh-i-Rustam differs from the previous one, in this that it is not the Arch-priest who gives to the new King the wheel of sovereignty, but another King. It seems to represent Ardeshir Babegan giving his crown to his son Shapur. We know that Ardeshir had given his kingdom to his son in his lifetime.

3. Shapur.

The next sculpture in our list is that at the city of Shapur about three days' journey from Shiraz. It represents the coronation of King Narsi. It resembles the sculpture at Naksh-i-Rustam.

4. Firouzabad.

The last of the coronation sculpture is that at Firouzabad. It differs from the preceding, in this that it represents three noblemen standing behind the King. They point with their fingers towards the heaven. This indicates that they hold heaven as witness to the fact of the coronation.

II.

Coming to books we will at first speak of Firdousi's account.

(a) He thus speaks of the coronation of King Behram Gour. It runs thus:—

"This was the custom of the exalted kings:—

When a new king of noble family comes to the throne, the Mobadi-Mobadan (the Arch-priest) goes before him, taking with him three intelligent wise men. He enthrones the king and blesses the throne. Then he places a golden crown over the king whereby the king attains dignity, splendour and honour. He then puts on a royal hat over his head. He then kisses with his two lips the breast of the king. The king then gives presents to all those who have thrown over the king precious things (as a symbol of homage)."

(8) From the letter of Dastur Tansar, the head priest of Ardeshir Babegan to king Jasnafshah of Tabristan, we learn that the head priest announced with a bold voice to the assembly the name of the new king. He said: "The Divine powers have chosen such and such a person as the King. You also accept him." Having said this he enthroned the King and crowned him. He then said to the King: "You accept from God the religion of Zoroaster which (your predecessor, King Gushtasp the son of Lohrasp, had accepted." The King accepts that and adds. "By the Grace of God I will do good to my subjects."

From the above description of the coronation of Iranian kings, we find that there are several points of similarity between it and the present British coronation of a Christian king.

1. In both, it is the Arch-priest or Archbishop who crowns the king. He is assisted by other priests of rank. In Persia, the Mobadan Mobad was assisted by three Mobads. In England the Archbishop of Canterbury is assisted by other bishops of rank.

2. In both it is the Arch-priest who enthrones the King. The Mobadan Mobad did so in Persia. In England it is the Archbishop, who with the assistance of other priests carries the chair known as King Edward's Chair near the throne and makes him sit in that royal chair.

3. In both, the Archbishop blesses the sovereign. In the British coronation ceremony, the Archbishop thus blesses the sovereign.

"The Lord God Almighty, Whose ministers we are, and the stewards of His mysteries, establish your throne in righteousness that it may stand fast for ever more like as the sun before him and the faithful witness in Heaven."

Here the Sun is referred to in the blessing. In the Afrin (blessings) of Zoroaster over the then King Vishtasp, known as the Afrin-i-Spetaman Zarthusht, we read:—"aurvat aspam

bavabiyatha hvare" i.e., May you be as swift-horsed as the Sun.

4. In both, the Arch-priest kisses the King. In Iran the Mobadan Mobad kissed the King over his breast. In England the Archbishop of Canterbury kisses him over his hands.

5. In both, the King distributed gifts after the coronation.

6. In both it is the Arch-priest who makes announcement of the new King coming to the throne. In the British Coronation ceremony this announcement is spoken of as "The Recognition."

7. In both, the Arch-priest asks the new King to follow the established faith of the country. In Persia, the Mobad asked the King to accept the religion of Zoroaster. In England the Archbishop of Canterbury asked him to follow the faith of Christ Jesus.

8. In both, the Arch priests offer something as a symbol of kingship. Among the ancient Persians, the Mobadan Mobad gave a chakra or wheel. In England the Archbishop of Canterbury gave a ring.

9. In both, the orb appears as a symbol of sovereignty. In the Persian Coronation scene we do not see it given to the King, but we see it on his head in the sculpture of Ardesbir. In the British coronation it is formally handed by the Archbishop to the King.

SOME ANCIENT INDIAN CORONATIONS.

The Coronation Durbar has brought forth a great deal of interesting literature on the subject of Coronations in Ancient India. The Indian Periodicals are full of them. The following will be read with interest by our readers. (Ed. I.R.)

I

Coronation Rites during the Vedic Period.

The following is an account of the ceremonies observed during the Coronation of Hindu Kings in the Vedic period —

The ceremonies in the Epics are, no doubt, based on the older Vedic rites. These rites differed in different Vedic schools. All Vedic schools, however, dealt with the Rajasuya sacrifice. But in some of the Rig Vedic schools, the Rajasuya rites were distinguished from the rites of the punarabhisheka or repetition of the anointment ceremony, or from those of the mahabhisheka or the grand ceremony of anointment. The coronation ceremony of Yudhishthira may be regarded as that of punarabhisheka or repetition, he having been already anointed at the time of the Rajasuya sacrifice.

Nevertheless, in ordinary use the abhishechaniya ceremony meant the anointment rites prescribed in the Rajasuya. A full and clear account of the ceremonies appears in the involved sacred literature of the Vajasaneyi schools. Vajasaneyi is the last of the Vedas, and being a Yajurveda deals specially with the rituals. Hence the Rajasuya will be described here from this literature.

SEVENTEEN KINDS OF WATERS COLLECTED.

For consecration, seventeen different kinds of waters were collected — 1. water from the Sarasvati. 2. water rising in front. 3. water rising from behind. 4. water flowing on. 5. water flowing against the main stream. 6. water flowing off the main stream. 7. sea water. 8. water of the whirlpool. 9. water of a standing pool in a flowing stream. 10. rain water falling during sunshine. 11. pond water. 12. well water. 13. must water. 14. honey. 15. the embryonic fluid of a cow calving. 16. milk. 17. clarified butter (ghose). 18. water heated by sun notes. It will be seen that the sacred waters are headed by that of the Sarasvati river. This seems to be a reminiscence of the oldest period, of the time of the Rig Samhita in which the Sarasvati is described as the best of mothers, of rivers and of goddesses, bestowing wealth, plenty, nourishment and offspring, and her breast yielding riches of every kind.

THE DRESSING OF THE KING

Before consecration the King was dressed by the priest. He was made to put on first an undergarment of silk (tarpya), then a garment of un-coloured wool, over which was thrown mantle (adhivasa modern chaddar). The King next wore a head dress (ushnisha), whose ends were tucked into the navel. Finally, he was armed with a bow string and three arrows.

STEPPING ON A TIGER SKIN.

Just before the consecration, the King was made to kick off a piece of lead tied in a tiger skin spread before the jars of consecrated waters and then stepped on the skin itself. The use of tiger skin is curious. It is taken in the *Brahmana* as symbolical; when Soma flowed through Indra, the latter became a tiger and therefore the tiger is Soma's beauty. But the symbolism seems deeper recalling the earliest periods, when the King was elected partly on account of his personal prowess, he having shown himself worthy of the office by having killed a tiger, that dreaded beast of the forest.

CROWNING.

This rite was followed by the placing of a small gold plate at the foot of the King. The priest then laid on the king's head the crown, a gold plate perforated with nine or hundred holes, saying "Might thou art, Victory thou art, Immortality thou art." This was the main feature of the coronation ceremony.

SPRINKLING WITH THE SACRED WATERS

The crowning was immediately followed by the consecration. Standing with arms raised and with the face to the east, the King was sprinkled in front with the sacred waters, first by the chaplain, and then by a kinsman, then by a friendly Rajanya (Kshatriya), and lastly by a Vaishya. The consecration was made by the priest with the following solemn hymn:—

"With Soma's glory I sprinkle thee. Be thou the chieftain of chiefs (*Kshatras*). Guard against darts (of enemies). O gods! Quicken him to be without rivals (enemies), for great chiefdom, for great lordship, for man-rule, for Indra's lordly sway, him, the son of such and such (man), the son of such and such (woman), of such and such class. O ye (people)! This man is your King. Soma is the King of (us) Brahmins."

CATTLE-RAID ON A CHARIOT.

A chariot was now brought inside the altar which the King yoked with four horses. Mounting the chariot, the king drove it into the midst of cows placed north of the *Ahatanya* fire. According to the Black Yojus (*Taittiriya Samhita*, I, 8, 15) a sham fight took place here, the King discharging arrows at a Rajanya posted with a bow.

ENTHRONING.

On his dismounting from the chariot, a throne-seat of *Khadira* wood, perforated and bound with thongs, was brought to the altar. The King placed the throne on the tiger's skin and spread over it a mantle. The priest then made the King sit on the throne, and touched his chest with the following hymn:—"He hath sat down, the upholder of the sacred law, Varuna, in the homesteads, for supreme rule, he, the wise" (*Vajasaneyi Samhita*, X, 27.) On this point the *Brahmana* remarks that the King, indeed, is the upholder of the sacred law, as he should speak only what is right and do what is right. This is the famous enthroning rite of the coronation.

PLAYING OF DICE.

Then followed two curious practices. The King was given five dice to throw, and was struck with sticks on the back by the priests. According to the Black Yojus, the 'jewels' now sat down in a circle round the King to do him homage. A priest handed to the King a sacrificial sword, which was passed round to the King's

brother, then to the minstrel or the governor, who handed it to the village headman, the latter passing it on finally to a tribesman. This tribesman with the sword marked the gaining ground, on which the priest threw down for the King the dice. The passing round of the sword evidently symbolises an acknowledgment of the power of the new King.

DRINKING OF TEN.

The great ceremony of anointment was followed by several other rites, such as *Dasapeya* or the drink of ten, the inauguration being naturally attended with much drinking of soma and other spirituous liquors. A year after the anointment on the full moon of the month *Jashtha* (May-June), came the rite of the King's hair cutting, which was followed by two smaller semi-sacrifices. The whole round was completed with the performance of the *Soutramani*. This was a combination of butter and animal sacrifices performed like the saving clause in an Act to expiate for any excess committed in the consumption of soma liquor.

II.

The 'Abhiseka' During the Coronation.

Mahamahopadhyaya Haraprosad Shastri made the following communications on the Abhiseka ceremony of Hindu kings to the Asiatic Society of Bengal.

Kuveranda wrote a book on Hindu Coronation 400 years ago in Western India. He divided the ceremony in three parts:—

1. Propitiating the God Vinayaka, who originally an evil spirit, opposed to Aryan interests, has now developed into the benevolent deity Ganesa. This ceremony takes up a day.

2. The propitiation of the Planets, their presiding deities and assistant presiding deities with the worship of the homestead as a preliminary. The homestead is represented on a raised square altar divided into 1,024 smaller squares 21 smaller squares at the corners are neglected and it is called a homestead of 1000 squares on which 45 different Gods are worshipped with offerings and oblations of ghee. After the propitiation of the planets, the coronation pandal is decorated with flags, flag-staffs and pots full of water from various places, and the throne is brought and consecrated. This may take two or three days or more.

3. The King is bathed. His different limbs are smeared with mud from different places then he gets a warm bath, consecrated water is poured on his head from different pots by the priests chanting Veda mantras. He then consecrates the Crown, the staff and other paraphernalia of royalty. He is brought in his Royal robe in front of the throne when the crown is placed on his head, the sceptre in his hand and the band round his shoulders. A *tilaka* is put on his forehead. He is then assisted by the priests and his relatives to ascend the throne. There holy water is sprinkled upon him from the consecrated pots. He receives first the benediction of the priest, then the homage of the priests and the nobles. This occupies one day.

III.

Coronation Oaths of Hindu Sovereigns.

Writing in the Calcutta "Weekly Notes," on the Oaths taken by Hindu sovereigns during the coronation ceremonies, Mr Kashi Prasad Jayaswal says:—

A complete act of the coronation ceremony is to be found neither in any of the ritualistic works nor in any of the legal treatises. The sacerdotal *Sāraṇa Sūtras* concern themselves purely with particulars of the Vedic texts to be repeated and other functions of a ritualistic nature; the legal *Smritis* pre-suppose the knowledge of the ceremony, they only casually mention the *abhisheka* (the anointing). But 'Coronation' consisted of more than the repeating of the Vedas and the sprinkling of scented waters. It was coupled with a number of other functions which had a popular customary origin. Among these was the taking of the Coronation Oaths. Specimens of these oaths are preserved in the great encyclopedia of Hindu civilization, the *Mahabharata*, and there is reason to believe that the sacred vows were more or less stereotyped.

(a) "Do you swear from your heart, by word of mouth, and in fact, I will take care of and tend the country regarding it as the Duty and thus ever and always."

(b) "I will act unhesitatingly according to the law as prevails here and in accordance with the policy of the Ethics of Government. I will never act arbitrarily."

These two were the fundamental solemn promises made by one who would the next moment become King by the answer given to him in the traditional phrase. Let it be so (abhisastur). That these were the stereotyped forms may be inferred from the fact that the portion embodying them is declared to be of the *Śruti* authority of the highest order *śrutishā pāra* 112, 110 amongst men.

IV.

The Divinity of Kings

In the course of a letter dated 2th November to the London correspondent of the *Bombay Gazette* Sir George Birdwood writes:—

As to the Hindu doctrine of the divinity of Kings and Kingship, there is great exaggeration in what is being said. They are sacred because everything is sacred among the Hindus. A King,—any effective ruler, is regarded as an incarnation of eight divinities: the "Moon" light, the "Sun" light, the "Wind," "Fire," "Dew" or "Rain," "Water" and "Wealth," and "Death" (Yama). They are all eight actual gods, and you see that when I translate their names they are all elements, save Death, for wealth means "precious metals," they are the "Hot and Cold, the Moist and Dry, and again, the Earth, Air, Water and Fire" of which all flesh is made. The King is a god, but so is a teacher, the King's shadow must not be trod on, and so must not be the teacher's nor that of any reddish brown animals! But let a King cease to be virtuous, in any way, and his divinity, his kingship is gone.

V.

People's Consent for the Coronation.

A writer in the December number of the *Modern Review* briefly describes ancient Hindu Coronation. According to the writer the consent of the people had first to be obtained to the proposed Coronation, and if the prince was unworthy, the people had the right of rejecting him and taking a king from among the common people. The writer says:—

In accordance with the old system of *Ashramas*, even the biggest *Raja* had to enter the *Vanaprastha* after having fully enjoyed the *Grāhastha Ashrama* and having reigned successfully to the entire satisfaction of the *Prāja*, the people. At the time of his retirement he would propose his eldest son, if he considered him to be the fittest before an assembly of *Brahmanas*, the feudatory chiefs and the citizens, to be his successor. The people judged the proposed *Yuvaraja* from his previous actions, which determined his valour, his piety and goodness, his character and conduct; and if it was found, in their opinion, that the proposed person would not be a useful *rāja* for them, they would reject him in spite of their *rāja's* proposal. Nay, even the *rāja* himself would reject him and disinherit his own son if he was not useful for the nation and would take (adopt) a brave one from among the commonest folk.

The writer quotes chapter and verse from the *Ramayana* for his statements. King Dasaratha in the *Ramayana* is represented as making himself doubly sure that he had the consent of his subjects in trying to crown Rama. The will of the people would be taken in a Durbar convened for the purpose, and such a Durbar had of necessity to be convened under the tradition, convention and unwritten law of the time. The writer says:—

It may be noted here that a grand Durbar had to be held by the ruling *rāja*, in which the proposal had to be made and the consent of the people taken. It is said in the *Ramayana* that on the occasion abovenamed *Raja Dasaratha* invited all the feudatory chiefs, the citizens of different towns, and the great landlords most cordially, and made them his guests, and honoured them by giving them suitable houses to live in, and valuable dresses and ornaments to put on, and met them himself well dressed and decorated with jewels. Finally the Durbar was held in which all the invited persons sat facing him.

For a description of the actual ceremonial of coronation we refer our readers to the article itself.

VI.

The Coronation Ceremony Described.

Mr. Monmohan Chakravarti contributes a learned article, to the *Indian World* for December on the subject of the ancient Hindu coronation. Having quoted two passages relating to the coronation ceremony from the two great epics of India the writer proceeds to tabulate the essentials of the ceremony. He writes:—

On analysing these accounts we find that the *Rajasuya abhisheka* was quite different from the coronation *abhisheka*. The essentials in the two Coronation accounts, however, agree in many particulars. According to them, the Coronation ceremony involved the following important functions:—

- (i) The bringing of sacred waters from rivers and seas;
- (ii) The presence of kinsmen, citizens and merchants during the ceremony;
- (iii) The covering of a throne with tiger-skin,
- (iv) The placing on this throne of the King and the Queen;
- (v) The anointing of the King with the consecrated waters, first by the priests, next by the kinsmen and then by the subjects present;
- (vi) Concluding with gifts to the Brahmanas and other persons present.

And then follows a description of how coronations were celebrated by the people. The *Ramayana* is drawn upon for the purpose. We quote the passage in full:—

The ceremony was observed with great rejoicings not only in the King's palace, but also in the capital and elsewhere. A good idea of the different kinds of rejoicings held in the city can be formed from the *Ramayana* in its description of the celebration of Rama's proposed accession as heir-apparent. In view of the present celebrations, this description is worth noticing here.

"Then the citizens, hearing of Rama's anointment and seeing the break of day began to decorate the city. The turrets, like white clouds, the temples, the cross-ways, the roads, the places of worship, the houses, the merchants' shops filled with goods, the peasant houses filled with relatives, the assembly places, and the trees were marked with flags and streamers. The crowd listened to the pleasant songs of singing bodies of Natas and dancers. The people talked about the coronation of Rama in houses and cross-ways, while the children playing at the doors talked to one another of this Coronation. For this festival the public roads were made pleasant with offerings of flowers and made fragrant with incense. In case of a night tour, trees of lamps were erected on all side-roads. . . . To see Rama's anointment people from provinces poured into the city and filled it up."

Having dealt with the coronation ceremonies as described in the Vedas, the writer concludes with the following passage:—

Though the Coronation ceremonies in England differ strikingly from the old Hindu ceremonies, not a few points of agreement will be noticed by the observant student.

The four principal ceremonies, the anointment, the investiture, the enthronement and the crowning are found in both. The anointing is followed in both by the symbol of election, The English anointment is however, made not with waters, but with olive oil, (in the older days with chrism, a mixture of oil and balm) when the king is seated on the historic stone of Scone, in the chair called after St. Edward. During the investiture three swords play a prominent part, while during the anointment the ampulla containing the consecrated oil. At the time of enthronement the king is surrounded by the Peers, spiritual and temporal, who render him homage, the present title of the king being "King of the United Kingdom of Great Britain and Ireland, of the British Dominions beyond the Seas, Defender of the Faith, and Emperor of India."

So many agreements in the essential rites cannot be accidental. Do they point to some common origin in the Indo-Germanic family before they had divided? If so, the inauguration ceremonies must be the survival of a pre-historic period, when the Aryans were living in a nomadic hunting stage.

King George's Speeches on Indian Affairs.

PART I.—A complete collection of all the speeches made by His Majesty during his tour in India as Prince of Wales.

CONTENTS.—Reply to Bombay Corporation; Speech at Prince of Wales' Museum; Speech at Alexandra Dock; Reply to Central India Chiefs, Indore; Reply to Udaipur Maharaja; Reply to Jaipur address; Jaipur Banquet Speech; Reply to Bikanir Maharaja; Reply to Lahore Municipality; Reply to Peshawar address; Reply to Jammu Maharajah; Reply to Amritsar Municipality; Speech at Khalsa College; Reply to Delhi Municipality; Reply to Agra Municipality; Unveiling Victoria Statue, Agra; Speech at the Gwalior New Market; Reply to Lucknow Municipality; Speech at Lucknow Medical College; Reply to Talukdar's address; Reply to Calcutta Corporation; Speech at Calcutta Victoria Memorial; Reply to Rangoon Municipality; Opening of Rangoon Victoria Park; Reply to Mandalay Municipality; Reply to Madras Corporation; Reply to Madras Landholders; Speech, Victoria Technical Institute; Reply to Madras Citizen's address; Speech at Mysore Banquet; Speech at Chamarajendra Institute; Reply to Bangalore Municipality; Unveiling Bangalore Victoria Memorial; Speech at Hyderabad State Banquet; Reply to Benares Municipality; Reply to Quetta Municipality; Reply to Karachi Municipality; Unveiling Victoria Statue; Speech at Guildhall, London.

PART II.—Full text of all the speeches delivered by His Majesty during his Coronation Durbar Tour in India. **WITH PORTRAITS. PRICE RE. ONE.**

To subscribers of the "Review" Rs. 12.

G. A. Natesan & Co., Sunkurama Chetty Street, Madras.

awakened from one end of the Province to the other, in the hearts of the people of Bengal, an impulse of gratitude, which, he was sure, would remain the permanent heritage of their race (Applause). The modification of the Partition had been the dream of their lives and the most cherished aspiration of their souls. With the eye of faith they gazed on the promised land, but none of them in their wildest dreams could have persuaded themselves to believe that it would be the privilege of this generation to enter the promised land, but they had entered it. Their dream had been realised, and the hearts of the millions of their people were uplifted in prayer to the throne of the Supreme for the long life of him who had relieved his people of a prolonged national sorrow.

The following from the speech of Babu Ambica Charn Muzamdar will further show how Bengal has received the news —

What repressive laws, proscriptions, prosecutions, and deportations have failed to achieve in six years, the kindly touch of the Royal prerogative has accomplished in one minute. I repeat what I have recently said elsewhere, that if on the 23rd June, 1757 the battle of Plassey paved the way to the conquest of India by the British arms, the Coronation Durbar of George V. at Delhi on the 12th December, 1911, has led to the conquest of the hearts of the Indian people by the British Throne. If Edward VII saved South Africa, George V. has saved India, the brightest jewel in the British diadem. Gentlemen, while we are profoundly grateful to His Majesty, we cannot be unmindful of our deep debt of gratitude to those statesmen whose wise counsel and sound advice were instrumental in bringing about the present joyous occasion. The despatches of Lord Hardinge and of the Marquess of Crewe have now been made public, and it is no longer necessary to point out how those important documents prepared the ground upon which the monumental boon modifying the partition of Bengal has been based. I am no prophet, but it requires no gift of prophecy to foretell that Lords Crewe and Hardinge will go down to grateful posterity as the saviours of Bengal and the Bengalee nation.

The rest of the speeches in the Congress touched the same key.

THE PRESIDENT'S SPEECH.

Pandit Bishen Narayan Dhar in his presidential address touched upon most of the important questions that at present agitate public mind. His speech was a luminous survey of the causes of the misfortunes of India :—

The root cause of most of our misfortunes, which if not corrected forebodes serious disasters in the future, is the growth of an unsympathetic and illiberal spirit in the bureaucracy towards the newborn hopes and ideals of the Indian people. While a new India has gradually been rising up, that spirit too has been growing and so, the critical situation has arisen. On the one hand, the educated classes, filled with new knowledge and conscious of new political rights but hampered by the bars and fetters of a system perhaps good enough for other days

but now obsolete; on the other, the bureaucracy with its vested interests, its domineering habits, its old traditions of absolute and unquestioned authority, suspicious of knowledge and averse to innovation like every close corporation, cut off from the people by its racial exclusiveness, and wedded to a paternal system of government under which it has so long enjoyed power and pelf but which is discordant with the more liberal ideals of the present day.

He traced the effects of this illiberal spirit of the bureaucracy during the last fifty years, the most serious being the introduction of class representation in the Legislative Councils. Pandit Bishen Narayan Dhar asked :—

What moral effect is likely to be produced by separation *plus* class privileges upon our national character? Is it good that our political institutions should be placed before us in the light in which we should see that ignorance and knowledge, poverty and riches, numerical strength and weakness stand on the same level so far as the possession of political rights is concerned? If in every civilised country, knowledge, property and numbers are the measure of political fitness, what would be the effect upon our national character if we are accustomed to think that the reverse is the case here—that Mahomedans because they are Mahomedans deserve favour, that Hindus because they are Hindus deserve its opposite—that right and wrong are not in the nature of things but are the creations of Government? Besides, what sort of citizens does the British Government wish to produce in India—such as shall be self-respecting and justice-loving, taught to love knowledge, truth, courage, independence and equality of civil rights, or, such as shall be unjust, corrupt, destitute of manliness, careless whether their political rights are respected by others or trampled under foot? If the former, then Government must show that it values justice, and respects those who respect themselves. How can Government discharge its high and noble function if we are placed under institutions which are based upon the perversion of all those high principles which we have hitherto been taught to hold sacred and inviolable?

Referring to the Hon. Mr. Gokhale's Elementary Education Bill, the President said :—

While the universities movement is an indication of our national activity in the sphere of high education, the discussion started by Mr. Gokhale's Elementary Education Bill shows that we are becoming alive to the importance of improving the mental condition of the masses. The charge is often brought against the educated class that they are indifferent to the well being of the general community and care for nothing beyond the satisfaction of their own political ambition. Mr. Gokhale's Bill is a sufficient answer to that charge.

As regards the provision for the levy of a special education rate, I for one agree with those who think that the whole liability for elementary education rests upon the shoulders of Governments; but when the Government says it cannot afford the cost of such a measure, then the only course left open to us is to draw upon our own limited resources in the shape of a local education rate and ask the Government to contribute a

certain proportion from its own exchequer. If we care for mass education—if we feel that we owe a duty to those who cannot help themselves—then we ought not to grudge a small local education rate, which will fall upon us no doubt, but which we should be prepared to bear in the cause of our own people.

THE RESOLUTIONS.

The resolutions adopted on the two days followed the usual lines and there was nothing particular about them. Among the most important was Mr. Gokhale's Bill to which the Congress gave its unanimous support. In supporting the resolution Mr. Gokhale once again refuted the objections raised against it and the following is a summary of his speech.

MR. GOKHALE'S SPEECH.

Those of them, who looked upon mass education as the root of true national progress and who cherished the aspiration to see the system of universal education had the gratification to see how the Bill was being supported. It was true that here and there a note of dissent had been heard, but that note had been drowned owing to emphatic approval with which the Bill had been welcomed by the masses. It was a most hopeful and significant feature of the whole situation. It was the surest guarantee of the ultimate success of the Bill. When the whole people had made up their mind for a reform that reform could not be withheld. But the struggle which lay before them was a long one and they must press forward and they must be united. Without a sort of compulsion it is impossible to have mass education. That was the experience of the whole civilized world. They must take that as the starting point. Referring to the grant of 50 lakhs of rupees more by the Government of India, the Hon'ble Mr. Gokhale said that it would not meet their requirements. What they wanted was the system of introducing Elementary Education. Referring to the point below that compulsion was to be introduced, the Hon'ble Mr. Gokhale said that compulsion should be introduced only in selected areas—area by area, if that area was ripe for it. The next important question was about the exercise of the authorities. They all knew that there were two authorities, Central authorities and Local authorities. As regards the Central authority, Mr. Gokhale said that in future there was no chance of getting any assistance from the Government of India. There was the other authority, and as the people had some voice in the Local Bodies, they must turn to the Local Bodies for exercising the authority of introducing compulsion. Dealing with the Financial Clause of the Bill the speaker said that the Central Body should bear a great deal of expenditure and that body should be induced to bear two-thirds of the expenditure. There were also some other questions he liked to refer to. The first of them was about making education free. That clause was omitted, as a sort of compromise to meet the official views, but as official views were against the Bill, he had decided to go in for free and compulsory Education, together. That was a change which could be easily introduced in the Bill.

Another objection was raised by the Mahomedans. It was said that this Bill would force the Mahomedan boys to learn a language which was not their own. The speaker was willing to add in the Bill a Clause to the effect that where there were 25 boys or more, speaking one vernacular a provision should be made for teaching that vernacular; but where the number of boys was less, discretion would be left to the Authorities. Regarding the Bill itself the speaker said that if the Government were pleased, the Bill would be referred to a Select Committee. But seeing that the Local Governments had gone against the Bill, he was not certain that the Government of India would so refer. If the Bill was rejected, he earnestly hoped that his countrymen would not be discouraged. He trusted that the defeat would stimulate them to redouble their energy and they should carry the agitation on to England. In conclusion he asked them, young and old, high and low, to ignore their minor differences and to press forward their cause.

INDIANS IN SOUTH AFRICA.

The position of Indians in South Africa is still an unsettled question and the following interesting summary of Mr. Polak's speech at the Congress deserves to be recorded.—

When the Asiatic Immigration and Registration Act was passed, the Indians in South Africa adopted a movement known as the Passive Resistance, which was vigorously carried only until May last. If the Indians had given up that scheme they would have been guilty of casting a slur on the honor and good name of their Motherland. When the movement continued the Government arrested the principal leaders of the Indian and Chinese communities. In the meantime measures were adopted to petition the Home Government about the indignities suffered by the Indians in South Africa, and urging the immediate repeal and expulsion of the Act from the Statute Book. In reply, they were told that it was more in consonance with the sanction of His Majesty that the enactment was passed into Law. Accordingly, passive resistance continued with greater rigour, and many more Indians were sent to prison, and thus made to suffer all kinds of harsh treatment. One of their passive resisters was the previous speaker, Mr. Sorabjee, who for the sake of his country had to sacrifice everything that he valued in life and had to go to Jail for no less than eight times. That gentleman was leaving India immediately by the first steamer for South Africa to ward off any hitch that the provisional settlement might create. Mr. Polak on his own behalf, and on behalf of the Indians in South Africa, tendered to the Indians assembled in Congress their respectful and cordial thanks for the timely pecuniary assistance rendered to them during the hour of their sore trial, when widows and orphans were starving. He also paid a great compliment to Mr. Ratan Tata for his munificent gift, and also referred to the assistance given to them by the late Mr. V. Krishnaswami Iyer. The Union Government had at last begun to realize something of the potency of the movement of Passive Resistance and in the House of Parliament assembled, Mr. Smith, the Minister of the Interior, paid a glowing tribute to the integrity, self-sacrifice and devotion of the passive resisters in Transvaal. The Government had at last agreed to grant them their demand, namely the repeal of the Registration Act.

The two other disabilities were (1) that immigration to Orange Free State should be removed, and (2) that the rights of the Indian Colonists in Natal and Cape Colony should not be diminished. If these were not granted Mr. Polak was afraid that there would again be a recrudescence of passive resistance. He next brought to the notice of the Congress that Indian residents in the suburbs of Johannesburg were under notice to remove absolutely their business by the 15th of February next by virtue of an Ordinance passed in 1906. If that was enforced it would spell ruination to a thousand families. He trusted that they would not have to face that evil.

ALL-ROUND RETRENCHMENT.

Mr. D. E. Wacha with his usual eloquence and vigour moved the resolution urging that early steps be taken for effective retrenchment in all the expending departments of the Imperial and Provincial Governments, and specially the Military Department. He said that the resolution was broad enough and the reason why the Military Department was specially mentioned was that military expenditure was the "octopus" of the Indian problem. So far as the civil expenditure was concerned he hoped Government which was making retrenchments, would not starve the people. As regards military expenditure he hoped that the Committee now appointed would look minutely into this matter.

Mr. Pramatba Nath Bannerjee who supported the resolution, reviewed the growth of the expenditure since Lord Curzon's time, the eventual result of which was increased taxation. He complained of the heavy army expenditure and thought it was unfair that the army in India should be maintained as an Asiatic reserve for the British Government.

COTTON EXCISE DUTIES.

Mr. D. A. Khare in moving a resolution urging the abolition of the Excise duties on Indian cotton said that though the amount of revenue affected by this resolution was not even half a crore, yet the principle involved in it was great. The principle involved in it was whether they would handicap those industries which they had started. Everybody was convinced and every Englishman in this country would admit that these duties

were unjust. The merchants and the publicists here agitated for the abolition of these duties, but the Government supporters said that in spite of these duties the mill industries in Bombay had thrived and these duties were levied on the produce only. But that was not the case. If those duties could not be abolished he urged that the money derived from those duties should be devoted to education on textile industries.

The Industrial Conference.

The Industrial Conference held its sittings on the 29th Dec. and the Hon. Mr. Dadabhai occupied the chair. In the course of his eloquent address he surveyed the industrial condition of India at the present time and laid stress upon the fact that the industrial problem is the real problem of India. He said:—

(I place the industrial regeneration of India above all other Indian problems in importance, it opens up auroral visions of a happy and prosperous future,—of the revival of the "Glorious Ind" of the past. Political power, according to the teachings of history, is handmaid to industrial success, and value as I do the political advancement of my countrymen, I cannot but feel that the greatest block to it is their present industrial prostration. A country notorious for lack of initiative and enterprise, dependent upon foreign supply for the everyday requirements of life, with sources living narrow, circumscribed and restricted—it would be a wonder if the people were not held in political subordination. Political servitude follows Commercial and Industrial servitude as sure as night the day. It is almost a Natural law, rigorous, unrelenting and unsparring in its operation. Revival of the Indian industries therefore offers the most productive and promising field for the labours of the patriots and the statesmen. We must go to the root of the evil, and treat the disease at its source, the pathological conditions must be removed. The pangs of hunger must be satisfied, and all experience shows industry and commerce provide the most effective means.

He said that one of the chief causes of Indian unrest is the economic destitution of the people:

It would be wrong to ignore it; it will be equally wrong to ascribe the whole to a mere yearning on the part of the people for political power, or to the impulse and the gospel of hope which Japan has imparted to Asia. There are potent factors—active, pregnant, contributory causes. There are other powerful causes at work. The poverty of the people, absence of careers for the millions, contraction of the productive sources of wealth, unequal competition, absence of commercial facilities and fiscal autonomy, and above all, the general, albeit unfortunate, belief that the advancement of British industrial interests forms the animating principle of British Indian Rule;

these felt, perceived, and realised by the people more and more with the spread of education and increasing knowledge of other countries, as well the volume of discontent and give point and shape to it. "The rebellions of the belly are the worst," and "the surest way to prevent seditions is to take away the matter of them" which is "want and poverty in the estate." This is an eternal verity the force of which does not suffer by age. Lord Bacon's dictum is as true to day as when he first enunciated it.

After referring to the various needs for developing industrial efficiency such as capital, skilled labour, organisation of intelligence bureau about markets home and foreign, cheap transport and a scientific tariff, Mr. Dadabhai referred to the help which Government ought to give in putting down unfair competition :

The deadly influence of the unfair competition is best illustrated by the collapse of the Tata line of Steamships connecting Bombay with the Far East through the unfair competition of the subsidised British companies. The rates were temporarily reduced by these companies to a point, at which competition was impossible. Mr. Tata's memorials to Lord Cross, then Secretary of State, and Parliament were unheeded. The natural result followed. The scheme failed. It is the sort of unfair competition which has to be put down. The British Government would make itself infinitely more popular than it is now by a sympathetic consideration of Indian claims in these matters. Sympathy in Government is essential;—sympathy, not only with the political aspirations of the people, but with the industrial interests as well, is the redeeming feature, especially of alien Governments.

He made the following plea for fiscal autonomy:—

India must be governed in Indian interest. Amelioration in the condition of the people and their industries should be the first concern of the Government of India, and where the interests of the foreign manufacturers clash with those of the Indian the Government ought to stand out unhesitatingly as the resolute champion of the latter. But, as I have stated above under existing conditions the Government of India's powers are limited, and any great reform in its industrial policy must begin with the attainment by it of complete fiscal autonomy in matters affecting the country's trade and commerce. Once this is conceded, we might appeal to Government with greater effect for protection, the abolition of restrictive tariff, the grant of bounties to new and struggling industries and for the pioneering of new industries. Both the latter methods have proved eminently useful in industrially-advanced countries. English public opinion is slowly veering round to our side. The *Morning Post* of London in March last remarked.—

"The Imperial Government cannot in the long run refuse to allow the elected representatives of India to determine her fiscal policy. Sooner or later India will adopt protection."

STATE PIONEERING OF INDUSTRIES.

The bounty, fed sugar of Germany and Austria is a powerful competitor in the world's market and the Japanese Government has manufacturing departments in which Japanese talent is employed. In 1887 Principal Dyer counselled the Government of Japan to establish the confidence of the people in new industries by itself taking the field as a successful manufacturer. Japan took the hint and we know the result. Forty or fifty years ago the Japanese were as shy and timid as any son of India. The State in Japan has trained the people in State schools and factories, and has put heart in them by precept and example. Here in India too the success of the method can be seen within the dominion of that enlightened Prince who has before given us sage counsel from this platform.

Why should not these precedents be followed by the Government of India? It is precisely in this way that new industries can be introduced into the country, and the capital of the people employed in their support. The most improved process can be shown in that way alone. Manufactures are exclusive. Much in the line of disseminations of industrial instruction cannot be expected from them. The point is Government can, by setting up factories, demonstrate to the people the working and the utility of improved Western process. Government factories would specially supply industrial knowledge. Government should also, through the British Consuls stationed in the various countries get detailed reports of newly invented manufacturing processes and adopt them in their own factories which will prove distributing centres of light and instruction.

THE RESOLUTIONS AT THE CONFERENCE.

Twenty four papers were received by the Secretary and eleven more Resolutions were adopted, urging the establishment of a fully equipped Polytechnic College in India, an enquiry into the causes of failure of several industrial enterprises and the anomalous character of the existing Railway rates. The Conference appointed a Committee to see that the Government order for the purchase of country made articles was carried out and to offer suggestions in regard to the Credit Societies, Life Assurance and Provident Societies Bills pending in the Supreme Legislative Council. The Conference also urged the establishment of a Department of Industry in every province, to supply advice in regard to the new industries, to introduce new methods and processes, to carry out experiments, to develop selected industries, to organise an Industrial and Commercial Exhibition and to establish a Museum and a Bureau of information. The Conference urged the Government

to abolish the system of Indian indentured labour. A Resolution was adopted calling upon the Government and the people to encourage Indian manufactures, utilise mineral resources, to pray for the repeal of Excise duty on cotton goods, the introduction of standard weights and measures and to affiliate the Commercial Colleges to the Universities.

The Social Conference

The Social Conference was held on the same day and Mr. A. Chaudhuri was elected President. He addressed briefly and began by saying that the time had come when the people should do something for the improvement of their Society. Social progress, according to him, must evolve from inside. They had been thrown into the vortex of a civilisation which had gained ground in the country and it would be well for them to keep their house in order. They owed a duty to themselves and to their country, to unite their efforts for the regeneration of their society. He looked upon the question of prevention of early marriage as an economic problem and, owing to the changed circumstances, it was not possible to marry early. Regarding the elevation of the depressed classes, the President said that it was their duty to extend their hand of fellowship to the depressed classes. He supported female education.

The Temperance Conference

The Temperance Conference was held on the 30th at the Overtown Hall at which Mr. Venkattrathanan Naidu presided. The Hon. Babu Dehuprasad Sarbbadbhikari, Chairman of the Reception Committee, said that the Excise returns proved that drinking was on the increase, and quoted figures to prove this contention. The situation demanded very different treatment to what it was receiving at the hands of the Government at present, and they hoped for the day to come when India would demand that liquor and drugs which degraded and demoralised this great land

should no longer be manufactured within its borders.

Resolutions requesting that the Government should take means to check the growth of drink habit and expressing the opinion that scientific temperance teaching should be introduced in all schools in India and satisfaction at the steps taken to prevent drinking amongst Khonds, Khasias and other Aborigines and calling upon the leaders of the people to take a determined stand on the subject of temperance were carried.

The Theistic Conference.

The Theistic Conference though mentioned last was the first among the Conferences held. Mr. N. Ragnanibayya of Mangalore presided and he enunciated the theistic principles thus:—

(a) Among its foremost principles is that the Supreme Spirit is one, Indivisible, and that it is Immanent in the Universe, in the outside Nature, and in the mind of man, and that the whole Universe is the working of the Spirit, that it is man alone among all the sentient creatures that is capable of understanding it, that he is called Brahma by the Vedanta, or Jehovah by the Jews, or the Allah by the Mahomedans, it is the same by whatever name you call it.

(b) Secondly, there is no need of developing our faculties or powers extraordinarily in order to understand or know the Supreme Spirit; that it is given to man by his ordinary powers to understand and know it by proper exercises of devotion and love;

(c) Thirdly, these exercises of devotion and love consist in uttering the names of God with a fervent heart and seeking Him in the recesses of one's own heart, in firmly believing that He is always close by and hears your prayers, and that they never go unanswered;

(d) Fourthly, that to obtain grace and purification of mind and heart there is no necessity of a Mediator and that all perception is direct and immediate, and that communion with the Infinite is possible in this very existence, that the communion consists in the altered attitude of the soul towards the Supreme Soul, that scriptures, lives of saints and their history, might assist you in your exercises of devotion and piety but can never supplant them;

(e) Fifthly that ceremonies and rites have no efficacy in them, and are only so many hindrances so far as they come in the way of realising the presence of God;

(f) Sixthly, that so far as the worship of God is concerned there is no distinction between class and class, high and low, rich and poor, aged and young, healthy and sick; that God reveals Himself to those who approach Him with a penitent heart and an earnest desire.

(g) Seventhly, that Spiritual truths are not the monopoly of any particular individual or race or age but He has been unfolding Himself always, that we have only to open our eyes in order to see Him and the glory of His work;

(A) Eighthly, that the service of God consists in the service we render to our fellow-beings, that the field for work and the exercise of all our high impulses and divine faculties in our own surroundings wherein we are required to work.

(i) Ninthly, that the reward of such service does not consist in fame or honour which are all of earthly, but in the blessedness we inwardly feel for the good work we have done and the peaceful rest we obtain at the close of our life;

(j) Tenthly and lastly, that this life is only a school and a preparation for a higher existence to come and all our joys are meant to show the ephemeral character of our being.

The Bhagavad-Gita.

BY Mr. A. WORSLEY.

In the October issue of the *Indian Review* a valued contributor Mr. P. V. R. Aiyar expounds ethical ideals deducible from this classic work.

We all know the result of criticising ethical systems from the standpoint of pure philosophy, yet such criticism cannot be called out of place when applied to any ethical system which claims to depend on a philosophic basis. Hence Mr. Aiyar has undertaken a task of peculiar difficulty, for he has to expound a system of ethics without transgressing philosophic dicta. All the more honor to him if he can succeed in his effort and convince philosophers that ethics are not outside the sphere of their thought and work; for the three greatest moralists—Christ, Confucius, and Gautama the Buddha*—all failed to reconcile Ethics and Philosophy.

"We all recognize the exceeding difficulty of rendering the peculiar technical philosophic terms of one language in the medium of a foreign tongue, and this difficulty is most manifest when it is sought to transcribe the fine distinctions of Hindu philosophy into the English language—a language which, notwithstanding its facility of expression, is poverty-stricken in philosophic terms. I thus seek already to excuse the criticism I am about to make, because it is almost certain

that the learned author of the article in question has a proper explanation of the passage to which I take exception.

He says* "The theory that Nature is a transcendent illusion due to the Will of God gives to the human spirit the 'peace of God which passeth the understanding.'" But, I would ask, does he find this theory in the *Bhagavad-Gita*? It sounds to me, as here rendered, more like Persian theology than Hindu philosophy.

To the Western student the word "Will" is a relative term which is only predicateable in connection with objects, and is synonymous with Wish or Desire. How then can the "Wishless One" will, or the Omnipotent desire? It is said that Brahman is without Fear, Desire, etc.

Let us rather think that the great illusion is due to our own ignorance or incompleteness; let us predicate Nescience as subjective not objective, and say that in this "moment of forgetfulness" the mind is obscured, but that with the awakening will come disenchantment.

It may be replied that, in such case, this nescience is the "Will of God." But against this it would be said that this assertion is incapable of philosophic proof. Nescience is inscrutable, and should not be predicated without proof; but where Illusion is admitted, Nescience is admitted. Hence subjective nescience is admitted. But objective nescience is not admitted, nor is it necessary to monism.

Hence that word "Will" is full of trouble to Western students, and we put our pen through it whenever we can. We also make it a rule not to impute causes, but to see the cause in the effect.

For instance there are many who agree with the author in saying that the objective world (Nature?) is an illusion, and who would lay the blame on their own ignorance. But directly he began to talk about "Will" they would part company with him at once.

* I have placed these names alphabetically.

IN MEMORIAM.

TO THE MEMORY OF V. KRISHNASWAMI IYER
BY K. S. RAMASWAMI SASTRI

I.

Bereaved mother! mourn the loss of him
Who left the world the poorer for his death!
Ah! bitter tears thine eyes' bright radiance dim.
With quivering frame and agonised breath
Thou gazest on the manly massive face
Now stilled in wakeless sleep, and lightning eyes
Now closed for ever. His mind's impetuous ways
And hungerings for sweet *Sānti's* paradise
Ah! thou shalt see no more, oh never more.
For he has crossed Death's bitter seas
And reached its farther mist-wrapped shore
Where shines Eternal Peace.

II

Fair mansions lit with blossomed flowers of fire
And cooled by noiseless fans swift-circling round,
The rarest things that men do now desire,
All wonders in the realms of sight and sound
Were at his feet. But like some ancient sage
A simple life he led untouched by pride.
The world before him lay an open page
And he the God immanence there discerned.
He lived with but too little hold on earth
And towards higher realms he has now gone—
Has passed the night of earthly birth
And lives in Heaven's bright dawn.

III.

What love he felt for thee, my India sweet—
So passionate, pure, adoring, and intense—
I take some libation at Thy lotus feet
He poured his wealth and mental affluence.
The deeds of Thy great heroes fired his brain
And made him yearn for that most glorious day
When Thou shalt give all lands new psychic gain
And lead them in the blessed Godward way.
His raptures, expectations, golden dreams
For exaltation of Thy might—
Must they like sun's bright setting beams
Be lost to worldly sight?

IV.

Twin gifts of God to soothe the soul and frame—
Our Vedic and our Ayurvedic lore—
A dying life they led to India's shame
Like vagrants expelled from a loveless door.
He welcomed them and praised their beauty fair
And made them lords of all his wealth's increase.
They grew in glory by his fostering care
And dowered the world with health and mystic [peace.

Alas! the gods who gave him love and power
The gift of death too early gave.
The fires of his bright manhood's hour
Are quenched in Death's salt wave.

V.

The married life of East and West so bright
Enthralled his heart and made him ceaseless toil
To lead *Ind* from her immemorial night
And fratricidal strife and wild turmoil.
Religion fair with glorious eyes upcast
And science content with hard work on this [earth—
He sought to make them loving friends at last
And join in sweetening man's most humble [birth.

Alas! that he should die before his time
And see his work left incomplete,
Nor passionate thought nor tuneful rhyme
Can now approach his seat.

VI.

Ah! grieve not mother! he still works for thee.
Too full of love and unattained height,
He will return to solve life's mystery
And show to all thy wondrous spiritual 'night.
Co-operant with the great Eternal Powers,
He will thy glory's golden lamp relume
And through the yet unborn and Orient hours
He will disperse the nations' psychic gloom.
Ah! come, my brethren, let us now aspire
To live a dedicated life
And ever move onward, upward, higher
Towards love from selfish strife

THE LATE HON. MR. V. KRISHNASWAMI IYER, C.S.I.

The area of that province would be about 56,000 square miles and the population, about 5,000,000.

12. We elaborated at the outset our proposal to make Delhi the future capital of India, because we consider this the key-stone of the whole project and hold that according as it is accepted or not, our scheme must stand or fall.

13. But we have still to discuss in greater detail the leading features of the other part of our scheme. Chief amongst them is the proposal to constitute a Governorship-in-Council for Bengal. The history of the partition dates from 1902. Various schemes of territorial redistribution were at that time under consideration and that which was ultimately adopted had at any rate the merit of fulfilling two of the chief purposes which its authors had in view. It relieved the overburdened administration of Bengal and it gave the Mahomedan population of Eastern Bengal advantages and opportunities of which they had perhaps hitherto not had their fair share. On the other hand, as we have already pointed out, it was deeply resented by the Bengalis. No doubt sentiment has played a considerable part in the opposition offered by the Bengalis, and in saying this we by no means wish to underrate the importance which should be attached to sentiment, even if it be exaggerated. It is, however, no longer a matter of mere sentiment but rather, since the enlargement of the Legislative Councils, one of undeniable reality. In pre-reform scheme days the non-official element in the Councils was small. The representation of the people has now been carried a long step forward and in the Legislative Councils of both the provinces of Bengal and Eastern Bengal, the Bengalis find themselves in a minority, being outnumbered in the one by Beharis and Oriyas and in the other by the Mahomedans of Eastern Bengal and the inhabitants of Assam. As matters now stand, the Bengalis can never exercise in either province that influence to which they consider themselves entitled by reason of their numbers, wealth and culture. This is a substantial grievance which will be all the more keenly felt in the course of time as the representative character of the Legislative Councils increases and with it the influence which these assemblies exercise upon the conduct of public affairs. There is, therefore, only too much reason to fear that instead of dying down the bitterness of feeling will become more and more acute.

14. It has frequently been alleged in the press that the partition is the root cause of all recent troubles in India. The growth of political unrest in other parts of the country and notably in the Deccan before the partition of Bengal took place disproves that assertion, and we need not ascribe to the partition evils which have not obviously flowed from it. It is certain, however, that it is in part, at any rate, responsible for the growing estrangement which has now unfortunately assumed a very serious character in many parts of the country between Mahomedans and Hindus. We are not without hope that a modification of the partition which we now propose, will in some degree at any rate alleviate this most regrettable antagonism.

15. To sum up, the results anticipated from the partition have not been altogether realised and the scheme as designed and executed could only be justified by success. Although good work has been done in Eastern Bengal and Assam and the Mahomedans of that province have reaped the benefit of a sympathetic

administration closely in touch with them, those advantages have been in a great measure counterbalanced by the violent hostility which the partition has aroused amongst the Bengalis. For the reasons we have already indicated we feel bound to admit that the Bengalis are labouring under a sense of real injustice, which we believe it would be sound policy to remove without further delay. The Durbar of December next affords a unique occasion for rectifying what is regarded by Bengalis as a grievous wrong.

16. Anxious as we are to take Bengali feeling into account, we cannot overrate the importance of consulting, at the same time, the interests and sentiments of the Mahomedans of Eastern Bengal. It must be remembered that the Mahomedans of Eastern Bengal have at present an overwhelming majority in point of population and that if the Bengali-speaking divisions were amalgamated on the lines suggested in our scheme, the Mahomedans would still be in a position of approximate numerical equality with, or possibly of small superiority over the Hindus. The future province of Bengal, moreover, will be a compact territory of quite moderate extent. The Governor-in-Council will have ample time and opportunity to study the needs of the various communities committed to his charge. Unlike his predecessors, he will have a great advantage in that he will find ready to hand at Dacca a second capital with all the conveniences of ordinary provincial headquarters. He will reside there from time to time, just as the Lieutenant-Governor of the United Provinces frequently resides in Lucknow, and he will in this way be enabled to keep in close touch with Mahomedan sentiments and interests. It must also be borne in mind that the interests of the Mahomedans will be safeguarded by the special representation which they enjoy in the Legislative Councils; while as regards representation on local bodies they will be in the same position as at present. We need not, therefore, trouble Your Lordship with the reasons why we have discarded the suggestion that a Chief Commissionership, or a semi-independent Commissionership within the new province might be created at Dacca.

17. We regard the creation of a Governorship-in-Council of Bengal as a very important feature of our scheme. It is by no means a new one. The question of the creation of a Governorship was fully discussed in 1867 to 1868 by the Secretary of State and the Government of India, and a Committee was formed, on the initiative of Sir Stafford Northcote, to consider it and that of the transfer of the capital elsewhere. In the somewhat voluminous correspondence of the past the most salient points that emerge are:—

(1) That a Governorship of Bengal would not be compatible with the presence in Calcutta of the Viceroy and the Government of India;

(2) That, had it been decided to create a Governorship of Bengal, the question of the transfer of the capital from Calcutta would have been taken into consideration;

(3) That although a majority of the Governor-General's Council and the Lieutenant-Governor of Bengal (Sir William Grey) were in favour of the creation of a Governorship, Sir John Lawrence, the Governor-General was opposed to the proposal, but for purposes of better administration contemplated the constitution of a Lieutenant-Governorship of Behar and the separation of Assam from Bengal under a Chief

Commissioner. Since the discussions of 1867-1868 considerable and very important changes have taken place in the constitutional development of Bengal. That province has already an Executive Council, and the only change that would, therefore, be necessary for the realisation of this part of our scheme is that the Lieutenant-Governorship should be converted into a Governorship. Particular arguments have from time to time been urged against the appointment of a Governor from England. These were, that Bengal, more than any other province, requires the head of the Government to possess an intimate knowledge of India and of the Indian people, and that a statesman or politician appointed from England without previous knowledge of India would be no part of the country and his ignorance a greater drawback or be less able to cope with the intricacies of an exceedingly complex position.

18. We have no wish to underrate the great advantage to an Indian administrator of an intimate knowledge of the country and of the people he is to govern. At the same time, actual experience has shown that a Governor, carefully selected and appointed from England and aided by a Council, can successfully administer a large Indian province, and that province so administered requires less supervision on the part of the Government of India. In this connection, we may again refer to the correspondence of 1867-68 and cite two of the arguments employed by the late Sir Henry Maine, when discussing the question of a Council form of Government for Bengal. They are—

(1) That the system in Madras and Bombay has enabled a series of men of no conspicuous ability to carry on a difficult Government for a century with great success;

(2) That the concession of a full Governorship to Bengal would have a good effect on English public opinion, which would accordingly cease to impose on the Government of India a responsibility which it is absolutely impossible to discharge.

In view of the great difficulties connected with the administration of Bengal we attach the highest importance to these arguments. We are also convinced that nothing short of a full Governorship would satisfy the aspirations of the Bengalis and of the Mahomedans of Eastern Bengal. We may add that, as in the case of the Governorship of Madras and Bombay, the appointment would be open to members of the Indian Civil Service, although no doubt in practice the Governor will usually be recruited from England.

19. On the other hand, one very grave and obvious objection has been raised in the past to the creation of a Governorship for Bengal which we should fully share were it not disposed of by the proposal which constitutes the keystone of our scheme. Unquestionably a most undesirable situation might and would quite possibly arise if a Governor-General of India and a Governor of Bengal both selected from the ranks of English public men were to reside in the same capital and be liable to be brought in various ways into regrettable antagonism or rivalry. This indeed constitutes yet another and, in our opinion, a very cogent reason why the headquarters of the Government of India should be transferred from Calcutta to Delhi.

20. We now turn to the proposal to create a Lieutenant-Governorship in Council for Behar, Chota Nagpur and Orissa. We are convinced that if the Governor of

Bengal is to do justice to the territories which we propose to assign to him and to safeguard the interests of the Mahomedans of his province, Behar and Chota Nagpur must be dissociated from Bengal. Quite apart, however, from that consideration, we are satisfied that it is in the highest degree desirable to give the Hindi-speaking people now included within the province of Bengal a separate administration. These people have hitherto been unequally yoked with the Bengalis and have never, therefore, had a fair opportunity for development. The cry of 'Behar for the Beharis' has frequently been raised in connection with the conferment of appointments, an excessive number of offices in Behar having been held by Bengalis. The Beharis are a sturdy loyal people, and it is a matter of common knowledge that although they have long desired separation from Bengal, they refrained at the time of the partition from asking for it, because they did not wish to join the Bengalis in opposition to Government. There has, moreover, been a very marked awakening in Behar in recent years and a strong belief has grown up among Beharis that Behar will never develop until it is dissociated from Bengal. That belief will, unless a remedy be found, give rise to agitation in the near future, and the present is an admirable opportunity to carry out on our own initiative a thoroughly sound and much-desired change. The Orissas, like the Beharis, have little in common with the Bengalis, and we propose to leave Orissa (and the Sambhalpur district) with Behar and Chota Nagpur. We believe that this arrangement will well accord with popular sentiment in Orissa and will be welcome to Behar as presenting a seaboard to that province. We need hardly add that we have considered various alternatives, such as the making over of Chota Nagpur or of Orissa to the Central Provinces and the creation of a Chief Commissionerhip instead of a Lieutenant-Governorship for Behar, Chota Nagpur and Orissa, but none of them seems to deserve more than passing consideration, and we have, therefore, refrained from troubling Your Lordship with the overwhelming arguments against them. We have also purposely refrained from discussing in this dispatch questions of subsidiary importance which must demand detailed consideration when the main features of the scheme are sanctioned, and we are in a position to consult the local Government concerned.

21. We now pass on to the last proposal, *viz.*, to restore the Chief Commissionerhip of Assam. This would be merely a reversion to the policy advocated by Sir John Lawrence in 1867. This part of India is still in a backward condition and more fit for administration by a Chief Commissioner than a more highly developed form of government, and we may notice that this was the view which prevailed in 1896-1897, when the question of transferring the Chittagong Division and the Dacca and Mymensingh districts to Assam was first discussed. Events of the past 12 months on the frontiers of Assam and Burma have clearly shown the necessity of having the north-east frontier like the north-west frontier, more directly under the control of the Government of India and removed from that of the local Government. We may add that we do not anticipate that any opposition will be raised to this proposal, which moreover, forms an essential part of our scheme.

22. We will now give a rough indication of the cost of the scheme. No attempt at accuracy is possible,

because we have purposely avoided making enquiries, as they would be likely to result in the premature disclosure of our proposals. The cost of the transfer to Delhi would be considerable. We cannot conceive however, that a larger sum than four million sterling would be necessary, and within that figure probably could be found the three years' interest on capital which would have to be paid till the necessary works and buildings were completed. We might find it necessary to issue a 'City of Delhi' gold loan at 3½ per cent. guaranteed by the Government of India, the interest, or the larger part of the interest, on this loan being eventually obtainable from rents and taxes. In connection with a general enhancement of land values, which would ensue at Delhi as a result of the transfer, we should endeavour to secure some part of the increment value, which at Calcutta has gone into the pockets of the landlords. Other assets which would form a set-off to the expenditure would be the great rise of Government land at Delhi and its neighbourhood, and a considerable amount which would be realised on the sale of Government land and buildings no longer required at Calcutta. The proximity of Delhi to Simla would also have the effect of reducing the current expenditure involved in the annual move to and from Simla. The actual railway journey from Calcutta to Simla takes 42 hours, while Delhi can be reached from Simla in 14 hours. Further, inasmuch as the Government of India would be able to stay longer in Delhi than in Calcutta, the cost on account of hill allowances would be reduced. We should also add that many of the works now in progress at Delhi in connection with the construction of roads and railways and the provision of electricity and water for the Durbar, and upon which considerable expenditure has been incurred, will be of appreciable value to the Government of India as permanent works when the transfer is made.

23. As regards the remaining proposals, the recurring expenditure will be that involved in the creation of a Governorship for Bengal and a Chief Commissionership for Assam. The pay and allowances, taken together, of the Lieutenant-Governor of Bengal already exceed the pay of a Governor of Madras or Bombay, and the increase in expenditure, when a Governor is appointed, would not, we think, be much beyond that required for the support of a body guard and a band. Considerable initial expenditure would be required in connection with the acquisition of land and the construction of buildings for the new capital of Behar, and judging from the experience gained in connection with Dacca, we may assume that this will amount to about 50 or 60 lakhs. Some further initial expenditure would be necessary in connection with the summer headquarters, wherever these may be fixed.

24. Before concluding this despatch we venture to say a few words as regards the need for a very early decision on the proposals we have put forward for Your Lordship's consideration. It is manifest that, if the transfer of the capital is to be given effect to, the question becomes more difficult the longer that it remains unsolved. The experience of the last two sessions has shown that the present Council Chamber in Government House, Calcutta, fails totally to meet the needs of the enlarged Imperial Legislative Council and the proposal to acquire a site and to construct a Council Chamber is already under discussion. Once a new Council Chamber is built, the position of Calcutta as

the Capital of India will be further strengthened and consolidated and, though we are convinced that a transfer will in any case eventually have to be made, it will then be attended by much greater difficulty and still further expense. Similarly, if some modification of the partition is, as we believe, desirable, the sooner it is effected the better; but we do not see how it can be safely effected with due regard for the dignity of Government as well as for the public opinion of the rest of India and more especially for Mahomedan sentiment, except as part of the larger scheme we have outlined. In the event of these far-reaching proposals being sanctioned by His Majesty's Government, as we trust may be the case, we are of opinion that the presence of His Majesty the King-Emperor at Delhi would offer an unique opportunity for a pronouncement of one of the most weighty decisions ever taken since the establishment of British rule in India. The other two proposals embodied in our scheme are not of such great urgency but are consequently essential and in themselves of great importance. Half measures will be of no avail, and whatever is to be done should be done so as to make a final settlement and to satisfy the claims of all concerned. The scheme which we have ventured to commend to Your Lordship's favourable consideration is not put forward with any spirit of opportunism, but in the belief that action on the lines proposed will be a bold stroke of statesmanship which would give unprecedented satisfaction and will for ever associate so unique an event as the visit of the reigning Sovereign to his Indian dominions with a new era in the history of India.

25. Should the above scheme meet with the approval of Your Lordship and His Majesty's Government, we would propose that the King-Emperor should announce at the Durbar the transfer of the capital from Calcutta to Delhi and simultaneously and as a consequence of that transfer the creation at an early date of a Governorship in Council for Bengal and of a new Lieutenant-Governorship in Council for Behar, Chota Nagpur and Orissa, with such administrative changes and redistribution of boundaries as the Governor-General in Council would in due course determine with a view to removing any legitimate causes for dissatisfaction arising out of the partition of 1905. The formula of such a pronouncement could be defined after general sanction had been given to the scheme. This sanction we have now the honour to solicit from Your Lordship.

We should thus be able after the Durbar to discuss in detail with local and other authorities the best method of carrying out a modification of the partition of Bengal on such broad and comprehensive lines as to form a settlement that shall be final, and satisfactory to all.

We have the honour, to be, My Lord Marquess, Your Lordship's most obedient, and humble servants,

LORD CREWE'S REPLY.

India Office, London, 1st November, 1911.
To His Excellency the Right Hon. the Governor-General of India-in-Council.

My Lord,

I have received your Excellency's dispatch dated the 24th of August last, and issued in the Home Department and I have considered it in Council with the attention due to the importance of its subject.

1. In the first place, you propose to transfer from Calcutta to Delhi the seat of the Government of India, a momentous change which, in your opinion, can be advocated on its intrinsic merits and apart from the considerations which are discussed in the later passages of your dispatch. You point out with truth that many of the circumstances which explain the selection of Fort William in the second half of the eighteenth century as the headquarters of the East India Company cannot now be adduced as arguments for the permanent retention of Calcutta as the capital of British India, while certain new conditions and developments seem to point positively towards the removal of the Central Government to another position. Such a suggestion is in itself not entirely novel, since it has often been asked whether the inconvenience and cost of an annual migration to the hills could not be avoided by founding a new official capital at some place in which Europeans could reside healthfully and work efficiently throughout the whole year. You regard any such solution as impracticable, in my judgment rightly, and you proceed to describe in favourable terms the purely material claims of Delhi for approval as the new centre of Government. There should be no doubt advantage both in a longer sojourn at the capital than is at present advisable and in the shorter journey to and from thence, when the yearly transfer has to be made, while weight may properly be attached to the central situation of Delhi and to its fortunate position as a great railway junction. As you point out, these facts of themselves ensure not a few administrative advantages, and I am not disposed to attach serious importance to the removal of the Department of Commerce and Industry from a busy centre like Calcutta, for any official disadvantage due to this cause should be counterbalanced by the gain of a wider outlook upon the commercial activities of India as a whole.

2. From the historical standpoint, to which you justly draw attention, impressive reasons in support of the transfer cannot less easily be advanced. Not only do the ancient walls of Delhi enshrine an imperial tradition comparable with that of Constantinople or with that of Rome itself, but the near neighbourhood of the existing city formed the theatre for some most notable scenes in the old time drama of Hindu history celebrated in the vast treasure-house of national epic verse. To the races of India, for whom the legends and records of the past are charged with so intense a meaning, this resumption by the paramount power of the venerable seat of empire should at once ensure the continuity and promise the permanency of British sovereign rule over the length and breadth of the country. Historical reasons will thus prove to be political reasons of deep importance and of real value in favour of the change. I share, too, your belief that the Ruling Chiefs as a body will favour the policy and give to it their hearty adhesion.

3. But, however solid may be the material advantages which you enumerate, and however warm the anticipated response from Indian sentiment, it may be questioned whether we should venture to contemplate so abrupt a departure from the traditions of British

Government and so complete a dislocation of settled official habits, if we were able to regard with absolute satisfaction the position as it exists at Calcutta.

4. Your Excellency is not unaware that for some time past I have appreciated the special difficulties arising from the collocation of the Government of India and the Government of Bengal in the same headquarters. The arrangement, as you frankly describe it, is a bad one for both Governments, and the Viceroy for the time being is inevitably faced by this dilemma, that either he must become Governor-in-Chief of Bengal in a unique sense, or he must consent to be saddled by public opinion, both in India and at home, with direct liability for acts of administration or policy over which he only exercises in fact the general control of a supreme Government. The local Government, on the other hand, necessarily suffers from losing some part of the sense of responsibility rightly attaching to it as to other similar administrations. It involves no imputation either upon Your Excellency's Government, or upon the distinguished public servants who have carried on the Government of Bengal, to pronounce the system radically an unsound one.

5. It might, indeed, have been thought possible to correct this anomaly with less disturbance of present conditions, by retaining Calcutta as the central seat of Government, under the immediate control of the Viceroy, and transferring the Government of Bengal elsewhere. But two considerations appear to forbid the adoption of such a course. In the first place, it is doubtful whether the arbitrary creation of an artificial boundary could in practice cause Calcutta, so long the capital of Western Bengal, to cease altogether to be a Bengali city in the fullest sense. Again, the experiment of turning the second city of the British Empire into an Imperial residence would be certain to cast a new and altogether undue burden upon the shoulders of the Governor-General, however freely the actual work of administration might be delegated to subordinate officials. It is true that Washington, during the century since it became the capital of the United States, has grown into a large and wealthy city, with industries on a considerable scale, but even now it possesses less than a third of the population of Calcutta, while Ottawa and the new Australian foundation of Yass-Casberra are likely to continue mainly as political capitals. Such a solution may therefore be dismissed, while no parallel difficulties need be dreaded if Delhi and its surroundings are placed directly under the Government of India.

6. I am glad to observe that you have not underrated the objections to the transfer which are likely to be entertained in some quarters. The compensation which will be offered to Bengali sentiment by other of your inter-dependent proposals is, in my opinion, fully adequate, and I do not think it necessary to dwell further on this aspect of the change. But it cannot be supposed that the European community of Calcutta, particularly the commercial section, can regard it without some feelings of chagrin and disappointment in their capacity as citizens. But you may rely, I am certain, upon their wider patriotism and upon their willingness to subordinate local and personal considerations to those which concern the general good of India. Nor are the effects of the change likely to be seriously untoward consequences. The city will remain the seat of a most prominent and influential Government. I see no reason why it should suffer in

material prosperity, retaining as it will, not merely an almost universal commerce, but the practical monopoly in more than one branch of trade. And from the standpoint of sentiment, nothing can ever deprive Calcutta of her association with a century and a half of British Government, signalled by many great events, and adorned by the famous roll of those who have preceded your Excellency in the office of Governor-General. Such a history is a perpetual possession, and it will guide the steps of all travellers to Calcutta not less certainly than has the presence of the Supreme Government in the past.

8. In view of this change it is your desire that a Governorship in Council should be constituted for Bengal. You remind me that the possibility of such a creation was fully discussed in the years 1867 and 1868, although divergent opinions were expressed by different authorities of that day, and no steps were in fact taken. One of the principal objections felt then, as now, to the proposition taken by itself, hinged on the difficulty of planting such an administration in Calcutta side by side with that of the Government of India. The criticism is valid, but it would be silenced by the transfer of the capital to Delhi. I note with general agreement your observations upon the probable appointment in ordinary circumstances of a statesman or administrator from the United Kingdom to the Governorship of Bengal, while concurring that the appointment, like the other great Governorships, would be open to members of the Indian Civil Service whenever it might be desirable to seek for an occupant among their ranks. I also share your conviction that no lower grade of administration would be held in the altered conditions to satisfy the reasonable aspirations either of Hindus or of Mahomedans for the reputation and status of Bengal among the great divisions of India.

9. In considering the area which the Governor of a new Bengal should be called upon to administer, it is not necessary to recall at length the steps which led up to the partition of the former Presidency or to engage in detailed examination of its results. It is universally admitted that up to the year 1905, the task which the Lieutenant-Governor of Bengal and his subordinates had to perform, having regard to the extent of the Presidency and its population and the difficulties of communication in many districts, was one with which no energy or capacity could completely cope. It is equally certain that the provincial centre of gravity was unduly diverted to the western portion of the area and to Calcutta itself, with the result that the Mahomedan community of Eastern Bengal were unintentionally deprived of an adequate share of consideration and attention. Such a state of affairs was not likely to agitate public opinion on this side of the water; the name of Dacca, once so familiar to British ears, had become almost unknown to them. A re-arrangement of administration at the instance of the Government of India was, therefore, almost imperative, but the plan that was ultimately adopted, while effecting some beneficial changes in Eastern Bengal and offering relief to the overladen Government, produced consequences, in relation to the Bengali population which you depict with accuracy and fairness. History teaches us that it has sometimes been found necessary to ignore local sentiment or to override racial prejudices in the interest of sound administration or in order to establish an ethical or

political principle. But even where indisputable justification can be claimed, such an exercise of authority is almost always regrettable in itself, and it will often be wise to grasp an opportunity of assuaging the resentment which has been aroused where this can be done without practical detriment to order and good government. You point out, moreover, that in this case the grievance is not only one of sentiment but that in connection with the Legislative Councils the Bengali population is subject to practical disabilities which demand and merit some redress. In your Excellency's opinion the desired object can properly be achieved by re-uniting the five Bengali-speaking divisions of the Presidency, Burdwan, Dacca, Rajshahi and Chittagong, into the new Presidency to be for the future administered by the Governor of Bengal in-Council.

10. At the same time, you lay deserved stress on the importance of giving no ground for apprehension to the Mahomedans of Eastern Bengal, lest their interests should be injuriously affected by the intended alteration. In common with others of their faith, they would presumably regard with satisfaction the re-creation of Delhi as the capital of India, but they would be primarily concerned with the local aspect of the proposals. It is evident that in delimiting the new Presidency care is needed to see that the balance of the different populations, though it could not remain throughout the entire area as it stands at present in Eastern Bengal and Assam, is not really disturbed, and as you point out, the special representation on the Legislative Councils which is enjoyed by the Mahomedans supplies them with a distinct safeguard in this respect. I attach, however, no little importance to the proposal that the Governor of Bengal should regard Dacca as his second capital with full claims on his regular attention, and his residence for an appreciable part of the year. The arrangements which have been made there for the administration of the existing Lieutenant-Governor will thus not merely be utilised, but will serve a valuable purpose which it would have been difficult to secure had the proposals, similar to those which you now make, been put forward when the whole of Bengal was undivided. In these circumstances, I consider that you are right not to make any suggestion for a Commissionership at Dacca analogous to that existing in Sind in the Presidency of Bombay.

11. Your next proposition involves the creation of a Lieutenant-Governorship in Council for Behar, Chota Nagpur and Orissa. I observe that you have considered and dismissed a number of alternative suggestions for dealing with these three important and interesting divisions. Some of these schemes, as your Excellency is aware, have at different times been the subjects of discussion when a re-arrangement of boundaries has been contemplated and I refrain from commenting on any of them at this moment, holding as I do that you have offered the plainest and most reasonable solution, if any substantial change is to be made at all. The three sub-provinces above named while differing *inter se* in some marked feature are alike loosely connected with Bengal proper, and their complete administrative severance would involve no hardship to the Presidency.

12. You describe the desire of the hardy and law-abiding inhabitants of Behar for clearer expression of their local individuality differing from the Bengalis as they largely do in origin, in language, in proclivities and

in the nature of the soil they cultivate Orissa again with its variety of races and physical conditions with its considerable seaboard invested with a peculiar sanctity of religious tradition prefers a code of land legislation founded on a system of tenure differing in the main from those both of Bengal and of the Central Provinces, and has long felt uneasiness at a possible loss of identity as a distinct community. The highlands of Chota Nagpur are less densely populated than Bengal and containing a large aboriginal element, also possess ancestral and historical claims for separate treatment in various respects. These three subdivisions with their combined population of some thirty-five millions would form a charge well within the compass of a Lieutenant-Governorship, and it may be assumed that the controlling officer would be able to bestow continuous care and attention upon each of the divisions within his area. Regarding the concluding suggestion which you put forward, that the Chief Commissionership of Assam should be revived, I attach weight to your argument that the political conditions on the north-eastern frontier of India render it desirable that like the north-west frontier, it should be the immediate concern of your Excellency's government, rather than a local Administration, and I note your belief, which I trust may prove to be well-founded, that the inhabitants of this province of first-rate importance in industry and commerce are not likely to offer any opposition to the change. On the contrary they may be disposed to welcome it, since I am confident that the Supreme Government would assiduously preserve all local interests, either material or sentimental, from any possible detriment attributable to the altered system.

13. I make no complaint of the fact that your Excellency is unable at this stage to present for sanction a close estimation of the cost which is likely to be incurred in respect of the various proposals included in your despatch either by way of initial or of recurring expenditure. You have only found it possible to name the round sum of four millions sterling which you regard as the outside figure of cost which could be incurred by the transfer to Delhi, and you indicate your opinion that this amount might be raised by a special gold loan. I agree that it was not possible for you in the special circumstances of the case to undertake the investigations which would have been necessary before you could submit even a general estimate of expenditure either at Delhi or in relation to the Governorship of Bengal, to the Lieutenant-Governorship of the new united provinces or to the Chief Commissionership of Assam. This being so, I refrain for the present from making any observations on this part of the subject, merely stating my general conviction that your Excellency is fully alive to the magnitude of the proposed operations and to the necessity for thoughtful preparations and continuous vigilance in order that the expenditure which must necessarily be so large may be conducted with no tinge of wastefulness, and as regards the particular case of Delhi, assuring you that my full sympathy will be extended to any efforts you may make to prevent the holding up against the Government of India which you may find it necessary to assume for public purposes.

14. I find myself in general agreement with your Excellency when you state that if this policy is to be approved, it is imperative to avoid delay in carrying it

into effect. You give substantial reasons for this opinion, both on administrative and economical grounds and though a number of details remain for settlement many of which must demand careful examination and consultation, while some may awaken differences of opinion, it is possible now to pronounce a definite opinion upon the broad feature of the scheme. Regarding it as a whole and appreciating the balance sought to be maintained between the different races, classes and interests likely to be affected, I cannot recall in history, nor can I picture in any portion of the civilized world as it now exists, a series of administrative changes of so wide a scope, culminating in the transfer of the main seat of Government carried out, as I believe the future will prove with so little detriment to any class of the community while satisfying the historical sense of millions, and the general work of Government and removing the deeply felt grievance of many. I therefore, give my general sanction to your proposals and I share in your belief that the transfer of the capital and the concomitant features of the scheme form a subject worthy of announcement by the King Emperor in person on the unique and eagerly anticipated occasion at Delhi.

I am commanded to inform you that at the Durbar on the 12th of December, His Imperial Majesty will be pleased to declare that Delhi will become the capital city of India, that a Governor in Council will be appointed for Bengal, a Lieutenant Governor in Council for Behar, Chota Nagpur and Orissa and a Chief Commissioner for the Province of Assam.

I have the honour to be, my Lord,
Your Lordship's most obedient and humble servant
CREWE.

ALL ABOUT DELHI

AN EXHAUSTIVE HAND-BOOK

Compiled from Authentic Sources.

With 36 illustrations.

[COMPILED FROM VARIOUS AUTHENTIC SOURCES.]

CONTENTS.—The Hindu Kings; Early Muhammadan Kings; The Mughal Emperors; Modern Delhi; Some Delhi Sights; Monuments at Delhi; The Storming of Delhi; The City Gazetteer; Lord Lytton's Durbar; Lord Curzon's Durbar; The King's Durbar of 1911.

In the preparation of this book free use has been made of Mr. Panahaw's *Delhi: Past and Present*, more especially in the compilation of its last Chapter; of Dr. Ferguson's *Eastern and Indian Architecture* in the description of its great architectural glories; of the revised *Imperial Gazetteer* for the latest statistics relating to the city; of Captain Trotter's *Archæology* for a description of the storming of Delhi; and of Mr. Reynolds-Balls *Tourist's India* for a succinct account of its far-famed Mughal Sites. Besides the standard writers on Indian History and the accounts of European and other travellers to India during the Mughal period, much interesting information has been gleaned from Mr. Abbott's *Through India with the Prince*, Mr. Percival Landon's *Under the Sun*, Mr. G. W. Steevens' *In India*, Genl. Gough's *Old Memories*, and Mr. Kerr's *From Charing Cross to Delhi*.

With thirty-six illustrations.

Price Rs. 1-8.

To Subscribers of "The Indian Review" Rs. 1-4

G. A. Natesan & Co., Sunkurama Chetty Street, Madras

The Late Hon. Mr. V. Krishnaswami Aiyar.

BY THE EDITOR.

A singularly great and useful career has come to an untimely end. In the death of the Hon'ble Mr. V. Krishnaswami Aiyar, C. S. I., which took place at Madras on the 28th of December last, not only the Presidency of Madras but the entire country has suffered an irreparable loss. It has been one of India's saddest misfortunes that some of its brightest and noblest sons have had an untimely end. We lost Ransde, Telang and a host of others in the prime of their lives. Mr. Krishnaswami too has joined the majority likewise. It is impossible, within the brief space of an editorial notice, to attempt to do anything like adequate justice to his great genius, his high character, his noble and unselfish patriotism and his many-sided public and private activities. There was no public movement which made for progress, which did not obtain his active sympathy and generous support. There was no man, woman or child who deserved help, who went to his door and came back empty-handed.

The large fortune which he earned in his profession he spent away in various charities and public causes with a lavishness which did not in the least surprise his intimate friends, for they knew full well that Mr. Krishnaswami always regarded a great portion of his earnings as a trust for the public benefit.

His high and noble purpose in life, his strong will, his iron determination and the conviction that he could do no wrong—qualities that went to make his singularly impressive, domineering personality—earned for him a large following and enabled him to carry everything before him.

As a public man, as a judge, and later on, as a member of the Executive Council, his one aim in life was to do what he thought was

just and best in the interests of his country. Once the conviction had been formed that what he was doing was right, nothing would daunt him from pursuing the course which he had determined to adopt. That was the rule of conduct which guided him not only in his public life but in his private life as well. His hatred of sham, his strong condemnation of insincerity and self-seeking, and the brusque manner in which he poured forth his views of men and movements he disapproved of, made him unpopular with a few; and yet, it must be said in truth, they were the very qualities which contributed to his greatness and endeared him to his friends and followers. It is because men of his qualities and calibre are so few and far between, that the whole Presidency, aye, the whole country, mourns for him to-day. Consumed always with a burning desire to serve his country, he lived in his short-lived life so little for himself and so largely for others. The innumerable meetings that have been held over the province to do honour to his memory, the glowing tributes paid by his colleagues on the Bench and on the Executive Council, and the successful movement among the citizens of the Madras Presidency, supported by well-known public men in other parts of the country, for erecting a statue in his honor, all constitute the fittest compliment that could be paid to the memory of one of India's noblest sons. For truly he was a man among men and in his death we have lost a priceless gem.

The following is a brief account of the career of the late Mr. V. Krishnaswami Aiyar.

Mr. Krishnaswamy Iyer, Member of the Executive Council of Madras, came of an orthodox Brahmin family of Tanjore and was born in 1863. He received his early education in St. Peter's College, Tanjore, and Government College, Kumbakonam, and completed his collegiate course in the Presidency College at Madras, when it was presided over by that eminent educationist, Mr.

Edmund Thompson He graduated in Logic and Ethics from that College in 1882, when he was 19 years of age In 1884 he took the B L degree Mr. Krishnaswami Iyer joined the Madras Bar in 1885 and before long came to the notice of Sir Subramania Iyer, K O I E, who as a lawyer with a large clientele, wanted the assistance of younger men. It is difficult to estimate the influence that that intellectual Titan brought to bear upon the plastic brains of the young who served under him This much is certain, however, that in Mr. Krishnaswami Iyer's intrepidity, readiness to retort, and vivacity we see something more than the mere traces of that great lawyer. At first, practice did not come to him quickly and, indeed, there was a time when he, much like others, thought of migrating to places where a living could be more easily made But from the time that he joined Sir Subramania Iyer, he rose to prominence. Hard work and native sagacity soon marked him out as one of the coming men at the Bar and it was not long before it made him one of the recognised leaders of the Bar in Madras

As a lawyer, Mr. Krishnaswami Iyer was distinguished by his sturdy independence of character, ready wit and a readier capacity for retort. He combined in himself, as a European member of the Bar once well-known in Southern India put it, the eloquence of Mr. Norton and the legal acumen of the late Sir V. Bhashyam Iyengar To high forensic abilities, Mr. Krishnaswami Iyer combined the skillfulness of a clever and searching cross examiner, who could make a witness unaware unravel the mystery of his own transaction. The success he scored in the Arbuthnot trial created at the time a profound impression throughout Southern India. He had besides in his professional career crossed swords with the late Sir V. Bhashyam Iyengar, Mr. Norton, Hon'ble Mr. Sivaswami Iyer, Mr. Sundara Iyer, and other well known members of the Madras

Bar, both European and Indian. For a good many years he was joint Editor of the *Madras Law Journal*, one of the best journals of its kind in all India His subsequent elevation to the Bench and his translation to the Madras Executive Council justly recognised his merits as a lawyer and citizen, and the work he had done as Judge has been commended both by professional men and by the general public

As a public man, the Hon'ble Mr. Krishnaswami Iyer shone equally well. He took during the past ten years and more a deep and abiding interest in the Congress movement It is worth recalling now that he was largely instrumental, at the Madras Congress of 1896, in getting up a Resolution in favour of adding a non-service Indian Member to the Governor's Executive Council at Madras and Bombay. In the speech he made on that occasion he described himself in no uncertain terms "I flatter myself," he said, "that I am no radical but a conservative politician," and his whole subsequent career has undoubtedly emphasised this aspect of his character. The success of the last Madras Congress, which signalled the triumph of strict constitutionalism over the baser elements that have marred Indian public life in recent times, was due to the influence, the statesmanlike grasp and the organising skill of a single person—the Hon'ble Mr. V. Krishnaswami Iyer. True it is, he was ably assisted by several well known men in the Madras Presidency but it cannot, we believe, be gainsaid, when we say that he dominated in the Congress councils of the year and coloured them with the tint of his own glasses The debating of questions of a doubtful political value was abandoned; sober opinion, mellowed in the experience of long life, took the lead with the result that the Congress did its work with the quietude and sense of responsibility that should characterise a deliberative assembly. Mr. Krishnaswami Iyer was a staunch believer in strictly constitu-

THE MADRAS EXECUTIVE COUNCIL.

BY THE EDITOR.

THE task of appointing a fitting successor to the late Hon. Mr. V. Krishnaswami Aiyar, in the Madras Executive Council is one beset with many difficulties. It is certainly very unfortunate that, within a few months of his arrival in Madras, and as the misfortune of Madras will have it, within a few months of his approaching departure to Calcutta to take up the new appointment of Governor of Bengal, Lord Carmichael should have had to take upon himself the responsibility of selecting the Indian member of the Executive Council. We should not have thought it worth while to refer to this subject but for the circumstance, that since the demise of the late Indian member, a deliberate attempt is being made in certain quarters by a few interested individuals to make the public and the Government believe that there is nothing obnoxious or dangerous in recruiting the members of the Executive Council from the High Court Bench. Speaking generally, we think it is not only obnoxious but it is also a most dangerous practice if often resorted to.

Once an individual attains a position as an occupant of the High Court Bench, he ought to have nothing more to look forward to the Government, is a doctrine which is universally accepted in all civilized countries where impartial administration of the law is looked upon as the cornerstone of good government. In this country where one and the same individual appears as prosecutor and judge, the appointment of the occupants of the High Court Bench to seats in Executive Councils may appear to be the natural order of things. But to those who have been accustomed to looking to the High Court as a corrective to the evils of a hopeless jumble of judicial and executive functions the

idea of the appointment of a Judge of the High Court to a place in the Executive Council will certainly be a painful shock. The men who seriously bring forward the argument that competent men are only to be found in the High Court Bench forget two things. In the first place, if their arguments are correct, then the moment you take away the competent man from the High Court, that institution becomes inefficient because, according to their argument, there are no competent men in the country to take their place. And secondly, if there are no competent men outside the High Court Bench to fill places on the Executive Council, the reform which opened the Executive Councils to Indians was premature and ought not to have been brought into force till such time as the country was ripe for it, and manifested the existence of a number of men who were quite competent to discharge the duties of the high office of a member of the Executive Council.

There is no necessity for us to further elaborate the point. Even the advocates of the policy of the appointment of High Court Judges to places on the Executive Council admit that that policy is bad on principle. If a policy is bad on principle its adoption in any specific case can only be justified in exceptional circumstances. And it is because, we firmly believe, that, at present, there are no exceptional circumstances to warrant a departure from a wholesome principle and that there are outside the High Court Bench some very capable men of character and ability, who are reputed for their sense of justice and impartiality and have never been accused by members of any of the different communities in Madras of intolerance and strong prejudices—we feel it our duty to enter our emphatic protest against selecting a Judge of the High Court to the vacancy in the Executive Council.

DIARY OF THE MONTH.

January 1. The King's approval of the title of "Honourable" for Chief Justices and Judges of the Supreme Courts of the Australian Colonies, New Zealand, South Africa and Newfoundland during their tenure of office is published in the *London Gazette*.

Similar recognition will be accorded to retired Chief Justices and Judges of the above Courts, who will be permitted after retirement to bear the title of "Honourable."

The annual State Dinner took place at Government House to-night at Calcutta.

January 2. The King-Emperor held a Levee to-night at Government House, Calcutta, when about 1,000 presentations were made.

January 3. The Turkish Ministry has practically been re-constituted on the lines of the Committee of Union and Progress.

The Ulster Unionist Council issued a Manifesto to-night, stating that a provisional Government will be constituted for Ulster in the event of Home Rule being introduced, and that extreme measures will be resorted to in defence of the Ulster loyalists.

January 4. Their Imperial Majesties held a Court at Government House to-night, the function being a most brilliant one. The procedure was very similar to that of the Viceregal Drawing Room, and being the first function of the kind held by Royalty in Calcutta was very largely attended, the honour of being presented being very much appreciated, since presentation here is equivalent to presentation at the Court of St. James.

January 5. The King-Emperor and Queen-Emress to-night honoured with their presence a dance given by the Governor-General and Lady Hardinge at Government House.

January 6. His Imperial Majesty received to-day an Address of Welcome from the Calcutta University, at Government House.

January 7. The Queen-Emress visited several hospitals to-day.

Her Imperial Majesty has graciously decided that the sums of Rs. 50,000 sent to her for charity by Rajah Bahadur Ramranjan Chuckerbarty of Sitarampur, and Rs. 20,000 obtained by the Bengal Government from the rent of the Stands on the Maidan shall be distributed amongst the hospitals of all denominations in Bengal.

January 8. Their Imperial Majesties left Calcutta this morning, amidst universal and sincere good wishes.

January 9. Nagpur had to-day the unique honour of a visit from Their Imperial Majesties.

January 10. Their Imperial Majesties arrived to-day at Bombay from Calcutta. Exactly at 12.30 Their Majesties arrived at the Appollo Bunder, where the Legislative Council's Address was presented.

At sunset, the *Medina*, with Their Imperial Majesties on board, escorted by the cruisers *Cochrane*, *Argyll*, *Natal* and *Defence*, steamed out of the Harbour, and with the last booms of the rolling salute concluded India's farewell to her Sovereign.

The first Meeting of the Supreme Legislative Council was held this morning at Government House, Calcutta.

January 11. The French Cabinet has resigned.

January 12. Md. Schuster has left for Persia.

January 13. Dr. Sun-yat sen, in the capacity of President of the Republic, to-day inspected the warships at Nanking and steamed between the lines of eight beflagged warships. The banks of the river were crowded.

The British, German and American ships did not acknowledge the salute of the President's yacht.

The Hon'ble Sir John Jenkins, K.C.S.I., Home Member of the Executive Council of the Governor-General, died at 7-25 p.m. to day of hæmorrhage of the brain following upon a sharp attack of fever.

January 14. There has been great agitation in Spain recently on behalf of a striker condemned to death by Court-Martial, as a result of a riot in which a Magistrate and his two Secretaries were killed. The Cabinet was obdurate. King Alphonso, however, also expressing his desire to commute the sentence, the Cabinet submitted the necessary decree to His Majesty and simultaneously resigned.

The King signed the decree and is now urging the Cabinet to remain in office.

Crowds yesterday surrounded the Palace and cheered the King.

January 15. The death is announced of Lord Wenlock.

January 16. A Public Meeting in connection with Mr. Krishnaswamy Aiyer's Memorial was held at the Banqueting Hall, Madras, His Excellency the Governor presiding.

The death is announced of Mr. Labouchere at Florence.

January 17. A Town Meeting in support of the Hindu University scheme was held this evening. H. H. the Maharaja of Bikanir presided.

January 18. The India Office has to-day replied to the Representations of the London Moslem League with regard to Persia.

January 19. The Eleventh Tanjong Theosophical Conference was held this morning at Shiyali.

January 20. The Italian Government has ordered the release of the French steamer *Carthage* on receiving satisfactory assurances from France.

January 21. The *Medina* with the King and Queen on board arrived at Port Said.

January 22. The Duke and Duchess of Connaught arrived at New York to day.

January 23. Italy has notified the Powers that she has established an effective blockade of the Ottoman coast in the Red Sea between the latitudes 15 degrees 11 minutes, and 14 degrees 30 minutes.

Further, that vessels attempting to evade the blockade will be dealt with in conformity with *International Law and treaties*.

The Moslem League has collected mainly from India the sum of £2,400 sterling for the Red Crescent Fund.

Two doctors, a dresser, a dispenser, and two male nurses are being sent to Tripoli almost immediately, with equipment, as a small field hospital for the relief of the sick and wounded Ottoman combatants.

January 24. The Opium Conference has come to an end to-day at Hague. The Plenipotentiaries of twelve Powers have signed the Convention, which contains 25 Articles.

January 25. A preliminary Meeting of the forthcoming All-Bengal Hindu Educational Conference was held this afternoon at Calcutta, Mr. Suvendra Nath Banerjee presided. It was decided to hold the first session of the Conference at Calcutta on the 25th February next. An Executive Committee was formed to settle the details of the Conference.

January 26. The Duke of Connaught to-day visited the National Press Club, at Washington where His Royal Highness delivered the first speech of his visit. He said he hoped President Wilson would use their power for the good of the world, and trusted that Great Britain and the United States would always be the best of friends. The Duke received an uproarious ovation.

January 27. The Duke and Duchess of Connaught and Princess Patricia have left New York on their return to Ottawa.

Current Events.

BY RAJDUARI.

THE REVOLUTION IN CHINA.

IN the world of politics Chinese affairs have during the month occupied the largest attention. When the revolution for a change of Government broke out, it seemed like a speck on the azure horizon of the East. It was thought that the speck would disappear and things will go on pretty much the same as before. But that surmise has proved altogether incorrect. The speck soon changed into an extensively clouded sky threatening serious portent, all hope of the revolution turning out of a bloodless character, as was the case on the banks of the Bosphorus under the lead of the patriotic Committee of Union and Progress, had to be abandoned. As weeks progressed fire and brimstone and not a little bloodshed became quite conspicuous in the struggles for a really constitutional Government on a democratic basis. Whatever may have been the pacific intentions of the party of revolution, the resistance offered by the supporters of the effete Imperial dynasty, tottering on the throne for at least half a century past, left no alternative but to meet resistance by resistance. The celestials of the royal house were hardly strong enough to overcome the struggle and began paltering for a truce which they fondly imagined might save the dynasty from annihilation. But they counted without their host who, like the *Covenanters*, stood firm, born, as it were, to win, come what may. The royal party knew little or next to nothing of the real force and motive which actuated the reformers. It knew nothing of the strength they possessed and of the whole-hearted support they had derived from the disaffected troops. No wonder that the Imperial coterie has all through been defeated, both in diplomatic negotiations and in civic war-

fare. More. The celestials had been perforce obliged to issue edicts after edicts of a most humiliating character to conciliate the growing forces of Republican Government and save the dynasty by hook or by crook. But all these were vain efforts. The Manchus are doomed. Not even the trusty Yuan-Shi-Kai can, with all his diplomacy, his statesmanship and his patriotism, swerve the revolutionaries from their determination to substitute a democratic Government for the corrupt and effete one which had so long tyrannised over the country. Dr. Sun Yat Sen is indeed a leader of great intelligence and enlightenment whose stay in Europe and the Farthest West has fully encouraged him to overturn the present Government and establish in its place another which would heartily commend itself to all classes of the people. He may not have the military strategy of *Ever Bey*, He may not have the nerve of Gambetta or the sturdy spirit of Garibaldi to rouse the people to boiling activity. All the same, he is a man who could lead with calmness, patience, and gifted with a certain statesmanship born of undying determination and deep and abiding faith in the future destiny of his country. Such a leader is destined in a country like China to succeed. And so far he may be said to have fairly succeeded. He has been popularly acclaimed the First Provisional President of the Republic. But, of course, it is too early to say whether the Republic will last. For the time being the Imperial party, with the infant Emperor, have fled to a safe haven of rest, while the few loyal troops are engaging themselves in a hopelessly sanguinary struggle with the Republicans. All north China is in a blaze, and though southern China is said to be monarchical and still clinging to the old Government, it is only a question of time when it comes in a line with the rest. Of course, meanwhile the representatives of the foreign Governments are playing a waiting game. They

have at least every confidence in the proclamation of the Republican leader that he will be good to his word and in no way molest the foreigners or do any injury whatsoever to their material interests. This, of course, must be expected from an enlightened son of China who has long stayed in the West and is thoroughly alive to the fact of the foreigners being vastly helpful to the prosperity of China. A few weeks more and the ultimate fate of the country will be determined. It is growing more and more doubtful whether Yuan-Shi-Kai will ever succeed in what looks like a hopeless attempt to institute a limited monarchy with a *roi fainéant* of the old and hated dynasty. The war cry is "Down with the Manchu! China for the Chinese." The Manchu must be driven out bag and baggage from the country. Dr. Sun-Yat Sen is strongly of opinion that under no circumstances there should be any restoration of the dynasty. The Manchu at no price is wanted in China. When that is the feeling, which also permeates in the vein of every Chinese, the efforts of Yuan-Shi-Kai are doomed to disappointment. It may, however, be that a civil war or struggle may yet ensue in which the embattled hosts will be arrayed on the two sides, one for a limited monarchy and the other for a pure republican government which shall rule free of every kind of dynastic arrangements. But the end of such a war can be easily foreseen. Events lead us to the opinion that the ferment among the people is so great for a republic that that form of Government will eventually be established and Dr. Sun-Yat Sen is the only capable man to steer the helm as its first President. And when he is recognised by the Foreign Powers, the new evolution of China will go on its destined course. Meanwhile it may be interesting to quote here an extract from the *Manchester Guardian* (1st January) on the ability, character, and genius of the Provisional President of the Republic. "From his exile Sun

Yat-Sen must have been moulding events, must have made his genius felt paramountly and decisively; his instant election proves that. It is difficult for Western people to gauge and understand Oriental personality, and no Chinaman except the late Li Huang Chang has been at all clearly conceived by Europe. What is it in the reformer, that with his differences from the ordinary Chinaman—his Christianity—his alien culture drawn from England, America and Japan, his long absence from his native country—gives him his influence over his native countrymen? We cannot tell. We know that the Manchus have feared him for long, that a price of £100,000 was on his head, that he was incredibly kidnapped into the Chinese Embassy in London, and that he has fitted from country to country, apparently inspiring and directing other exiled reformers. But we are only at the beginning of our knowledge of him, he is just emerging as one of the great contemporary figures. Only it is already clear that in the course of this new year, when the new destiny of China is being settled, his is to be a controlling hand." All Eastern nationalities should wish him success as the First President of the Republic.

PERSIA AND RUSSIAN DOMINATION.

Affairs in Persia are no better or worse than they were four weeks ago. True it is that the Mejlis had involuntarily to part with their most accomplished and stern Treasurer-General, Mr. Shuster has had to go; but we may be quite sure that we have not heard the last of him. We may soon learn from New York something even more startling about Muscovite chicanery and subterranean intrigues than that were disclosed in that trenchant letter which exposed the discreditable doings of that Power. The further revelations which he may make will no doubt convince the world of honesty, what kind of a Power is the Russian with whom an *entente cordiale* has been maintained by Great Britain. Mean-

while America is sulky and there need be no surprise if a bombshell, in an economic way, is thrown from Washington into the Russian Camp. On all hands it is now admitted that Sir Edward Grey's policy towards Persia is not only a dismal failure but fraught with the most momentous consequences in the immediate future. He has made himself an "impossible Foreign minister" and in all probability he will have soon to move out from the Foreign Office. English opinion is being fast educated and informed on the true condition of Persia and the strings which Russia is pulling from behind to force the partition of Persia. The prolonged occupation of Tabriz by Russian troops is a great menace to Tehran. For, in reality, looking from the point of military strategy, Tabriz is Tehran. To occupy the former is equivalent to being the master of the latter. On all hands it is acknowledged that the British Government made the gravest error in sending Indian troops in Southern Persia where Russia by her secret emissaries had been fomenting all kinds of troubles. The importation of troops there has given that very opportunity to have troops at Tabriz which Russia wanted. In his most excellent review and forecast of Persian affairs at Edinburgh, the other day, Lord Lamington conclusively showed what active and independent action of a rigorous character was now essential for Great Britain to take in Persia. The Indian Government itself is alarmed at the new and dangerous agreement which Sir Edward Grey has made with Russia to have a railway from Baku, via Astrabad, to Nushki and Karachi. The inner significance and danger of it cannot be exaggerated. It is bound in certain eventualities to be the means of an invasion by the Northern Colossus. Practically the projected railway threatens both India and Afghanistan. The Ruler of the latter is already alarmed and is courageously trying to shut all doors against the coming hereditary foe. It was loudly alleged that

the one aim and object of the Anglo Russian Convention was to prevent a partition of Persia; but, as a matter of fact, it is clear now that the Convention is used by Russia as an instrument wherewith to bring about the very object which it was declared to avert. The agreement threatens to bring a break down and with it, it is to be feared, Anglo Russian hostility of a most bitter, perhaps, bloody character is bound to ensue sooner or later. The only wise statesmanship is for Britain to withdraw Indian troops at once from Southern Persia and to force Russia to withdraw hers from Tabriz and other places. The indigenous Government at Tehran must be supported, so that it may be enabled to keep order all throughout the country. Tehran has never been allowed that opportunity. It has all along been the game of the astute Muscovite never to allow it. What the intentions of Russia are can now be seen through and through. She wants to bring into contempt the Government at Tehran; and by means the most Machiavellian to bring back that contemptible creature, the deposed ex-Shah, on the throne, under the pretext that his reign alone can bring back security to Persia. Practically, if this dread contingency becomes an accomplished fact it would mean that the ex-Shah will be only a *roi faineant*, a mere puppet, whose strings will be pulled from St. Petersburg. What the consequences of such an event will be need not be related. He who runs may read. There must be a war to the knife between England and Russia the end of which no person can predict with certainty. The sooner Sir Edward Grey is removed from the Foreign Office the greater the safety and honour of Great Britain. As things are, he seems to have sold Great Britain to Russia!

TURKEY.

In the near East, too, affairs seem to be as dismal as they possibly could be. Turkey at present is enveloped on all sides by combustibles

A Thackeray Year-Book *Compiled by Helen & Lucius Melville. George G. Harrap & Co., London. 1911, 2/6 Net.*

We cannot imagine a more delightful present for Christmas, for the New Year or for a birth-day than a Year-Book of Thackeray, such as is here presented. Thackeray has been supposed by those who read him cursorily or forget more than half of that which they read to be a cynic seeing nothing but the faults and frailties of human nature. To such persons the extracts from Thackeray here presented would be a liberal education. Thackeray was in reality the most generous and gentle of men, and his books are full of the milk of human kindness, full of warm hearted enthusiasm for the men and women around him, full of the greatness and the pathos of human life. If he scourged the mean and the cruel, it was because he realized the essential values of things and would have none of the shallow philosophy which is ready to excuse everything. And all his work, or all the best of it, fulfils the severest tests—it is a criticism of life and not a mere dexterous weaving of tales, it is filled with a sense of big issues, in fine, it is literature and not mere journalism.

The collection of extracts from Thackeray which is here presented could hardly fail to be other-wise than delightful when the rich mine from which they are derived is remembered. To say that it is perfect, or that the student of Thackeray will not miss passages that seem to him suitable for such a purpose, would be to expect the impossible, but on the whole the compilers have done their work well. Perhaps they have been a little afraid of including passages which have a particular application in the text but which, when separated, may cover the widest scope. Thus, when Harry Esmond speaking of his Mistress, says: "One may put down her words and remember them, but how describe her sweet tones, sweeter than Music," one feels

that though the original sentiment related to Lady Castlewood the thought expressed may be applied to every century and to any case. More difficult is the question of the treatment of passages such as the following from "The Newcomes"—"And the past and its dear histories, and youth and its hopes and passions, and tones and looks for ever echoing in the heart and present in the memory—these, no doubt, poor Clive saw and heard as he looked across the great gulf of time, and parting, and grief, and beheld the woman he had loved for many years." These affecting sentences we would fain have seen included in the selection, yet it is true that they are not so generalized as to form a suitable detached quotation; they depend somewhat on the story to which they belong; and so they have been excluded. Perhaps the decision is right, and however it may be, the authors of this year book have produced a very charming collection which we can heartily recommend to all who wish to give pleasure to themselves or their friends.

The Science of Wealth. *By J. A. Hobson, M.A. (Williams and Norgate, London)*

Messrs Williams and Norgate are publishing under the title of the "Home University Library of Modern Knowledge" an excellent series of small manuals dealing in a popular but thoroughly workmanlike manner with a variety of important modern problems, such as the Socialist Movement, Polar Exploration, Health and Disease, Evolution and so on. To this series, which is appearing at the modest price of one shilling, Mr. J. A. Hobson contributes a well reasoned and clearly written volume on the Science of Wealth. He here sets out the manner in which, in the modern business world, labour, land, capital, ability and Society inter-act and re-act in the production of wealth. Avoiding the hard and fast "laws" of the professed writers on Political Economy and assuming no knowledge of Economic

Indian Monetary Problems. *By Mr. S. K.*

Sarma, B. A. (Madras, Law Printing House, Mount Road.)

Mr. Sarma deserves to be congratulated on the readable hand book he has produced on a subject that is not only dry and difficult of understanding to lay-readers but also one on which Indian public opinion should without further delay be focussed, if the finances of the country should be kept stable. Mr. Sarma writes with vigour, if also at times rather a little too warmly and has laid under contribution about every report and speech of any consequence that has been issued or delivered on the subject. This is as it should be as first knowledge of the authorities is about the first qualification for attempting an adequate treatment of so vast and so important a subject as that of Indian Monetary Problems. Mr. Sarma may be right or may be wrong; but there is no mistaking what he means or what he wishes that the Government should realise and act upon. He does not believe in a gold standard for India; he does not think that it is easy to change the currency of India from silver to gold; and he thinks that India should pay heavily for the conversion of its currency from silver to gold, if its adoption is decided upon. His reading of the authorities leads him to say that Government have fallen into avoidable errors in regard to their rupee policy, and makes him plead for a return to the old "honest rupee." This last suggestion is made in the final chapter of the book, and it enshrines Mr. Sarma's constructive part. He appears to think that the opening of the mint for the free coinage of silver is practicable and even necessary and that any possible loss would be counter balanced by a 4 per cent. import duty. He also would like to see Great Britain getting the Powers to settle the question by an international agreement.

Mr. Sarma has tried to fill a gap long existing in the Indian economic field, so far at least as the

lay reader is concerned. He has done well on writing on it, a subject of pressing importance. In the years to come it is likely to attract even greater attention and in the discussions that are to follow the volume before us should prove of great use both to skilled financiers and to laymen taking an interest in the monetary problems of India.

Poems of Men and Hours. *By John Drinkwater.* (David Nutt, London, 1 sh. 6 d.)

A literary characteristic of the present day which has met with very wide recognition is the respectable level of merit maintained by even the ordinary denizen of the world of letters. Mr. Drinkwater's poems are full of sweetness and grace and are not marred by any deficiencies of technique. The poem on *Oxford* reminds us of some of the finest efforts on the subject in the English language. The author might be proud of the opening though it contains an echo of some lines of Matthew Arnold.

Far down the ghostly ages we look with friendly eyes
To the grave and gracious dreamers who fashioned
thee in dreams.
Saw thy domes and lordly turrets interwoven with the
skies,
And the pleasant silent places of thy hly-haunted streams.

A note of Hogarthian grimness is struck in *London at Night* in which the mother of cities appears like a "monster agape for the waifs of the world, the rebels of custom and time". The poems on Hardy, Swinburne, Meredith and Watson, display a fine literary sense and a single line often enables us to appreciate the essence of a poetic spirit as in this reflection on Hardy's work, "he serves us best who sings but as he sees" or in the characterisation of Swinburne's song as "majestic, bejewelled, unbroken".

THE LATE SISTER NIVEDITA.

TOPICS FROM PERIODICALS.

The Late Sister Nivedita.

Mr. S. K. Ratcliffe, late Editor, *Statesman*, Calcutta, pays a glowing tribute to the memory of the late Sister Nivedita in the December number of the *Modern Review*. The writer first made his acquaintance with the Sister at Calcutta in 1902, and the acquaintance led to a friendship, which the writer regards as the "most valuable and revealing of all personal experiences" for himself. "Her house," says the writer, "was a wonderful rendezvous. . . . Nowhere else, as far as our experience went, was there an opportunity for making an acquaintance with so many and varied types of Indian character. Here would come Members of Council and leaders in the civic affairs of Calcutta and Bengal, men whose names and doings were daily canvassed in the newspapers, Indian artists and men of letters; teachers, speakers, journalists, students; frequently a travelled member of the Order of Ramakrishna, occasionally a wandering scholar, not seldom a religious leader or public man from a far-off province." Distinguished foreigners when visiting India seemed to have visited her house, as we may learn from the reference of the writer to the visit that Mr. W. J. Bryan of America paid to her. Her gift of speech was most remarkable, but her speeches were sometimes far above the comprehension of her audience. "Always rather at the mercy of a too difficult theme, given to the use of socio-philosophic terms and a far too compressed method of exposition, she sometimes soared far above the comprehension of her audience." But the instinct of display was far removed from her "fine and nobly veracious mind." The writer's estimate of her oratorical gifts is found in the following sentence: "I have thought, and still think, that her gift of speech was something which when fully exercised I have never known surpassed

—so sure and faultless in form, so deeply impassioned; of such flashing and undaunted sincerity."

Mr. Ratcliffe concludes his tribute with a spirited protest against the remark of an Anglo-Indian daily of Calcutta, that the Sister simply "strove to play at Hinduism." He says:—

"No one who knew that splendid and dauntless spirit could ever think it worthwhile to defend the actions or the aims of Sister Nivedita against a criticism such as this, even though it followed hard upon her death and appeared in a journal to which she contributed some of the ablest examples of her journalistic writing. But it is permissible, I think, to take up the challenge contained in the word "play" upon which the writer of the passage lays emphasis. We think of her life of sustained and intense endeavour, her open-eyed and impassioned search for truth, the courage that never quailed, the noble compassionate heart. We think of her tending the victims of plague and famine, putting heart into the helpless and defeated, royally spending all the powers of a rich intelligence and an overflowing humanity in the service of those with whom she had cast her lot. And we say: If this was play, then may grace be given us all to play the game.

Mr. S. H. Swinny pays the following tribute to the late Sister Nivedita in the pages of the *Positivist Review*, London:—

Her message, enforced with eloquence and unquenchable ardour, was the development of India along Indian lines towards the triumph of the Indian national spirit. But she was no obscurantist. She recognised that in the science of the West all mankind must share. She had studied Comte and Le Play, and saw the necessity of treating Indian problems from a sociological point of view. She succeeded wonderfully in obtaining the confidence of Indians, and many an Indian youth owes to her the first impulse to a generous patriotism. But if she was an inspiration to India, she was also its interpreter to the West. She taught us in her book, "The Web of Indian Life," to recognise the beauty of the Indian home—so much maligned by Christian missionaries—and the dignity of Indian womanhood. Among her other writings, a small booklet on Indian famines is an excellent example at once of her power, her eloquence, and her insight. She was only forty-four when her strenuous and devoted life ended,

India, and the Royal House.

The *Dawn* for December contains an interesting article on the significance of the Royal Visit. The writer shows that the ties between India and the Royal House have been growing in strength and attachment during the past half a century and that the present visit is the climax of the whole story. Says the writer—

Our first Queen-Empress of beloved memory was not able to visit India in person, but her endeavour had always been to draw closer the ties between India and the Royal House, and so in obedience to her loving wishes, *our Prince* after another, first her second son, then the Heir-Apparent, and then her third son, and then her grandson, the late Duke of Clarence, came to India and conceived a loving attachment for India and Indians. Our first King-Emperor, similarly, had not only visited India as Prince of Wales but graciously also sent the Heir Apparent, now our August King-Emperor, on a Royal Tour in this ancient country. From her late Majesty Queen Empress Victoria, the members of the Royal Family have learned to look upon India and her people with feelings of loving sympathy and regard.

The following passage deals on the significance of the Royal Visit—

The event will be unique in its character and will be of transcendental importance. Never before in the history of British India was there an instance of a British King or Queen visiting their Indian Territories or celebrating the auspicious and solemn event of their Coronation, in person. Hitherto the position of the connection between India and the Royal Family has been that while every member of the Royal Family including the Heir Apparent has been free to visit India, the Sovereign may not personally honour this Dependency with a visit. It must be remembered that every part of the Empire excluding the United Kingdom has been in the same position as India, so far as the visit of the Sovereign is concerned. The first Queen-Empress of India, Victoria the Good, had visited the Continent and the south of Europe for the benefit of her health. The first King-Emperor, His Majesty the late Edward VII also travelled in Europe either for the benefit of his health or on diplomatic Peace missions, it has hitherto been the recognised practice that beyond Europe the Sovereign might not go. That unwritten rule is now going to be departed from, and the occasion will be regarded as one of supreme value and importance. The Prince of Wales, the Heir to the Throne, may travel over the whole World, but the Sovereign must not go out to Canada, Africa, Australia, or to India. The present King Emperor accompanied by his Royal Consort had visited India and the rest of the Empire as Prince of Wales only a few years ago (*India being visited in the winter of 1901, 1902—9th November to 10th March,—and the self governing Colonies, some four years earlier in 1901*). And now His Majesty in his capacity as the Emperor of India has vouchsafed to confer a unique honour on India by undertaking a second voyage.

The Importance of Buddhism.

Mr. Albert J. Edmunds writing in the December number of the *Buddhist Review* gives the following six reasons for the study of Buddhism:—

1 At the time of the Christian era, Buddhism was the most powerful religion on the planet, and its influence was paramount over most of the continent of Asia until the rise of Islam.

2 It is a living force to-day in Ceylon, Siam and Burma, which have preserved the Pali Texts, and in Japan, which has preserved some ancient Chinese versions of lost Hindu originals. A Japanese Buddhist Bible Society is still reprinting these works, which the Chinese have not reprinted since the seventeenth century, though they did print them as early as 972 A.D., five centuries before Gutenberg. The crying need of Buddhist scholarship to-day is for young men to translate for us these six thousand volumes of texts, commentaries and patristics, which are now sealed books. The learned comparison lately made by Anesaki between the Chinese *Agamas* and the Pali *Nikayas* (*Transactions of the Asiatic Society of Japan*, 1908) gives sufficient proof of the profit and value of the Chinese literature to the field of Hinayana or primitive Buddhism alone.

3 The Japanese Buddhists have lately sent missionaries to Great Britain, Germany and the United States. In the latter country their headquarters are at San Francisco, where they publish a magazine, *The Light of Dharma*. Temples are being built in other parts of California, in Oregon and Hawaii.

4 The Philippines Islands, now under the rule of the United States, learnt the art of writing, either directly or indirectly, from the Buddhists, and the two Taga alphabets were derived from the Pali.

5 Buddhism deals with the great problem of the origin and destiny of human personality. This problem is ignored in the New Testament, or is referred to only in the language of mythology.

6 Eminent Europeans and Americans have been profoundly influenced by Hinayana thought. Schopenhauer, Emerson, Max Muller, Deussen, Wagner, and many more.

Sri Sanharacharya's Select Works.—The Text is Sanskrit, Devanagari type and an English Translation. By S. Venkataramanam, &c. Containing more than 700 verses in all and including all his important works. Bound in cloth. Price Rs 1.8. To Subscribers, Rs 1.

G. A. Natesan & Co., Sankararam Chetty Street, Madras.

The Hindu University—What it means?

Professor Benoy Kumar Sunkar in a thoughtful article contributed to the October number of the *Collegian* justifies the movement for a Hindu University. According to the writer, there can be no education worth the name unless it is related to the life and world in which the people is brought up. He writes:—

It is a truism in modern pedagogy that the education of an individual can be real and calculated to help forward his natural thought-processes and instinctive tendencies, if adapted to the world of facts and ideas in which he is brought up, and gradually leads him from the concrete and the known to the abstract and the unknown. The system of education for a people should likewise take note of and utilise the historic ideals and traditions which make up its real and concrete universe of thought and action, and adjust itself to the requirements suggested by these predisposing circumstances.

Further, Hindu culture and civilisation have developed certain special features which it is necessary to preserve and study.—

Varieties and types of national character and civilisation depend on the Religion, Literature, Philosophy, History and Science that the peoples evolve as they live and grow.... Every association of human beings, which is big enough to be called a people and which is old enough to have traditions which its members cherish and feel glory in, must, therefore, have a University of its own to direct and control its educational interests. Denominational Universities are the really national Universities of the world.

Who is there in the world to deny the separateness of Hindu Society from other societies of men? That it has certain special features which have grown and developed in mass and volume through the ages, and differentiate it from other systems of life and thought, is also beyond dispute. The University, therefore, that supplies best the needs of other peoples is certainly not the institution that can preserve and further, along lines of progress, the natural and national culture of the Hindu race. A separate University, therefore, which can focus and concentrate the forces of the Hindu world for the education of its youth becomes a desideratum.

The special features of the Hindu University are thus the preservation and promotion of the individuality and separation of Hindu life and culture. This it seeks to attain in two ways. In the first place, it gives a special importance in its curriculum to a study of (a) Hindu Religion and (b) Hindu Literature, Philosophy and History primarily and secondarily of the literature, history and philosophy of the West, according to the principles of Educational Science regarding the proper relation between indigenous and foreign cultures by

which the national systems of Education are controlled and regulated in advanced community. In the second place, it makes provision for the "modern side" of education and incorporation of the best assimilable ideals of the West with the best traditions and ideals of the Hindu by emphasising the need for scientific, commercial and technical education in its system of instruction from the elementary stage upwards.

The Hindu University thus would not only be an additional University in the Indian Educational world of to-day and add to the educational opportunities of the people, especially of those "who have not availed themselves of the facilities offered by the State," but would come in to bring with it a distinctive ideal of its own viz., the educational of the Hindu youth along the lines of his own natural evolution and the furtherance of the interests of Hindu civilisation along modern lines. We are concerned not merely with the number of students receiving education or the subjects in the curriculum of studies, but altogether new view-points from which to administer the problems of education and the lines of instruction. The Hindu University, like its sister institution, the Moslem University, is thus to be a new contributor to culture and civilisation of mankind.

There is another consideration which must appeal to every Hindu whose mind has been liberalised by Western education. I speak of the service to human thought and world's culture, to the interests of Science and Philosophy that may be done by the propagation of the Sacred Books of the Hindus and the diffusion of Sanskrit learning among the various sections of the educated world.

All human sciences, philology and mythology as well as economics and politics, in short, Sociology in both its narrow and wide senses, are labouring under great limitations and evident imperfections owing to the circumscribed range of observation to which the savants of the West have for want of opportunities been compelled to confine their study. To every orthodox European scholar, philosophy as well as general civilisation began with Greece, and in text books of the history of human culture it is the precursors of Plato and Aristotle that are described as the first seers, truths and civilisers of mankind, other systems of thought and discoverers of doctrines being roughly classified as 'oriental,' pre-economic or pre-political, and hence not worth the trouble and pains of an investigator. The result has been a lamentable lack of universality and catholicity in the doctrines and theories of Western scholars, which explains the slow progress of the human, judged by the rigid test of the physical and natural sciences. The relative truths of the present day social sciences have to be revised, modified and corrected in the light of new problems that are likely to be presented by Hindu society and literature. The foundation of the comparative sciences according to a correct application of the principles of the Philosophico-Historical method which it has been the glory of the modern age to discover will "then" be laid on an adequate basis. Such is the consummation we expect by supplying fresh sociological data on which to build up real inductive generalisations through the publication and circulation of the unused literary legacies of the Hindu sages.

Education in India

The *Vedic Magazine* reproduces a letter written by Mr. Myron H. Phelps of America to the *Pioneer* dealing with the subject of Education in India. The letter contains several sound observations which all interested in education should not fail to note. Coming to India and studying the educational system, the writer has been most struck by the fact that there is no social intercourse between professors and students. He says:—

I have been astonished to find that in the schools and colleges I have visited and inquired about there seems to be almost an absence of social mingling between the Professors and the students. The class or lecture-room appointment is a matter of business which teacher and students perfunctorily discharge then quickly separate and each go their way. It has been repeatedly said to me, in substance, that the Professor regards himself as a superior order of being, to the student, that if they meet on the street the chances are that the student gets no recognition, while if he calls on a Professor he is usually not asked to be seated, but "what do you want?" It would seem from the reports which reach me as though these gentlemen were jealous of their "prestige." A notable exception, however, must be made with regard to missionary schools, in which a much more cordial and intimate association characterizes the relations between teachers and students.

In such intercourse between the Professor and pupil, there is scope for the operation of what the writer terms "the contagion of character," and the strength of America to a large degree lies in that very fact. The writer says that the West has no theory consciously held on the subject though the fact is there. In India, according to the writer, the theory has obtained from the most ancient times though the practice is not to be found in modern times. He says, "The doctrine that the spiritual nature of man can only reach mature development if vivified by a spiritual impulse derived from personal contact with the *gurus*, is as old as the traditions of Hinduism." But the saddest feature about the whole educational system in India is the neglect of indigenous culture. Here are some pregnant observations:—

Before visiting the schools of this country I expected to find in them a Hindu character, a Hindu atmosphere, something besides the dark faces of the boys to remind me that I was in India. But in this I have been disappointed. They are all, Government, Mission and Hindu alike (with a very few distinguished exceptions), pervaded and characterized by an atmosphere which I can perhaps best suggest by terming it a mild dilution of the English classics—Shakespeare, Milton, Spencer, Scott, Dryden, Charles Lamb, Kingsley, and the other great English authors. One looks in vain for even a Hindu motto on the walls, for a tale from the Mahabharata or Ramayana in the books. One would think that the desire was to make Indians into Englishmen. One sees these poor boys spending a great part of their time in a desperate and, I should judge, bootless struggle to understand strange idioms and allusions, based on the social customs of a distant land of which they are as innocent as the unborn babe. Think of an Indian boy face to face, for instance, with Shelley's 'Adonais'! How many even of your University Examiners could have passed their own examinations before they worked the subject up to prepare their papers? Not understanding the text, students are forced to memorize, and so education degenerates into mere memory training and cram.

How much is the neglect of the vernacular responsible for? The writer says,—

It means to the man himself whose education is thus neglected, that he is cut off from the wealth of literature, the inspiring ideals, stored in that tongue as in a treasure-house, and which should be to him all his life a source of strength, of comfort in hardship, of guidance in difficulty—a loss which can be compensated by no foreign importation. And when his religion is embedded in that literature, as is the case with the religion of all the Hindu peoples of this country, it may very likely mean that the religion is lost with the language and character with the religion.

The religion of the people is embedded in the vernacular, and religion, according to the writer, counts for infinitely more in India than in the West. Here are his words.—

The vitality of the religion of India—I say religion admittedly, because in essentials there is practically but one indigenous religion in India—is a force of which one who understands only the West can form no conception. It is a force which when aroused will sweep all before it. It can be guided, developed, made a powerful ally; but it cannot be successfully opposed. No greater mistake could be made than to gauge this force by that of religion in the West. Christianity is no longer an aggressive or a vital power. It has ceased to be so because its leaders long since lost touch with spiritual realities, and forgot the true meaning of its Scriptures. It is an empty shell, held in position by social conventions and diplomatic formalities.

The revival of the ancient culture, concludes the writer, is the most pressing need of India at present.

European State-Morality.

A writer in the December number of that brilliant monthly, the *Dawn*, takes the war between Italy and Turkey as a peg on which to hang a powerful sermon on some aspects of European state-morality.

The motive-power behind the policy of European Nation-States is State-efficiency, and wars are regarded as good or bad, not according as they further righteousness, but as they contribute to the *realisation of efficiency*. Expediency, not morality, therefore, is the touchstone of European policy. A war may be as unrighteous as it may, but if it holds out no prospect of disturbing the existing balance of power, the conscience of Europe is pacified. But if a war threatens to disturb this balance of power then the Powers think it their duty to interfere, though the interference may be doubtful morality. Such is the gist of the article under consideration. In the following passage quoted by the writer from the *Statesman* of fifteen years ago, we are afforded some glimpse of the tendencies of Europe at the present day —

After nineteen centuries of the teachings of Christianity, the foremost nations of the world who profess its tenets are more fiercely engaged in preparations for war than in the days when temples were raised in honour of Mars, and Bellona had her devotees. To whatever quarter of Europe we turn we see the same spectacle of an armed camp. Nations arm to the teeth stand on guard to meet or anticipate the shrill trumpet blast that will usher in the Armageddon of to-day. Since the rise of Imperial Germany upon the ruins of Imperial France we have entered upon a cycle of vast armies and gigantic military budgets, such as the world had never seen before. The swarms which Hannibal led across the Alps to Cannæ's fateful field hardly muster more than a single European nation now puts in the field for powerful manoeuvres. Even the mighty host which Xerxes threw across the Hellespont to sack the West cannot match one-tenth of the prodigious levies which three great modern Powers can place in battle-array. When the wires vibrate to a declaration of war, France, Germany and Russia will reach to the tramp of twelve million armed men. The military budgets of the chief European States have grown in less than twenty years by nearly fifty per cent and the bulk of the expenditure has been devoted to the drilling of yet vaster hordes of soldiers and to the invention of yet more fearful engines for destroying man. Since Sedan, only yesterday as it seems, France alone has spent full eight-hundred million sterling in preparation for the next war that will square her

account with Germany. A statistician not long ago made the remarkable calculation that the half-dozen Christian nations of the world spend annually, in times of peace, about five hundred million sterling in preparations for war. How long will it last? The signs of the times point to the day of reckoning, the hour when outstanding differences between the nations of the earth will be settled by the sword, to close the era that makes the burdens of peace heavier than those of war.

Is there any check on the ambitions of Nation-States? Says the writer:—

There is no check upon the unfettered ambitions of the Nation-States except the fear that a wanton pursuit of international ambitions might involve the Powers in complications among themselves endangering their general liberties,—a circumstance described in the language of European diplomacy as "a menace to Peace." Therefore, the point of view from which the European Nation-States look at questions of international conduct is whether or how far any act or acts of any given state or combination of states are or may be construed as a menace to such liberties (and so represented as a menace to Peace); and not primarily whether such conduct is wrong, unlawful, or subversive of the fundamental principles of morality.

The writer instances the treatment accorded to Turkey by the European Powers at various times to point his moral. The article which is a very able one and deserves to be read in its entirety thus concludes:—

Thus European Peace is wholly political in its essence and scope and is a most elusive thing turning not on the hinges of righteousness and morality, but on the ever-shifting conditions that affect the distribution of political power among the nation-States. And so having taken that most perilous step of looking to the power of State-efficiency as the one true and reliable guide and weapon in the conduct of international affairs and exalting the same above everything else, the Nation-States of Europe are continually engaged in a game of diplomacy attacking the *Problem of Political Peace* (which at bottom is the problem of *their general safety*) from the point of view wholly of the distribution of State-Power among themselves,—and with hardly any thought of setting about to devise means for the promotion among themselves of conceptions of righteousness as an important factor in the conduct of international politics. In the present era of national wars or preparation for national wars, the doctrine of 'State Efficiency' and the doctrine of the 'Relative Distribution of State-Power' have acquired a pre-eminence which was perhaps denied to the older doctrine of dynastic rights and the still older religious theories that led to the religious wars in Europe. And the consequence has been that under the *regime* of an unfettered supremacy of these doctrines, the importance of international State-morality as a factor in European State-Politics has been steadily losing ground among the political peoples of the world. Thus, we find that those who stand up for the observance of righteousness and straight conduct in international affairs are openly ridiculed as 'faddists,' 'pacifists,' 'humanitarians,' who do not understand the business of what is called "real politics."

QUESTIONS OF IMPORTANCE.

General Delegation Bill.

At the last meeting of the Viceroy's Council the Hon. Mr. Syed Ali Imam in moving that the Bill to provide for the delegation of executive powers and duties in certain cases be referred to a select committee spoke as follows:—

The Bill before the Council is, as has been pointed out in the statement of objects and reasons, a measure designed to facilitate the delegation of executive powers and duties in respect of non-controversial matters. Those who are acquainted with the work of administration are aware that a stage has been reached in the affairs of the State when some measure of decentralisation has become an imperative necessity to simplify and improve our system of Government in the direction of bringing the Executive into closer touch with local conditions. The desire to centralise authority, however small and trifling, was capable of receiving gratification at a time when the administration of the country was free from the complexity with which it is burdened now. In the last 50 years, India has taken long strides in the development of her moral and material resources. Each step has synchronised with some form of legislation as is evidenced by the ponderous bulk of her Statute-book to meet the requirements of her advancing social and political welfare. An elaborate administrative machinery has grown up and to obtain the very best results it seems to be unavoidable that within reasonable and cautious limits its action should be so regulated and adjusted as to give increased utility without impairing its efficiency. Problems of great moment are pressing themselves on the attention of the Government of India and the local Governments. The legitimate aspirations of the people to take an intelligent part in the concerns of their country rightly demand sympathetic consideration and earnest endeavour at the hands of the authorities; and to secure this it has become evident that there should be some relief at the head-quarters from the wasteful expenditure of time and energy on the exercise of petty executive powers and duties. A careful examination of these by the Royal Commission on Decentralisation has clearly demonstrated the urgency of effecting a devolution of such powers and duties on subordinate authorities. Numerous enactments dealing with multifarious details of the many branches of administration and their offshoots have from time to time laid up an accumulation of a mass of unimportant centralisation of executive authority. The sections of these enactments relating to such centralisation are a legion in themselves. And any attempt on my part to place before the Council this formidable array will be inconsequential as to realise the correct bearing of each of these would require an examination of the particular act in which they find a place. This will be a gigantic effort for our legislative assembly, even if there was a disposition to spread out the winter sessions far beyond their usual length without any appreciable break in the continuity of the sittings. When introducing this Bill my hon. colleague Sir John Jenkins depicted before

the Council the extraordinary difficulties with which the Government of Bombay and the Government of India have met in the work of collecting and scheduling together the various enactments and their sections with a view to the preparation of a general decentralisation act. But even if an extra turn of the screw be put on the patient labour of the Secretariats and a fairly comprehensive schedule be produced, the result will hardly justify such devotion from the point of view of the usefulness of the undertaking. A general decentralisation act embodying a specific amendment of every act affected would involve cumbersome legislation without any uniformity of shape, not to speak of the rigidity and incompleteness inseparable from such a questionable course. On the other hand, an attempt to inflict on the deliberations of this Council sheaves of petty amending Bills is to court not only undue delay, but, what is far more undesirable, the serious dislocation of its ordinary work of legislation. This will be particularly deplorable at the present juncture when a heavy programme of urgent legislative measures has to engage our undivided attention for some time to come. Mature and anxious consideration of the difficulties and objections that attach to our embarking on either of these two courses leaves no option but to abandon them in favour of an act of delegation to provide for the devolution of authority in certain cases with proper safeguards and under effective control.

The Bill before the Council gives prominence to the two principles that underlie its inception. On the one hand, it provides to cover a wide area for the application of its provisions, and on the other, it jealously restricts its operation to cases, for the disposal of which administrative convenience is effected without in the slightest degree endangering the liberty or the rights of the subject. The exclusion of the two Codes of Criminal and Civil Procedure and of any enactments relating to the constitution of the civil courts from the purview of the Bill is in itself sufficient to remove an apprehension of the improper use of the powers conferred by the proposed legislation.

A further exclusion is contained in clause (b) of section 4 of the Bill. It relates to cases of previous sanctions or consent by a superior authority to the exercise of power under any enactment by an inferior authority given for administrative purposes. This provision narrows down the scope of the Bill considerably, but regard for the principle of duality of control is the justification for its insertion in the Bill. It will be observed that these two exclusions are so far-reaching that it will be hard to find any matter of a truly controversial character in respect of which it is possible to make a delegation of power under this Bill in favour of a subordinate authority. Within the narrow limits of the scope of this Bill additional precautions have been taken by subjecting the powers of delegation to the conditions laid down in the various sub-clauses of section 5. These are intended to ensure publicity and invite criticism before a single devolution of power can be given effect to. I do not propose to dwell on all these conditions as they will be considered by the hon'ble members in due course. But I venture to offer a few remarks on the conditions embodied in sub-clauses 6 and 7 taken together. Those two sub-clauses mark a great departure in the relations of the Executive Government and the Legislative Councils of the country. This part of the Bill

millions from private endowments. In the Philippines there appear to be neither fees nor private endowments, and the Government contribution is about 32 millions of dollars. Working out these figures, it appears that in British India the Government expenditure is about 4 cents per inhabitant, for a population of 232 millions; while in proportion the expenditure in the Philippines is ten times as great, being 12 cents per inhabitant, for a population of 7½ millions. In the United States the expenditure per inhabitant, including the Negro population, is about 4½ dollars. As regards school attendance, it appears that the total number of children in India under instruction is between 5 and 6 millions, but only one-fourth of these are in Government schools. In the Philippines 150,000 children are under instruction in Government schools, so that if the same standard were made applicable to India, the attendance of children in Government schools should be 13 millions, instead of 1½ millions. In the case of girls, the lecturer admitted that there are peculiar difficulties in India, but he reckoned that in India only 150,000 little girls are learning to read in the public schools, compared to 171,000 in the Philippines. This output does not seem creditable to the Indian Government, especially when we consider the desire for female education so strongly expressed, on behalf of both Hindus and Mahomedans, by such representative bodies as the All-India Ladies' Conference at Allahabad, and the All-India Moslem League at Nagpur.

As an example of what may be done in India itself, the lecturer points to the State of Baroda where the expenditure is 15 cents per inhabitant, more than three times the rate in the adjacent British districts, and where the school roll amounts to 100,000 which, looking to the population of the State, is ten times the proportion of the attendance in British India.

RUPEES OR CIVILISATION?

Finally (J), as to the spirit in which the two Governments have approached the subject of popular education, the Emeritus Chancellor of the New York University, quoting from English writers, is not complimentary to the British conquerors of India. They have, he says, been governed more by the 'predatory' than the 'pedagogical' instinct, and they have shown a greater reverence for rupees than for civilisation. The original impulse towards education, such as it was, came from missionary bodies in England, not from the East India Company. 'It was not the predatory people in India who first thought of giving to the people of India any schools.'

From the above it appears that, in the eyes of an expert outside critic, Indian administrators are not entitled to take up the attitude of 'Rest and be thankful.' The question propounded at the opening of this article must regretfully be answered in the negative; for it is impossible to say that the present state of primary education in India is creditable to the administration, whether we look to the long period of British rule, or to the docility of the Indian races, or to the fact that the Indian revenues are absolutely at the disposal of the Executive Government. When the educational expenditure and the school attendance are only one-tenth of what has been achieved in so short a time by the American Government in the Philippines, it is evident that some active forward movement must be made, if we are to clear ourselves of the charge of being predatory rather than pedagogical, and of reverencing rupees more than civilisation.

THE NEED FOR A NEW DEPARTURE.

For our credit before the world, a new departure must be made. And as regards such new departure, Mr. Gokhale's Bill holds the field, as being supported by the educated classes in India, and enjoying the expressed sympathy of the Secretary of State. With the permission of the Viceroy, the Bill has been introduced in the *Viceroy's Council*; and when the second reading comes on we shall know wherein the principle of the Bill meets with disapproval; although considering its objects, and what Lord Crewe has called the 'almost extreme moderation' of its provisions, it is difficult to conjecture the grounds of opposition. Has not the spread of elementary education among the masses in India been for long the settled policy of the Imperial Government? Does not past experience in all other countries prove that effective progress cannot be made unless elementary education is free and compulsory? Can the new departure be initiated in milder form than that contemplated by the Bill, which is purely permissive and which proposes only to give power, under carefully guarded conditions, to municipalities and district boards, to make elementary education free and compulsory within their own local areas. As regards the settled policy of the Government, we have authoritative declarations of a clear kind. His Excellency Lord Hardinge, at the beginning of this year, in receiving a representative address on the subject of popular education, assured the deputation that the problem was one that the Government of India have entirely at heart; and still more recently, the Marquess of Crewe, in reply to a deputation headed by Lord Courtney in support of Mr. Gokhale's Bill, declared that he viewed the educational objects favoured by the deputation with 'unbounded sympathy.'

A STRANGE SITUATION.

The situation is thus a strange one. The people of India are hungry and thirsty for education, and irrespective of caste and creed, have voiced their desire, through their leaders, in every way that is open to them. The Secretary of State and the Viceroy of India are in accord with the people and no one can doubt that would be the verdict of the Imperial Parliament. But unfortunately there is reason to fear that the official 'Man on the spot' may interfere and obstruct.

It is hoped, however, that our Provincial administrators will pause before they take up a position between the upper and lower political mill-stones. Also there are considerations which should commend Mr. Gokhale's scheme to official favour. Is it not of good omen that the first important project of law brought forward in the new Councils by an independent Indian member is a well-considered effort to bring the people into active co-operation with the Government in a great work of social advancement? No one can doubt that, sooner or later, the Government must accept free and compulsory elementary education. Is it not praiseworthy on the part of the reformers that they are anxious to share in this duty, and are willing that upon themselves, instead of upon the Government, should fall any odium arising from compulsion and an educational rate? Again, Mr. Gokhale's scheme proposes to set municipalities and district boards to work upon the education of the masses. Is this not a graceful tribute to the official wish to draw active intelligence from political agitation to useful social work?—*India*.

UTTERANCES OF THE DAY.

The Aga Khan on Moslem Education.

The following is from a message to the Mahamadan Educational Conference held at Delhi in December last:—

MOSLEM UNIVERSITY.

I am glad to see that the great university movement has emerged from the region of doubt and difficulty, and anyhow the initial stage of our great undertaking has been entered upon. But I must plainly say that tremendous, almost superhuman, sacrifices and efforts should be made by us if we wish to make it a complete and an unqualified success. No great task has ever succeeded without great sacrifices on the part of its promoters. Our desires will be fulfilled in proportion to our sacrifices. I am glad to see that we have among us men who realise this fact, and I cordially congratulate you all on the initial success of your undertaking so ably and so tactfully engineered by my esteemed friend the Raja Sahib of Mahmudabad. I beg of you to remember and realise the fact that we must in the first place deal with the immediate and practical aspects of the question. If we fail to make the best use of the advantageous circumstances in which we now find ourselves, our efforts will come to naught. That will be a bitter disappointment to all the lovers of Islam. In the first instance, we are confronted with the financial question, and I beg of the princes and peasants and all well-wishers of Islam, who have most generously promised to contribute to the funds of the university, to be so good as to send in their subscriptions at once. There is no time to lose. Our position and our hopes are trembling in the balance. They depend upon our finances and the sacrifices we make. But I hope the whole of Islam in India will rise to the great occasion and rally round and help this great cause without any delay. The minimum sum required must be found immediately. I have faith in my co-religionists. I am sure they will not fail to make the best use of the splendid opportunities that are now within their grasp. It was with the greatest admiration that I feared of the work carried on by my friend the Raja Sahib of Mahmudabad, and the constitution committee. I need hardly say that I find myself in hearty agreement with the principle and details connected with the arrangement of the constitution. I must also fearlessly assert that according to my humble opinion we must not be unnecessarily jealous of giving a little more power of supervision to the Chancellor. For one thing that I am quite certain of is that the influence of the head of the Government of India will certainly be exercised for the improvement of the standard of education, and that is perhaps the greatest need of the university. These are the immediate questions before us. I earnestly beg of you not to let this rare occasion slip our hands but to make a firm, united and whole-hearted effort to complete this great national work. The immediate and necessary question is the *functioning of the university in its existence*; but there are great and vitally important questions which cluster round our central movement, and they deserve our careful attention. To make our system of education successful and to be attended with satisfactory

and far-reaching effects we must rest it on a solid base, so that our superstructure may not give way under the stress of higher learning. I have more than once expressed my opinion that in addition to the university we must establish first class provincial colleges to be affiliated to the great university and prepare men of learning who may by and by take rank as servants and capable teachers in the university.

PRIMARY EDUCATION.

While advocating the system of higher education I must also draw your attention to the absolute necessity of a sound system of primary education. No solid superstructure can stand safely on soft soil. In order to raise our people to their legitimate sphere of power, influence and usefulness we must have a serviceable and extended system of education for the benefit of the masses. It is the duty of the Government to supply primary education to the masses which is beyond the men and scope of voluntary efforts in any civilized country. I am glad to say that the Government have expressed themselves in favour of free primary education and are anxious to do what they can in this matter of vital importance to the ryots. I am also delighted that enlightened public opinion has so unmistakably pronounced itself in favour of compulsory universal education. Gentlemen, believe me, no country can ever flourish or make its mark as a nation as long as the principle of compulsion is absent. The colossal ignorance of the Indian masses militates against uniting them as a nation, and the ideal of a united nation is an ideal which we must constantly cherish, and keep before us making every endeavour towards its realization. It is this colossal ignorance of the masses which prevents Moslems from uniting themselves in a spiritual union and brotherhood such as must be our essential aim and ambition. I firmly believe that primary education should be free and compulsory and that it should be so devised that its benefit may extend equally to the minorities as well as the majority of the Indian communities. No system of primary education can be deemed satisfactory unless it is so carefully elaborated that the minorities receive the same benefits as the majority. I most cordially welcome the movement for the adoption of compulsion in primary education among the masses, and if it is to be efficacious as I serve the noble purpose which it is intended to do, then it must be free from all and any taint of invidious distinction between one category of poverty and another. Gentlemen, nothing would be more fatal than forcing the parents to go through an inquisition of their income, and more particularly will this be so in the case of parents belonging to the minorities and even when they were treated most justly they would constantly feel that they had not received the same benefits as others. This impression should not in each case be carried or allowed. If there is to be a limit, then let that limit be of Rs 100 per month. I think it will be disastrous to set any limit. If you fix a limit let it be only to prevent the rich from receiving free benefits, but great care should be taken to see that it is only the real well-to-do classes who are made to pay. Knowing as I do the rural population I am certain *that nothing where the poor have any right should be satisfactory*. If a liberal provision be not made in the limit of income of parents, the system would possibly be an engine of injustice and discontent. Hence the greatest possible care should be exercised in drawing the

line. Again it is equally necessary that proper safeguards are provided in regard to the teaching of their own languages to the minorities who should receive an equitable treatment in this important respect. I beg of you to realise fully that the system of primary education unless it is free and compulsory and provides a safeguard for teaching your vernacular, will injure your community more than any other. Besides such a system is doomed to be an inevitable failure. You stand to gain more by the carrying out of the principle of the Hon'ble Mr. Gokhale's Bill than any other section of the people in India, provided care is taken in the re-adjustment of the details. It is not only as a Moslem that I heartily support the movement for free and compulsory primary education. You must also remember that we are Indians and I support the movement just as well as an Indian as a Moslem from a deep conviction of its beneficent necessity.

TECHNICAL AND COMMERCIAL EDUCATION.

I have frequently emphasised the urgent need for technical and commercial education and I entertain great hopes from the university which may develop into a great centre of scientific teaching together with moral and humanitarian training. If our people take to science and scientific education in the right spirit the industrial and economic future of our community will no longer be in doubt; but everything depends upon the sacrifices we now make.

We should take a lesson from Japan. If we make such sacrifices as Japan did during the period of its regeneration or the same sacrifices which the Prussians made after Jena when they were humbled to the dust, we may be certain of our regeneration. We should be prepared to make such sacrifices as have been made by civilized nations who make enormous sacrifices of money, time and thought and even of many of their cherished sentiments. If we are desirous of attaining our idea and reaching the goal of ambition we must be prepared to make ample sacrifices for the reality of the struggle for existence and national development. (Cheers.)

The Maharaja of Bikaner on the Hindu University.

At a recent public meeting held at Calcutta in support of the Hindu University Scheme, His Highness the Maharajah of Bikaner said:—

The proposed Hindu University will fill a great part by being a teaching and residential University, providing for technical instructions and encouraging research and by, what is more important, including in its courses the teaching of religion. All the demands for religious teaching had, of late years, been steadily increasing, and side by side with it the conviction has been growing that character can best be built up when it rests on the precepts of a great and noble religion. Certain difficulties may at first present themselves as regards religious instruction, but no such difficulties should obscure the facts of its necessity. The Hindus, as also our Mussalman brethren, are proud of being the heirs of a great civilization, a great religion and a great literature. It is to foster and conserve these that the new two Mahomedan and Hindu Universities are now being promoted. But like everything new, the proposal has evoked criticism. It has been said that denominational Universities are liable to promote sectarian differences,

Perhaps, I may be permitted specially to touch on this subject. I would say, and I think I can count on the support not only of this distinguished assembly but also of our community at large, when I say that it is not in any spirit of hostility or unfriendliness to our Mahomedan brethren that this scheme has been launched, a scheme which, as a matter of fact, was mooted several years ago. Whatever the ideal may have been India is big enough for two such Universities as are now before the public, and situated as we are at the present moment, it must be conceded that much good can be done by diverting the charities and activities of the two communities towards the promotion of education by creating institutions which will appeal to them in a special degree. It is our earnest desire to work in a spirit of amity and concord, and in such a way that the Mahomedan and Hindu Universities may be looked upon as sister institutions, labouring to promote in their respective spheres the good of the children of our common country, and there is every reason to hope and believe that with both the institutions broadly organized, soundly managed and sufficiently endowed, and with the spread of knowledge which they will foster and promote, they will contribute towards creating a spirit of good-will among the members of the two communities, based on morality, reverence and duty. Their teachings will tend to tolerance and not to estrangement, and with the spread of education, of which this movement is a great landmark, both Mussalmans and Hindus will recognize the common humanity which unites them and the common goal to which they are striving by different paths. It is important to remember that both the Mahomedan and Hindu Universities are to be open to the students of all creeds and classes, and the mutual exchange of compliments and subscriptions between H. H. the Aga Khan and the Maharajah Bhadur of Dharbhanga and the other instances where the Mahomedans and the Hindus have contributed towards the educational institutions and schemes of sister communities, auger well for the future. The graduates of these Universities may be regarded as the flower of the youth of India. The Hindu University movement is a purely educational one. Politics have not, and will never have, any part in our project, and our ambition is to turn out loyal subjects of the King-Emperor and good members of society able to hold their own life. Worked on broad lines, it must maintain as it has secured the interest and confidence of the princes and people of India, and the cordial co-operation of the Government. It is gratifying to see from the constitution of the proposed University that the promoters are fully alive to these needs, and it will be a privilege and an honour to the Hindu University to have H. E. the Viceroy as its Chancellor. In this connection, I am sure, you will all be very glad to learn that H. B. the Viceroy has very kindly authorised me to express his sympathy with our Hindu University movement and his good wishes for its success. Before concluding I would like to join in the appeal to the princes and people of India to subscribe liberally to the funds of the University. It is encouraging to hear that over Rs. 43 lakhs have already been subscribed. I hope that this amount will be soon doubled and that before long a sufficient sum will be forthcoming to make the Hindu University not only self-supporting but the first educational institution in India, fully equipped with the most modern appliances and inspired by the culture of the East.

Indian community, they have greatly deserved. Should Mr. Gokhale be able to come amongst us, I can promise him a splendid welcome, both as a great Congressman and a great Indian. My only regret is—and it is a very real and sincere regret—that, owing to the termination of our struggle for theoretical racial equality, we cannot send him to Government. I earnestly trust that Mr. Gokhale's example will be followed by other Indian leaders. They will find—not demigods or hero-figures—but cooks and hotel-waiters, ignorant hawkers and pedlars, petty traders and few merchants, a handful of clerks and a sprinkling of professional men, who distant though they are from this great Motherland of theirs, have realised that her honour has been committed to their care, and that they are obliged, in the name of the Indian nation, to keep the flag flying.

I am certain that your Indian leaders will return to this country, filled with a renewed and an unflinching faith in the capacity and fundamental character of their countrymen, and in the future destiny of India. I am certain, too, that they will not rest until they have summoned a special session of the Congress, that will have one sole task set before it—the determination of the real position and status of India in the British Empire. That position has never yet been positively defined, but unless it is, and that speedily, it will mean disaster both to India and to the Empire.

In its Empire Day Supplement, the *Times* contained a special article, whose author was allowed unchallenged to set forth the proposition that, whilst it was true that, the Proclamation of 1858 and subsequent Imperial Proclamations, and the declarations of innumerable statesmen had laid the Crown under obligation to give the Indian people equality with all other subjects of the Crown, it was now felt by the European peoples of the Empire that their fulfilment was *impendent*, that these solemn proclamations, declarations, and treaties should be denounced, and that the people of India should be expected to accept this novel situation. I have no hesitation in believing that you will whole-heartedly condemn such a tremendous and impious reversal of Imperial pledges, and that you will claim for this country the high status, the lofty position, to which it is entitled "as the brightest jewel in the British Crown." I cannot say—for who can know?—what part His Majesty had in procuring the settlement of the Transvaal trouble, but the King-Emperor is now in this land, and it is for you to express to him your strong feelings that have been aroused at the treatment so harshly meted out to your fellow-countrymen in the self governing Dominions, so that, through his sympathetic influence, it may be notified to the people of these Dominions, through the highest channels, His Majesty's regard for his Indian people.

THE INDIANS OF SOUTH AFRICA.—Helots within the Empire! How they are Treated, By H. B. L. Polak. This book is the first extended and authoritative description of the Indian Colonists of South Africa, the treatment accorded to them by their European fellow-colonists, and their many grievances. Price Rs. 1. To Subscribers of the "Indian Review," As 12.

O. A. Natesan & Co. Bankuram Chetty Street, Madras.

BRITISH INDIANS IN SOUTH AFRICA.

Lord Lamington moved that a humble address be presented to His Majesty for all correspondence between the Colonial Office and the South African Administration on questions relating to British Indian subjects which has taken place since August, 1910. The noble Lord also asked the Under-Secretary of State to the Union Government regarding certain disabilities imposed upon British Indians resident in the Transvaal by the Draft Municipal Ordinance, how far the Draft Ordinance had been proceeded with and whether he could give the substance of the replies, if any, of the Union Government to the representations of the Secretary of State as to the complaints of the British Indian population regarding the operation of the Transvaal Gold Law, 1908, and Townships Amendment Act, 1908 and 1909.

Lord Emmott said that having been at the Colonial Office only a few weeks and this particular question of the treatment of British Indians being one of the most delicate, difficult, and complicated questions they had to deal with, he could not pretend yet to be master of the whole history of the matter. It was, of course, constant in recovering the careful consideration of the Government. As regards the Union of South Africa, there was published in March last a Parliamentary paper containing, among other papers, a draft Bill regulating immigration into the Union based on proposals made to the Union Government by Lord Crewe, when Secretary for the Colonies. The main object of these proposals was to put an end to the differentiation against British Indians and to terminate the movement of passive resistance to the regulations on the part of the Transvaal British Indians. The discussion in the Union Parliament revealed certain difficulties and defects in the Bill, especially regarding the question whether the fresh Indians annually admitted to the Union should have the right to enter the Orange Free State from which Amishas had been excluded by pre-war legislation. The Union Government, decided with the concurrence of His Majesty's Government to withdraw the Bill last Session with a view to introducing an amending Bill next year, and meanwhile an agreement had been arrived at with the Transvaal British Indians by which the passive resistance movement should be brought to an end. Correspondence on the subject was still proceeding, and he was not prepared to lay papers at the present time. With regard to the other questions, it would be sufficient to state that the Transvaal Municipal Ordinance was referred to a Select Committee of the Municipal Council, whose report would not be brought up until the Council met again in January. The specific points mentioned by the noble Lord were still the subjects of correspondence, but it would be found that the difficulties of which he had spoken had been to a large extent removed.

Earl Curzon of Kedleston, in congratulating the noble Lord upon his first appearance in his new capacity, expressed the hope that His Majesty's Government would keep their eyes fixed on the progress of the Bill, and would earn the gratitude not only of South Africa but of the Indian population by assisting to remove the obnoxious restrictions upon their every-day life to which Indian immigrants were at present subjected.

Lord Lamington withdrew his motion.

nevertheless that Rajputana cannot stand entirely aloof from the modern world, and he is making a determined, and not unsuccessful, attempt to bring the administration of the State into touch with Western ideas of progress without any undue sacrifice of Rajput traditions. He has been at great pains to stimulate the interest of his people in education, which is practically free in all the schools of the State, and the Kotah High School and the school founded specially for Rajput nobles owe a considerable debt to his personal encouragement. His Highness takes an equally keen interest in agriculture and industry, and especially in the revival of the beautiful muslin industry for which Kotah has long been famed. He has welcomed the new Bombay Baroda Delhi line which passes through Kotah, and which together with other local railway developments, has begun to bring Kotah into much closer touch with the rest of India. The influence of the ruling Chief makes itself felt also in the personal relations which he cultivates with the young sirdars of his State. In the grounds of the new palace which he built for himself outside the city, there are frequent social gatherings in which the Chief and his sirdars meet the members of the small European community on the friendliest terms; and he himself not only maintains but constantly frequents a small club, in which a good reading room with European literature is as conspicuous a feature as the tennis courts and polo grounds. Like almost all Rajputs he is a keen sportsman but unlike many of them that is not by any means the only side of European life that appeals to him.

THE CITY PALACE.

The old native city of Kotah was built, like most Rajput cities, to be a city of defence and offence in days of strife and stress. It is surrounded on three sides by great battlemented walls, while the broad stream of the Chambal protects it on the fourth side. It is less cramped for space than Bundi which is confined within the

mouth of a narrow gorge: But its streets though broader are by no means less picturesque and if they present more frequent signs of modern activities the romance of ancient times still linger about the latticed windows of many a stately mansion and in the mysterious courtyard of many a pillared temple.

The difference between Kotah and Bundi is that there is a new Kotah springing up beside the old, whereas at Bundi there is nothing that impinges upon the inviolate supremacy of the old.

Kapurthala Concessions.

A durbar was held in the Durbar hall, Kapurthala, presided over by His Highness the Maharaja, on the afternoon of the 30th December. His Highness announced certain concessions, among them being that henceforth non official members of the Kapurthala Municipality will be elected by the people instead of being nominated by the State as was formerly the case; that Kapurthala city will shortly be supplied with pipe water, and that agricultural banks will shortly be opened in the State. His Highness promised liberal grants for mass education, and announced that the custom of "gudain" or supply of fuel and fodder on the occasion of marriages and other festivities in the ruling family will be abolished. Mention may be made here in this connection that primary education has been free in the State since the occasion of the Tikka Sahib's marriage.

The Maharaja Holkar.

The Maharaja Holkar of Indore was formally invested with full ruling powers by the Agent to the Governor General, Central India, on the 6th instant. In the letter of the Viceroy that was read out at the Durbar there is one important passage—'As His Majesty's Secretary of State has already informed you, you will be expected for a time to consult the Resident in important matters, and not to act contrary to his advice without further reference to my Agent in Central India, especially in matters involving the reversal of the decisions of the Council of Regency.' The young Maharaja was lately in England and very likely the Secretary of State personally conveyed this advice to him.

INDUSTRIAL AND COMMERCIAL SECTION.

German Swadeshim.

• We are familiar with the all-British Week, when all Britishers are expected to buy and sell only British goods. But Germany, here as in all other things, is trying to outstrip England. A Florence paper gives the following precepts from a German pamphlet recently published and circulated throughout the Empire to appeal to the *swadeshi* spirit of Germans and to induce them not to purchase imported goods:—

“In all expenses keep in mind the interests of your own compatriots.

Never forget when you buy a foreign article your country is the poorer.

Your money should profit no one but Germans. Never profane German factories by using foreign machinery.

Never allow foreign eatables to be served at your table.

Write on German paper with a German pen, and use German blotting paper.

German flour, German fruit, and German beer can alone give your body true German energy.

If you do not like German malt coffee drink coffee from German colonies.

Use only German clothes for your dress and German hats for your head.

Let not foreign flattery distract you from these precepts, and be firmly convinced, whatever others say, that German products are the only ones worthy of citizens of the German Fatherland.”

Beer, even though it be German, ought to be abjured by Germans as well as by all other peoples. Even *swadeshim* cannot make it a right thing to indulge in alcoholic drinks or in narcotics. Among the visible results of the *swadeshi* spirit in India is the establishment of some new cigarette factories. Should we vie with other nations in poisoning ourselves?

State Recognition of Experts.

The recognition which should be demanded for engineering manufacturers and other commercial leaders is not of the kind which seeks Court and other influential patronage for its own sake. The object in view is twofold—first to give our manufacturing industries the full benefit of State prestige; and, secondly, to attract to manufacturing and commercial life the most highly educated members of the rising generation.

As regards the first, one has only to turn to Germany for a clear and significant example. The German Emperor has never contented himself with the bestowal of advice on manufacturers and merchants; he has made himself their active ally, and has given them the full benefit of his vigorous personality. There is an authentic story of a dinner to which he invited a number of leading manufacturers in order to hear their accounts of the conditions and prospects of business. The accounts were not too cheerful, and after listening to all that had to be said, he remarked, “Well, gentlemen, I see I shall have to go travelling again.” On another and more recent occasion he had, as guests on board his yacht during a fortnight's cruise, some prominent manufacturers as well as financiers and statesmen. No great imagination is needed to suggest the subjects which they discussed. It is perfectly clear that when manufacturers are treated in this way they will feel encouraged to embark on fresh enterprises with confidence and enthusiasm.

Central Bank of India.

Certain recent failures have proved to the public the inadvisability of having dealings with institutions the head office of which is not working before their eyes but away from them. This Bank will have its head office in Bombay and the shareholders and depositors will have the opportunity of knowing the nature of business done by the Bank and the lines on which it works.

Metal Cloth.

A well known Eleberfeld firm have recently placed on the German market an entirely new product. Renar yarn, as it is called, is composed of a core, made of any suitable medium, and by means of a special process this core is covered with a metallic coating with which it becomes thoroughly incorporated. All the lustrous metallic particles are so imbedded in the external coat that they are protected from atmospheric and other extraneous influences, and are thus able to maintain their lustre for an indefinite period. Another advantage that is claimed for it is that it retains its colour and never gets black or oxidized. The yarn is being produced in practically every original metallic colours known, gold, silver, copper, etc., and there are many modern shades, which are reminiscent of silk and metallic lustrous combinations. The yarn can, as a matter of fact, be worked up with artificial silk.

The Indian Bank, Limited.

We print elsewhere in this issue a halftone print of the fine Buildings of the Indian Bank Ltd, which it now owns and occupies. From the Balance Sheet and Profit and 2000 Account which we have perused we notice that the gross profits of the Bank amount to Rs. 2,28,437, and that after meeting expenses a net profit of Rs. 92,265 has been made. Taking into account the amount brought forward according to the balance sheet for the year 1910 as well as the amounts of the *ad interim* dividend for the half year ended 30th June 1911 and the Branch Preliminary expenses written off, the Bank is able to show Rs. 61,385 as now available for disbursement. Out of this amount a dividend of six per cent is proposed to be given now also; and the Reserve fund raised, by adding Rs. 25,000 to it to Rs. 75,000. We wish the Bank a long and prosperous career.

AGRICULTURAL SECTION.

Agriculture In India.

Dr. H. H. Mann, the Principal of the Agricultural College at Poona, addressed the Lingayat Conference at Poona, on the 29th December, on the subject of "Indian Agriculture." In substance he spoke as follows.—

It had often been said that the farmer in India was most unwilling to learn anything new or to adopt anything improved. The speaker did not believe that, for he was in close touch with the agriculturists in that part of the country and knew better. The farmer first needed to be convinced that the new method was an improvement and, therefore, really and truly a profitable one to him. Once convinced of this, no farmer was more willing than the Indian farmer to adopt new methods. At this date and, within the speaker's knowledge, there were 5,000 European ploughs, of the European pattern in use in the districts round about. He knew that in one single village in the Sholapur district there were 100 such ploughs at work. Surely that did not show any unwillingness on the part of the Indian farmer to adopt new ways and improved methods.

The Indian farmer was handicapped owing to certain disadvantages under which he had been labouring these many generations. (1) He had no knowledge. He must be educated and informed in his own work by giving him such information as would be helpful to him in carrying on his farming operations. (2) He had no capital at his command. Such capital must be placed within reach by founding Co operative Credit Societies that would give him money at easy and reasonable terms of interest. (3) He was utterly ignorant of Western and more improved methods of farming. Send him to Agricultural Schools and put him into touch with what

or recurring, of expenditure incurred by Government or by any public body in establishing rural schools of agriculture where the vernacular is the only, or the main, medium of instruction; (b) giving grants in-aid of experiments conducted by Government, or by any person with the approval of Government, having for their object the introduction of improved methods of agriculture suitable for use in the Presidency inclusive of Sind; (c) giving grants-in-aid of experiments conducted by Government, or by any person with the approval of Government, having for their object the devising of new or improved agricultural machinery for use in the Presidency inclusive of Sind.

The Aims and Objects of the Agricultural Department.

Prof. Higginbotham, M. A., B. Sc., writes in the quarterly Bulletin of the Agricultural Department:—

A department of Agriculture is being added to the College in order to increase its all round helpfulness to India. Agriculture is the dominant industry of this land, and when one examines carefully into its natural advantages (1) of climate (crops will grow the whole year round), (2) of natural fertility of soil, (3) of moisture supply, one is driven to the belief that agriculture will remain the leading industry of India for a long time to come. Further, not only is agriculture the dominant industry of India but it is the fundamental industry upon which all other industries are based. The wealth taken out of the first foot of the earth's surface exceeds by several hundred-fold all the mineral wealth taken from greater depths.

One hundred years ago the methods of cultivation in Great Britain and America were as crude as the methods in India to-day. Agricultural investigation is very modern and yet the little that has been found out has lifted the burden of drudgery from those farmers in America

who have followed in the wake of science and to day the agricultural class of America is better off than any other large part of the community.

Now, if the adoption of scientific methods has brought about such great changes in the West, ought we to be afraid of trying them in the East? Many who know India well have said it is impossible to improve either methods or conditions. If this is so, then indeed is India in a sad way, but experience shows that in India progress can be made if the right method of introduction is hit upon.

The plan is to have a regular four year course in agriculture for Entrance passed men. This would lead to a degree in agriculture if the agricultural colleges are ever affiliated. So great, however is the fear of students who are considering taking such a course that there will not be profitable employment, that at first students are not likely to come in great numbers to take the regular course. As our object is to help India through its agriculture we are therefore preparing to offer special short courses to approved students in such subjects as market gardening, fruit culture, special crops, sugar-cane, cotton, oil seeds etc., and dairying. So that if a man has land of his own specially adapted for growing a given product, in three or four months he may learn some few important principles that should help him to get more out of his land and at the same time to improve its productive capacity.

Part of the work will be to try out seeds, to test varieties, to find suitable implements for use in India. That this work is of no small importance may be gathered from the fact that the discovery of the fixation of the nitrogen of the air by legumes has been called the most important discovery and single addition to human knowledge made during the nineteenth century.

Departmental Reviews and Notes.

LITERARY.

THE KING'S TASTE IN BOOKS.

A highly interesting indication of the King's versatile taste in literature is afforded by the following list of books included in the library which he took with him on his voyage to India in the "Medina":—

- Essays and Biographies (Macaulay).
- Froude's Short Studies.
- Barlasch of the Guard (Merriman).
- With Edged Tools (Merriman).
- Saturday Bridge (Dalton).
- Twenty-one Days in India.
- Rulers of India (Thomson).
- The Newcomes (Thackeray).
- Pendennis (Thackeray).
- The Virginians (Thackeray).
- Rupert of Hentzen (Anthony Hope).
- Shakespeare.
- British Dominion in India.
- Dombey and Son (Dickens).
- Bacon's Essays.
- Chambers' Biographical Dictionary.
- The Abbess of Vlaze (Stanley Weyman).
- Lavengro (Borrow).
- Romany Rye (Borrow).
- British India (R. W. G. Frazer).
- Numa Roumestan (Daudet).
- Inquire Within.
- Warren Hastings (Trotter).
- Life of Sir William Butler.
- Familiar Quotations.
- Concise Oxford Dictionary.
- Life of Gladstone (Morley).
- Ramparts of Empire.
- The Happy Vanners (Keble Howard).
- The Truth about Egypt (Alexander).
- Wordsworth's Poems.
- Modern England (Justin McCarthy).

THE FIRST NEWSPAPER.

Proud as the Western nations are of being the pioneers of most modern inventions, there are many important things which we have to own to copying from the people of the Far East.

The first newspaper, for instance, was Chinese. There have always been a number of spies and intriguers hanging around the Chinese Court and many of these were in the habit of taking advantage of their position by publishing State Secrets. These they wrote upon posters, and carried round Peking, receiving bounties from the curious for doing so. The Government denounced this as "an improper practice" but allowed it to continue, all the same, and one day it occurred to some smart Chinese, that more money might be made by printing copies, and selling them for so much apiece. The experiment was tried with great success, and hence the "Pekin Gazette" came into being.—*Dacca Herald*.

MRS. SAROJINI NAIDU'S NEW BOOK.

An interesting book in Mr. Heinemann's list of forthcoming works is a new volume of poems by Mrs. Sarojini Naidu, a Bengali lady, who went to London about sixteen years ago, and spent some time in study at Cambridge. Even then she was known for a poet who used the English language with a perfect command of touch and feeling, and since then, during the years of her married life in India, her muse has gathered in grace and delicacy. "The Bird of Time," her new book, will have an introduction by Mr. Edmund Gosse, who was the first critic to appreciate the promise of her youthful work.

NEW BOOKS ON INDIA.

Messrs Longmans announce a work, entitled "Indian Shipping: A History of the Seaborne Trade and Maritime Activity of the Indians from the Earliest Times," by Mr. R. K. Mukherjee, Professor in Indian History in the National Council of Education, Bengal. Dr. B. N. Seal contributes an introductory note,

EDUCATIONAL.

EDUCATION FOR CONVICTS.

The Government of Madras have issued the following order :—

The Government have directed that an attempt should be made to provide some educational facilities for long-term convicts on the lines initiated in the special jail for adolescents at Tanjore. The experiment will be confined in the first instance to three selected jails, viz., the Penitentiary and the Central Jails at Rajahmundry and Cannanore. In these jails, instruction will be given to any convict not over thirty years of age who may express the wish to be taught. There will be two classes, one for literates and the other for illiterates, and the instruction will be confined to reading, writing and arithmetic. While the scheme is still experimental an hour's lesson a day will be taken out of the hours of labour, and any convict who shows himself unlikely to profit from the instruction will be deprived of the privilege. Teachers will, as far as possible, be furnished from among the convicts themselves, but the Inspector-General may appoint a schoolmaster on Rs. 20 in each of the three selected jails to supervise and take part in the teaching.

The Government have also directed that copies of the Bible, the Gita and the Koran be placed in every jail library, together with a selection of books containing simple moral lessons and works on religion of a non-sectarian type, and every facility will be accorded the convicts to read them.

EDUCATIONAL REFORMS IN JAPAN.

Japan has entered upon what appears an important scheme of educational reform. She has had for the last seventeen years a system of high schools, founded with the double purpose of giving

technical education to the graduates of the middle schools and preparing them for the University course. But when the *Technical College Ordinance* was enacted in 1903 technical education was transferred to various technical colleges and the high schools became mere preparatory schools for students aspiring to take courses in the Universities. A great part of the object for which the schools were founded was thus lost. By the new scheme these schools are to be increased to twenty, and they will be used for the "universalisation of higher common education." At present there are 700, to 1000 students on the roll of each; under the new scheme the number will be limited to 480. The curriculum of the middle schools is left practically intact, and the arts of fencing and jiu jitsu have been included. As to elementary schools, the daily school hours have been extended to six, and practical business lessons have been included. Private middle schools and technical colleges are fairly numerous in Japan, but many of these stand on a weak basis.

THE DURBAR EDUCATION GRANTS.

The Hon. Mr. G. K. Gokhale asked at a recent meeting of the Viceroy's Council "Will the Government be pleased to state whether the sum of 50 lakhs for "the promotion of truly popular education," announced by His Excellency the Governor General on the day of the Coronation Durbar at Delhi, includes the present State expenditure on primary education or is in addition to it, and whether the grant is an annual one or is only a non-recurring allotment?"

Sir Harcourt Butler replied :—*"The sum of Rs. 50 lakhs for the promotion of "truly popular education," announced by His Excellency the Governor General on the day of the Coronation Durbar at Delhi will be an Imperial grant in addition to the existing expenditure on primary education, and will be an annually recurring grant."*

LEGAL.

LEGAL RIGHTS OF THE DOCTOR.

A remarkable case, which will doubtless attract world-wide attention, is being heard in the courts of Florida. It involves the oft-discussed question whether a person, who is suffering the agonies of an incurable disease may be killed as an alternative to a lingering death. All the parties principally concerned in the case belong to a sect known popularly as the "Shakers," but the official title of which is the "United-Society of Believers in Christ's Second Appearing." They seem to be a sect with a high reputation for gentleness and good works, and locally the trial is regarded with the more astonishment as this is the first time for many years that a member of this community has been called upon to answer a criminal charge. The two persons charged are Brother Gillette and Sister Sears, both of whom have confessed to killing a sister named Marchant, by giving her two ounces of chloroform at her request. Sister Marchant had long suffered from consumption which four weeks before her death became agonising. She frequently urged Gillette and Sears, who attended her to relieve her suffering by administering anæsthetic. They persistently refused until August 20th last, when she was seized with chills and a bad attack of hæmorrhage and was in dreadful agony. Gillette and Sears watched her in this state for two days, and could not bear to see her, suffering any longer. On August 22nd, therefore after prayers had been offered, chloroform was administered, and Marchant died. The news was sometime in reaching the authorities, but when the police began investigation Gillette and Sears immediately confessed. They are at present at liberty on bail, and it is, of course, improbable that any severe penalty will be inflicted on them. The popular wish is that they should be acquitted :—*Extract.*

ETIQUETTE OF THE BAR.

The following rulings of the Bar Council as reported in the *Law Journal* and the *Law Times* will be of interest to members of the legal profession in this country :—

(1) If a Counsel knows, or has reason to believe, that he will be an important witness of fact in a case about to be tried, he ought not to accept a retainer in the case.

(2) If a Counsel neither knowing nor having reason to believe that he is likely to be such witness accepts the retainer, but at the opening or any subsequent stage of the case before the evidence is concluded it becomes apparent that he is a witness on a material question of fact which is in issue, he ought not to continue to appear as Counsel unless in his opinion he cannot retire from the case at that stage without jeopardising the interest of his own client.

(3) If a Counsel knows, or has reason to believe, that his own professional conduct in matters out of which the action arises is likely to be impugned in the case, he ought not to accept a retainer in such action.

(4) If a Counsel neither knows, nor has reason to believe when he accepts the retainer, that his professional conduct in matters out of which the action arises is likely to be impugned in the case, but finds in the course of the case that it is so impugned he ought to adopt the same course of conduct as mentioned in (3).

(5) In either of the cases (2) and (4) above mentioned, there is no rule of professional ethics which debars a Counsel if he continues to act as Counsel in the case from going into the witness box and being cross-examined.

MEDICAL.

PREMATURE DEATHS AMONG EDUCATED INDIANS.

Rai Bahadur Lala Baij Nath, Retired Judge, Agre., writes as follows.—

The recent death of two of our important public men, the Hon. Mr. Krishnaswami Iyer of Madras and the Hon. Rai Bahadur Lala Ramannj Dyal of Meerut, from diabetes, in the midst of their career of public usefulness, has once more brought the question of the comparative longevity of our educated people to the front. As suggested by the *Times of India* any medical man of research who would investigate the causes whereby educated people die of diabetes would have deserved well of the country. Cholera, plague and fevers seem to claim as many victims from amongst the educated classes as from the others. But the former are greater sufferers than the latter from complaints like dyspepsia, constipation, piles, diabetes and other kidney diseases, lung troubles and nervous disorders like paralysis, &c., and unless something is done to minimize the evil, we shall be daily losing our best men at periods of life when they are becoming useful to the country, I am, therefore, desirous of taking up the enquiry suggested by the *Times of India*, should the leading medical practitioners in the country, both European and Indian, as well as our men of light and leading help me with their views on the following questions which I submit for public consideration. The conditions of no two parts of India are the same, and it is necessary to get the opinions of the best informed men from every part of the country. It would also be well if those who are suffering from diabetes and the other diseases mentioned above would give us the result of their experience and point out the causes by which these troubles were originally brought about, and what tends to increase or mitigate them. The questions submitted are merely

tentative and such as a layman can think of. Should any others suggest themselves to medical men, they may favor me with their views upon them also. Should we receive sufficient data to go upon I shall publish the result in a popular form free from professional technicalities, for public use, in consultation with some of our medical friends like Major B. D. Basu, I. M. S. (retired) of Allahbad who has already given much attention to the treatment of diabetes by means of suitable diet.

- (1) What are the most prevalent diseases amongst our men of education from which others not so highly educated are comparatively free?
- (2) Is their power of resisting disease as good as that of the others?
- (3) Are complaints like diabetes, lung troubles, paralysis, common amongst the educated classes of your part of the country?
- (4) Do they claim many victims and generally at what periods of life and which of them claim the most?
- (5) What conditions of life tend to favor these diseases and what the contrary?
- (6) Are any particular classes of food and drink or particular preparations thereof responsible for these complaints?
- (7) How far has the system of early marriages and the consequent loss of vitality to do with it?

The matter is of vital importance as affecting our well-being as a nation, and I hope all classes of medical practitioners as well as all our leading men and newspapers will kindly help the enquiry.

BAD TEMPER.

Brain storms have been investigated from the medical point of view by Dr. Maurice de Fleury. His view is that every time we become angry our vitality shrinks so much in proportion for every outburst. After even suppressed bad temper our vitality becomes less and less, until finally nothing is left. He goes even further, for he believes that each bout of anger, each rush of evil passion, cuts off a certain portion of the life we should enjoy if it had not happened.

SCIENCE.

A DISTINGUISHED SCIENTIST.

The death of so eminent a scientist as Sir Joseph Hooker deserves more than passing mention, even amid the stir of great events in India. Sir Joseph had rendered valuable scientific services to India, as the award of the G. C. S. I. in 1897 indicated. He was the son of Sir William Jackson Hooker, Director of the Kew Gardens, and was born in 1817. He entered the Royal Navy as a naval surgeon and first came into prominence in the scientific world by his observations as naturalist attached to the Ross Antarctic expedition in *H. M. S. Erebus*, 1839-43. His researches into the flora of the Southern Seas were epoch-making. Sir Joseph Hooker made many other journeys, on which he carried out remarkable researches as geographer, botanist and naturalist travelling in the Himalayas, Eastern Bengal, the Khasia Mountains, Syria and Palestine, Morocco and the Greater Atlas, and the Rockies and California. During his travels in the Himalayas he was detained in prison for sometime by the Raja of Sikkim. He was an early friend and supporter of the great Darwin and was the author of many standard works on botany, including "The Flora of British India."

PHOTOGRAPHY.

Recent years have witnessed many improvements and new discoveries in the science of photography in natural colours. All methods of direct colour photography and printing assume that all tints are the result of a combination of three primary colours—red, blue, and green. In the autochrome plate of the Brothers Lumiere, of Lyons, this principle has been adopted in a most ingenious manner. The three plates that have been employed by previous inventors are ingeniously combined on one plate, so that but one exposure is required. The sensitive film of the autochrome

is coated on glass previously prepared with a very thin layer of transparent starch grains. These *tiny starch grains, through which the image passes to reach the sensitive film, are dyed, some blue-violet, some green, and some orange-red, and are well mixed before applying to the glass. The action of the screen is to split up the image into primary complementary colours. After the negative is developed it is reversed by chemical action into a positive, and the tiny spots of colour which originally formed the colour filter now supply the actual colours for the picture, while the positive when viewed by transmitted light becomes an exact colour rendering of the original scene. A fine example of the work that can be produced by this method was recently published by "The Graphic," to which we are indebted for the details of the process.*

PHONE VOYANCE.

In an interesting little book by Mr. Vincent N. Turvey, entitled "The Beginnings of Seership," a new word is coined—"Phone-voyance" that is long-distance clairvoyance, in which physical contact is obtained by means of the telephone. Mr. Turvey tells the following story of his strange clairvoyant gifts: One day Mr. Pontifex, a friend of his, rang him up and said; "I have some friends here; do you think you could see anything for them?" As a general rule, Mr. Turvey is unable to "see" things at request, but this occasioned the solution of historical problems. He told Mr. Pontifex that he could see a "spirit" which came for a tall lady in black. "This, the reader will note," says the author, "is a description in itself, for I was not told that a lady was there at all." The lady in black who was with Mr. Pontifex thereupon came to the telephone, and the author gave her the description of the "spirit" form of a young man who was killed in the South African war.

POLITICAL.

INDIA'S INTEREST IN PERSIA'S TROUBLES.

'There can indeed be no question as to its being most desirable from the point of view of the defence of India that the *status quo* should be maintained in the Shah's dominions. The principle of the Buffer State fulfils Indian strategical requirements best, and it is most desirable in consequence that Persia shall remain an independent monarchy.' So writes a military correspondent of the *Manchester Guardian*.

The writer has observed, 'experience proves that when the troops of a powerful nation once overrun the territory of a weak and semi-civilised one it is apt to prove difficult to take those troops away again, even with every wish to do so, and experience, moreover, proves that such a situation not unfrequently provides excellent excuses for remaining in possession.' He continues:—

Our relations with Russia are at present most friendly owing to there being a certain international community of interests as between the two Empires. But this may change. The two nations may find themselves at some future date, as they have found themselves in the past in opposing camps. The feasibility of a Russian attack upon India may again become a source of grave pre-occupation to our statesmen and our soldiers. The heart of Persia is a long way from the backs of the Indus. The distance from Yezd to Sukkur is fully twice as great as is the distance from the nearest point of Russian Turkestan to Attock. But supposing the British Raj to be once extended westwards so as to include not only Baluchistan but also the country reaching to Shiraz and Bushire, and supposing a war thereafter to break out between ourselves and the great northern Empire, then a defeat of Anglo-Indian forces even on the remote borderlands would react far away back eastwards, and it might exert a most disastrous moral effect in India proper. The forcing back of our army upon Baluchistan would certainly gravely imperil our position in Hindustan. The overthrow of our troops would, moreover, be rendered likely by the fact that the conditions in the theatre of war ought to be very favourable to Russia.

The *Daily News*, enlarging upon the same aspect of the case, has pointed out that Russia's occupation of Northern Persia will create the gravest strategical situation in the history of the Empire. It will give India, for the first time, a

long land frontier with a first-class military Power, indeed, with two first-class military Powers—Russia and Turkey. It will turn the flank of India, and enable Russia, whenever she feels so inclined, to fight out the battle for India in the plains of Persia. It will in a military sense, wipe out Afghanistan, the Himalayas, and the deserts of Baluchistan as bulwarks of India. It will create in effect an Anglo-Russian frontier connected by a relatively short and direct railway with Moscow.

There is one other matter which calls for notice. The special correspondent of the *Daily Telegraph* has observed in a telegram of December 1, that the Anglo-Russian Agreement, which is now having such embarrassing consequences for Great Britain, has never been regarded in India except as a blunder.

'It will be difficult to persuade the "natives" that assent to the Russian aggression was not intended from the first, and part of a pre-conceived policy having partition as its end. But this aspect of the matter will not shock Indians, except those whose profession it is to be shocked by everything we do. A display of military strength is never wholly displeasing to the Asiatic.'

We are asked, therefore, to believe that the religious aspect is much more serious:

'Of late gradual exclusion of Mahomedan authority from Mahomedan lands has become a source of perpetual grievance to Moslems, and the whole Shia community will revolt against the expropriation of the only independent stronghold of the Shia branch of Islam.'

From the Indian point of view this is declared to be much the most important side of the affair. It is a very dogmatic statement and it stands in need of much qualification. The Mahomedans number one fifth of the population of British India and the proportion to the population varies from 14 per cent. in the United Provinces to 53 per cent. in the Punjab. But the Moslems in India and Turkey belong almost entirely to the Sunni or Traditional school of Islam. In Persia and Afghanistan the Shia sect preponderates and we question whether there is any more real religious agreement between the two divisions than there is between Catholic and Protestant in Christianity.—*India*.

GENERAL.

* RECRUITMENT TO THE PROVINCIAL SERVICE.

At a recent meeting of the Viceroy's Council, the Hon. Mr. Subba Rao asked :—' With reference to the reply given by the Hon. the Home Member to a question asked by me on the 22nd September last on the subject of the recruitment for the executive branch of the Provincial Service, will the Government be pleased to say whether they are now in a position to supply the information there requested ?'

Sir Archdale Earle replied :—' The necessary information has been obtained from the local Governments and a statement is laid on the table, which answers the first part of the question asked by the hon. member on the 22nd September, 1911. As regards the second part of the question, the hon. member is informed that the only province where the executive branch of the provincial service is filled exclusively by promotion from the subordinate service is British Baluchistan, and the reasons why such a course is adopted are :—(1) that the residents of Baluchistan are not yet fitted for the work of an extra Assistant Commissioner without considerable preliminary training in subordinate posts; and (2) that the residents of other provinces can only obtain knowledge of the special conditions of Baluchistan by working in the subordinate posts.'

POLICE TORTURE IN INDIA.

Mr. MacCallum Scott asked the Under Secretary of State for India: How many people have been tortured to death by the police in India or have died within a month of being tortured by the police since Jan. 1, 1906; and how many members of the police force have been convicted of murder in connection with these deaths.

Mr. Montagu: No doubt, unintentionally, the terms of this question differ in detail from those of the question put by my hon. friend on Oct. 31,

and Nov. 14, and postponed in order that inquiry might be made of the Government of India. I am now in possession of the information then asked for and trust that it will meet the purpose of my hon. friend. During the last six years there have been in the whole of British India fifty-seven cases in which policemen were convicted of ill-treating prisoners or witnesses. In six cases the ill-treatment occurred while the prisoners were remitted to police custody. In seventeen cases death ensued. The Government of India are consulting the local Governments and the highest judicial authorities on the questions of the remission of prisoners to police custody and the admission as evidence of confessions made before trial.

MOSLEM POLICY.

An important Moslem meeting was held in Calcutta on December 26th to consider the present position and determine the future policy of the Mussalmans. The Hon. Nawab Saiyid Mohammad Sahib Bahadur of Madras presided. Letters and telegrams expressive of their views from Sir Ibrahim Rahimtoola (Bombay), the Hon. Mian Mohammad Shafi (Lahore), the Hon. Nawab Nawabali Choudhri (Dacca), the Hon. Khan Bahadur Sharfraz Husain Khan (Patna), the Hon. Syed Mohammad Fakhruddin (Bankipore) and others were read by the convener, the Hon. Dr. Suhrawardy, who urged an immediate change of policy and a *rapprochement* with the Hindu community. After prolonged discussion the following resolution proposed by the Hon. Maulvi Abdul Majid Sylhet, seconded by Aga Moidul Islam and supported by the Hon. Mr. Ariff and Maulvi Wahid Husain was adopted :—That this meeting is of opinion that the time has come for the Mussalmans to change their policy towards other communities, but, considering the importance of the question, it is desirable that the line of policy to be adopted should be determined after further deliberation.

PERSONAL.

LALA HANS RAJ'S RESIGNATION.

The following is the official copy of the resignation tendered by Lala Hans Raj, B A., the Honorary Principal of the D A V. College, Lahore, and sent to Rai Bahadur L Lal Chand, M. A., President of the D A V College Managing Committee, through Bakhshi Tek Chand, M. A., the Secretary of the Committee.—

My dear Rai Bahadur,—It was in 1885, after I had graduated, that I wrote to your Committee offering my services to the D A V College as an Honorary member of its staff. My brother and myself felt at the time that in addition to the best efforts that were being put forth to raise a fitting memorial to Shri Swami Dayar and Saraswati, the greatest sage of modern times, something more was needed to further the cause which all of us had so much at heart. With this feeling I decided to devote my best to the D. A. V. College and for its success. You and your Committee were kind enough to accept my offer and appoint me first as the Head Master and later on as the Principal of this sacred institution.

The institution was opened on the 1st June, 1886. It had a small beginning but by the grace of God it now occupies a unique position among the educational institutions of this country. Numerically it is the biggest institution in the province, comprising 1,465 students in the School Department, 681 in the Arts College, 125 in the Engineering Department, 75 in the Vedic and Ayurvedic Departments, and 25 in the tailoring class. Not only in numbers but in educational efficiency also the D. A V. College and School have held their own in competition with the foremost institutions of the land.

1 The Arya Samaj has, of course, greatly benefited by the mental and moral resources which the

College has always placed at its disposal while the influence it has exercised on the public life of the province cannot be ignored.

The institution completed the 25th year of its existence on the 30th May, 1911. The 25 years of my service to the College also expired on the same date. In obedience to the vow I took in 1885 I have served with my whole heart and might the great Master through whom I received the light of Vedic Truth

Sir, it is very painful for me to break asunder the ties which have bound me to this sacred institution, but this must be done.

THE EARL OF CREWE.

The Hon. Babu Bhopendranath Bhan, on behalf of certain Hindu and Mahomedan noblemen and gentlemen of West and East Bengal, requested permission to wait in deputation on the Right Hon. the Secretary of State for India to offer him their respectful welcome to the province and congratulations on the announcement of the Royal boon. He has received the following reply from Mr. Lucas, his lordship's private secretary:—

"His Lordship desires me to say that while he much appreciated the kind sentiments of yourself and the gentlemen who are acting with you in proposing to wait upon him in deputation, and to present an address of welcome to the Province he regrets that he must decline the honour you propose for him. In so deciding he is acting in conformity with the practice he has consistently maintained throughout his stay in India in attendance on His Imperial Majesty, of receiving no deputations upon public matters. He desires me none the less to express his sincere thanks to yourself and your associates."

LALA HANSRAJ.

THE WATCHWORD OF HOPE.

BY

THE HON. MR. JUSTICE SHAH DIN.

The recent visit of Their Imperial Majesties, the King-Emperor and the Queen-Empress, to our shores has opened a new chapter in the history of the relations between England and her Eastern Dependency; and in view of the great administrative changes in this country which have synchronised with that visit, it is not too much to say that the political evolution of the Indian races has entered upon a new phase. Beneath the magnificent pageants, processions and cavalcades, which have marked the royal progress from Bombay to Calcutta, and the intense enthusiasm and spontaneous manifestations of loyalty with which all classes of Their Imperial Majesties' subjects have throughout the land received them, there lies a deeper meaning. A great Western nation conscious of her proud privileges and alive to her heavy responsibilities, has extended across the seas her right hand of political comradeship to an Eastern people in the sacred person of a common Sovereign to whom both owe unquestioning allegiance; and the latter has grasped the kindly hand with a warmth of feeling which affords but faint indication of inexpressible gratitude. The East and the West have at last met on an occasion of unparalleled significance,—unparalleled both for its profound solemnity in the present and also for its potential value in the sum-total of the progress of humanity in the future.

The Royal visit has set the seal on the recognition of India as an integral part of the British Empire which holds one of

the masterkeys to its stability and strength, and has drawn closer together the bonds of union between two great sections of the human race representing, in an especial sense, the old civilisation and the new. It has given us the most practical proof of the deep personal interest which His Imperial Majesty and His Consort take in this country and has conveyed to us in a most befitting manner the good wishes of the great English people for our continued progress and prosperity. It has enabled us to realize more fully than ever the chastening effect which, the presence of a just and sympathetic monarch, animated by the highest sense of duty towards those committed to his charge, produces upon his subjects in the East. It has proved, as perhaps no other event could have proved, that the value of the connection between England and India as one of real advantage to both is being increasingly appreciated; it has helped to quicken the sense of self-respect in a race of ancient lineage and hoary traditions; and it bids fair to prove the starting point of a vigorous growth of the body politic under the influence of a healthy environment.

The great British people, who represent the most stable elements of enlightened and progressive democracy in the twentieth century, have through their august King sent to their fellow-subjects in the Eastern Hemisphere a message of high hope and continued advancement, breathing in every word and line a spirit of large-hearted catholicity and of a sincere solicitude for their well-being. That message was nowhere better expressed or more gracefully delivered than in the ever-memorable speech which His Imperial Majesty the King-Emperor made in Calcutta on the eve of his departure from that city; and the words of

which are still reverberating throughout this country :—

“Six years ago I sent from England to India a message of sympathy. To-day, in India, I give to India the watchword of hope. On every side I see the signs and stirrings of new life. Education has given you hope, and through better and higher education you will build up higher and better hopes.

“It is my wish that there may be spread over the land a network of schools and colleges, from which will go forth loyal and manly and useful citizens able to hold their own in industry and agriculture and all the vocations in life; and it is my wish, too, that the homes of my Indian subjects may be brightened and their labour sweetened by the spread of knowledge with all that follows in its train, a high level of thought, of comfort and of health. It is through education that my wish will be fulfilled, and the cause of education in India will ever be very close to my heart.”

In delivering his parting “message of loving farewell to the Indian Empire” at Bombay, His Imperial Majesty struck a note of profound wisdom that will appeal with ever-increasing effect, as years roll on, to all true hearts in this country :—

“It is a matter of intense satisfaction to me to realize how all classes and creeds have joined together in the welcome which has been so universally accorded to us. Is it not possible that the same unity and concord may for the future govern the daily relations of your private life? The attainment of this would indeed be to us a happy outcome of our visit to India.”

Let us hope that the profound lesson conveyed in the above words uttered with a solemn purpose on a solemn occasion will ever be enshrined in the heart of modern India. If “the signs and stirrings of new life” visible on all sides are accompanied by “unity and concord” in the daily relations of our private life, the watchword of “hope” given to us by our great Sovereign may yet be employed towards the attainment of a high aim, and India may soon be enabled to occupy a not unworthy place in the glorious British Empire.

THE ROYAL VISIT AND ITS RESULTS. :

BY

THE HON. RAO BAHADUR R. N. MUDHOLKAR.

Now that the visit of Their Imperial Majesties the King-Emperor and Queen-Empress to India has drawn to a termination and they are on English soil, it would not be inappropriate to take stock of the results it has achieved and of the benefits it has conferred, and to make a forecast of the influence which that visit and the incidents connected with it would exercise on the policy of the British Government and the attitude of the British public towards India on the one hand, and on the sentiments and feelings of the princes and people of India towards that Government and that nation on the other. The event was an unprecedented one in the annals alike of England and India. Never before had a British Sovereign left the United Kingdom to visit any of its numerous colonies and dependencies. Nor had any foreign potentate exercising sway over any part of India ever before gone and mixed amongst his people. Their Majesties too came amongst us at a time when the spirit of lawlessness and crime which had seized some misguided and thoughtless persons was believed to be still exercising its baneful influence. And though it is unquestionable that the vast bulk of the classes and the masses are actuated by genuine loyalty the anxiety was not quite absent if there may not be a sudden recrudescence of the miscreant deeds of the few mad. It was only natural that a tour planned and carried out under such circumstances should be followed with deep interest in every part of the British Empire. But nowhere so much as in India and England has its happy and successful termination which has exceeded the expectations of the most sanguine naturally brought to the forefront the main questions ‘what is the cause of this success,’ ‘what are the lessons taught by it.’

When the announcement was made in March last, by H. E. the Viceroy in the Imperial Legislative Council that His Majesty the King-

Emperor had decided to come out to India with Her Majesty the Queen-Empress to announce in person to his loving and faithful subjects the solemnities of his Coronation, it was hailed with pæans of delight by the Indian people, and the Indian press. The King-Emperor's decision was approved by some English journals on the ground that its spectacular accomplishments would strike the imagination and touch the hearts of the Indians, who, it was said, love nothing so much as a show. A more superficial view, uncomplimentary alike to British rule or to the Indian people, cannot be conceived. The Indians have no greater love for pageants than Englishmen, and though idle curiosity and the desire to enjoy fun may attract individuals for a day to witness shows and cavalcades, no sober and responsible person would have cared to waste his time and money for the purpose of witnessing vain and empty pageants or would have refrained from entering his protest against the expenditure of public funds by tens and hundreds of lakhs on them. To the Indian mind the visit of the King-Emperor has a deeper and a more solemn meaning and a greater value than the mere gratification of the eye. To the Hindu the king is the embodiment of the Divinity. He is Vishnu in the form of man. Whatever the faults, foibles, and failures of an individual ruler, "the King" amongst us—as in the theory of the British constitution—"can do no wrong." Amongst the Mahomedans too equally strong and abiding is the veneration for King-hip. For generations past the people of British India could get no occasion for the gratification of a sentiment which was of the nature of a spiritual craving. Those who witnessed the scenes of pleasure and enthusiasm roused by the visits of the Duke of Edinburgh in 1872, of His late Majesty King-Emperor Edward VII as Prince of Wales in 1875, Their Majesties the present King-Emperor and the Queen-Empress as Prince and Princess of Wales in 1905; those who have seen what reverential and affectionate greetings exceeding any given to Viceroy and Governors were accorded by the practical and matter of fact Mahratta and the shrewd and businesslike Gujarathi to the Duke of Con-

naught, a mere Commander-in-Chief though he was, because he was the son of the Queen, will have some conception of the Hindu idea of the divinity which hedgeth a King. Failing the Sovereign, the Indian heart poured itself out to the Sovereign's son whenever it could have him. Intense therefore was the satisfaction of the country at the announcement that the King and the Queen themselves were coming out to India.

Another reason for the popular delight was that alive as the Indians are to the manifold blessings of peace, order, justice, education, and the various amenities of civilized life which the British connection has given to India, it is to the three great Sovereigns who have occupied the British throne during the last sixty years that the gratitude of the people goes for such political privileges as they have acquired. The Proclamation of 1858 is aptly regarded as the Magna Charta of India. The pronouncement against the colour bar made by the Act of 1833 received therein not a mere confirmation but a vitality and a reality, it had failed to secure till then. It was therein that the Indians for the first time received the message of the "Promised Land." And though the equality before Law and the equality of opportunity to all vouchsafed therein have not been fully realized as yet, it would be wrong to deny the great progress made in that direction. The Proclamation of 1908 is as great a heritage as that of 1858. It is well known that in the drawing up of both these Proclamations the two august Sovereigns from whom they emanated had no small share. Keeping strictly within the bounds of the constitution Queen-Empress Victoria and King-Emperor Edward VII exercised potent influence over the shaping of the policy and administrative measures of their successive ministers and especially those in regard to India.* The

To the introduction and development of the elective principle first in the Municipal and Rural Boards and later on in the Legislative Councils, the increase in the numbers of these elective members, the expansion of their functions, the extension of their authority great value is justly attached by educated, aye, even by uneducated Indians. With all these measures for liberalising the Indian administration the name of the good old Queen and of her equally good son are associated as they personally took a keen interest in their promulgation,

Indian's veneration therefore for his Sovereign inculcated by his religion and confirmed by tradition and habit had received stimulus and strength in the case of the Royal Family of England by the part which the occupants of the Throne have during the last sixty years taken in raising the status and ameliorating the condition of the Indian people.

To these predisposing causes which would under any circumstances have secured a warm welcome from the Indians to a grandson of Queen-Empress Victoria and son of King-Emperor Edward VII, there was added fortunately a further cause due to the personal merits of the King-Emperor himself. His visit six years ago as Prince of Wales had even while he was still touring created a most favourable impression about the goodness of his heart and the kindness of his feelings towards the Indians, which was developed into abiding respect, regard and esteem by the remarkable speech delivered at Guildhall in which he pleaded for sympathy being made the keynote of England's relations with India. It is a well known fact that the exhortation and the example of the Heir to the Throne helped in no small measure the policy of conciliation and reform which Lord Morley and Lord Minto were striving to carry out. On the top of these came the Royal assurances after accession to the throne, the visible improvement in the tone towards Indians of the truculent sections of the self-governing colonies and the relaxation of repressive measures in India.

Again, though the visit to India was not regarded with favour by a section of the Cabinet it was His Majesty's firm stand that enabled it to be undertaken. A long and tedious voyage, a still longer and fatiguing overland journey, a round of exacting political functions and social ceremonials from the day of landing to the day of embarkation and last but not least, the risk involved in sojourn in a land where criminal madness has made its appearance, were obstacles which would have scared not only ease-loving rulers, but the majority of ordinary men. It was a manifestation of a high sense of duty, great

personal courage and a confidence in the good sense and loyalty of Indians, aye, even of the misguided few, to insist upon going to India in spite of the labour, trouble and risk. These things could not be lost on a people so appreciative and responsive as Indians. They enhanced the momentous character of the Royal visit and made the people yearn to pay their dutiful homage, and accord their enthusiastic welcome to their King-Emperor and Queen-Empress who had manifested so much sympathy and regard for them.

What Their Majesties did day after day from the moment of their landing in Bombay intensified the loyalty of the people, heightened their esteem and deepened their grateful love. The gracious simplicity of their demeanour and the confidence shown in the people have created fresh bonds of attachment and devotion to the Royal pair.

The boons announced at the Delhi Durbar through H. E. the Viceroy are in themselves substantial and of great importance. Even if they had stood alone the country would have sounded with the appreciation of His Majesty's consideration for his subjects and his interest in their advancement. But the annulment of the Partition of Bengal announced by His Majesty himself which transcends them all in the justice of its conception, the wisdom of its policy and the beneficence of its results, has touched the hearts of the people and roused their enthusiasm in a manner which few other measures would have done. "The greatest blunder since the Battle of Plassey" as the Partition has been very appropriately described, an ill-starred measure unwisely conceived, thoughtlessly and unfeelingly carried out and obstinately maintained against the prayers and entreaties of millions, it has done far greater harm to British Rule than any other act with the exception of that stupid order about greased cartridges which brought about the conflagration of 1857. It had deeply wounded the Bengalees and roused them to exasperation in a manner and to a degree unknown hitherto. Its cynical high-handedness and manifest animus against the Bengalee Hindus hurt to the quick most of the other

communities also. It was the culmination of the policy of pin-pricking and treading on the toes of the educated Indians, riding rough shod over their feelings snubbing their aspirations, cutting down their influence and circumscribing their future, which obtained its culmination during the regime of Lord Curzon. The cult of the bomb and the appearance on the Indian horizon of the gaunt spectre of anarchical crime and revolutionary propaganda are due to it. As admitted by the Government of India in their Despatch of August last it had engendered bitterness of feeling which was widespread and unyielding, had created resentment in the Bengalees which even after the lapse of six years continued as strong as ever, brought about troubles following in its wake which were by no means at an end. Yet so strong was the factious and factitious spirit created among certain sections by the worshippers of "prestige," and so keen, it was known, was Lord Curzon and his friends on the maintenance of the Partition, which he regarded with pride as his *magnum opus*, that statesmen and administrators, who were convinced that the measure was according to the immitable humour of Punch "a cur whom no decent dog would own," shrank from the hazardous and arduous task of doing justice to a wronged community by redressing a real grievance. The only effective method to prevent unreasoning clamour or control, the outburst of unforgiving vanity, was to secure the direct co-operation of the Sovereign in the great and noble task of conciliation and the removal of a serious wrong. The work was one which was in consonance with the fundamental principles of British policy, and what is more in conformity with the dictates of justice, humanity and righteousness. But it demanded the combination of intellectual strength and moral courage with generous instincts, noble impulses and a high sense of duty. The existence of this happy combination in His Majesty has enabled the Viceroy and the Ministers to effectively secure the solution of a grave problem which bristled with enormous difficulties and at the same time clamantly demanded treatment. How beneficent, how invaluable, has been the in-

tervention of His Majesty is realised by all thoughtful men and instinctively though vaguely apprehended by the common people. And deep and overflowing are the feelings of gratitude, admiration, affection and love, roused by this noble step. It has touched a chord in the nation's heart which had not been touched before, it has forged bonds of affection and devotion stronger than any that existed before.

The assurances of sympathy and interest which grace every speech, the pledges solemnly given in the Royal Proclamation and on the occasion of every Imperial pronouncement to maintain, foster and develop liberal institutions, to associate the people more and more in the administration of their own affairs, to place them on a footing of equality with the other members of the British Empire, to promote education, and the material and moral well-being and progress of the nation are, it is thankfully recognised everywhere, no lip professions, no conventional phrases in King George V. The earnestness of the Message of Hope is a matter of accepted faith. The free and easy manner in which Their Majesties deported themselves, and the gracious and kind consideration they showed all round, have captivated the hearts of all classes; and the confidence they showed in the people in going into Indian quarters and amongst crowds of Indians, unattended and unprotected by Military or Police escorts, has stirred the hearts of Bengalees. And to-day there are no King and Queen who possess the love, respect, devotion and loyalty of their subjects to any degree equal to what King-Emperor George and Queen-Empress Mary received from their Indian subjects. Their Majesties' visit has added to the stability of the British Rule in India. Would that all the servants of the Crown do the like and follow in his footsteps.

King George's Speeches on Indian Affairs.—Part I. A complete collection of all the speeches made by His Majesty during his tour in India as Prince of Wales.

Part II. Full text of all the Speeches delivered by His Majesty during the Coronation Darbar Tour. Price One Rupee. To Subscribers, Rs. 12.

All About Delhi.—With 36 illustrations, Rs 1-8. To Subscribers, Rs. 1-4.

THE CORONATION BOOKS.

By

DEWAN BAHADUR K. KRISHNASWAMI RAU.

THE news that Their Imperial Majesties Emperor George V and Empress Mary reached London safely in sound health after their eventful and historical visit to India, has filled the hearts of their Indian subjects with indescribable joy and relieved them from their intense anxiety for their safe return home for which they (Indians) were offering most devout prayers to the Great Ruler of the Universe. That India is the brightest jewel in the Crown of Great Britain, was illustrated by the memorable visit which has come to a happy close, for, no other part of the vast British Dominions over which sun never sets, received the unique honor of the Imperial visit. Their Imperial Majesties have made such deep and lasting impression on the Indian mind by their exemplary condescension and sympathy, and by their charming manners and conciliatory disposition, that the mere mention of their most honored names evoke genuine feelings of admiration and love coupled with gratitude. The Coronation Books are worthy of the greatest Sovereign in the known world. They have touched all classes from the Ruling Princes to the humblest subject of His Majesty.

The abolition of the "Nazarana" which several Chiefs were, in virtue of an ancient custom, obliged to pay, has enhanced their dignity. Whatever justification there might have been for the payment of the "Nazarana" when it was introduced by the Mogul emperors, their payment under the modern conditions was felt as a relic of slavery. The statesmanship which selected this humiliating impost for abolition cannot be too highly praised.

The grant of 50 lakhs of rupees for Primary education is a most beneficial measure in the interests of the masses. It is, no doubt, inadequate for the purpose intended. But it goes a great way to supplement the funds likely to be raised by the Educational Bill of

the Honorable Mr. Gokhale which, it is hoped, will soon become law. Its significance lies more in the recognition of the necessity for mass education than in its amount, especially as it is accompanied with a promise of its increase.

The annual pension sanctioned to the holders of the titles of Mahamahopadhyaya and Shams-ul-Ulma, is a gratifying revival of purely Asiatic patronage to high scholarship in Oriental Classics. Among Pundits, a grant of this description is known as "Varushasanam." *Many Native Princes still continue the practice of granting it to learned men.* As a rule, Pundits and Ulmas are comparatively poor, as their learning does not enable them to earn money like the learned and industrial professions. The pensions now sanctioned will enable them to devote themselves to further study. But for this timely help and encouragement, the classics would soon be extinct in British India.

The grant of distinctive badges to the holders of Indian titles such as Dewan Bahadur, Sirdar Bahadur, etc. supplies a desideratum, and is highly appreciated by the holders thereof. The Sanad granted to them under the signature and seal of the Viceroy and Governor-General, could not obviously serve the purpose intended by the badge which can be worn by those entitled to wear them on all public occasions.

The Army, the Navy and the Civil Service have received special marks of Imperial favour which will act as a further incentive to meritorious service. The civil debtors and prisoners had their share of the boons, the only regrettable exception being the political offenders whose release was generally anticipated.

The restoration of Delhi of Moguls (Indraprastha of the Pandavas) to the position she held as the Capital of India, is a distinct concession to the Indian sentiment. Calcutta is naturally sorry for the loss of her pre-eminence, but her importance as an intellectual, commercial and industrial centre, will not suffer by the removal of the Viceregal Court to Delhi. The Simla season practically lasted

for 9 months from April to December, and the Viceregal Residence in Calcutta barely exceeded 3 months. The City of Palaces ought not to feel keenly the absence of the Governor-General for 3 months, especially with a full-blown Governor to take his place in all public functions.

The conciliatory policy which is evident in the modification of the partition of Bengal, is of highest importance.

The careful selection of the boons reflects greatest credit upon their Lordships Hardinge and Crewe. It may be stated without fear of contradiction, that they have made the Indian public forget that they are under a foreign rule, and realize that they are the citizens of the greatest Empire, the history has known.

His Majesty's Visit to India.

[In connection with the Symposium on the King's Visit to India, which we published in our last issue, we have no doubt the following select pronouncements on the subject will be read with interest.—Ed. I. R.]

THE HON. SIR P. M. MEHTA.

We must remember that the boons announced at the Coronation Durbar are not all the boons that he has conferred upon us.

Among others, there are two of priceless value for which we are grateful. The first is the boon of the bright example which he has set as to how to regulate mutual treatment and intercourse between all his subjects—rulers and ruled—founded on mutual self-respect and human sympathy. The permeating influence of that example cannot fail to penetrate among all ranks of society and help in the solution of a problem which has caused the gravest anxiety among all friends of the British connection and has baffled the efforts of the best and wisest amongst us all to find a remedy. The second boon is, that, in drawing the hearts of all his subjects towards himself, their common Sovereign, he has drawn closer the ties of peace, harmony and union among themselves, however differing in race, religion, or colour.

THE HON. SIR IBRAHIM RAHIMATULLA.

To the ruling classes Their Majesties have clearly shown how easy it is to win the hearts of the people. Throughout the land the intense feeling of gratitude and attachment which has spontaneously sprung up towards Their Majesties shows in the clearest manner that the hearts of the Indian people can be easily won. If the lesson taught by the Royal visit is taken to heart by the official classes and sincere efforts are made to win the hearts of the people they will undoubtedly render a great service to the British Empire and to the people of this land.

THE HON. MR. JUSTICE SANKARAN NAIR.

For the great step that was taken for removing the capital of India from Calcutta to Delhi the reason assigned was that it was necessary to associate the Indians more and more in the government of this country and for that purpose it was necessary that there should be greater devolution of powers to the Provincial Governments, and that for the purpose of materially facilitating—I am repeating the Viceroy's words—the growth of local self-government on sound and safe lines, it was necessary to remove the capital. If this is not returning to the traditions of Lord Ripon, I cannot understand what it means. It does not require a sanguine temperament to see in these words that in the near future or at any rate, so soon as circumstances permit, we expect more extensive powers to be granted to local Legislative Councils, more powers of criticism and, perhaps, greater powers of control . . . There have been promises made in the Proclamation of 1858 and in the subsequent Proclamations there have been various promises made, but the promises now made—I call them promises—stand on a very different footing and almost all of them are accompanied, as we see in course of time, by acts which fully explain their meaning and which show the earnest desire on the part of those who are responsible for those measures and utterances that they should be carried out. The occasion of the visit of the Sovereign has been a unique one in the history of India and its success has been unique.

THE VICEROY'S MESSAGE TO LORD CREWE.

The Ruling Princes and Chiefs of India on the one hand, and the Non-official Members of my Legislative Council acting on behalf of the people of British India on the other, desire that I should forward to the Prime Minister the following message from the Princes and people of India to the people of Great Britain and Ireland. Telegrams from the leading Ruling Princes and Chiefs signifying this desire have been received, and the Non-official Members of my Council have acted on the authority of Public Meetings held at important centres in the different Provinces, at which Resolutions expressing the sentiments embodied in the message have been adopted:—"The Princes and People of India desire to take the opportunity afforded by the conclusion of the Royal visit to convey to the great English nation an expression of their cordial goodwill and fellowship, also an assurance of their warm attachment to the world-wide Empire of which they form part and with which their destinies are now indissolubly linked. Their Imperial Majesties' visit to India, so happily conceived and so successfully completed, has produced a profound and ineffaceable impression throughout the country. Their Imperial Majesties by their gracious demeanour, their unflinching sympathy and their deep solicitude for the welfare of all classes have drawn closer the bonds that united England and India, and have deepened and intensified the traditional feeling of loyalty and devotion to the Throne and person of the Sovereign, which has always characterised the Indian people. Conscious, of the many blessings which India has derived from her connection with England, the Princes and people rejoiced to tender in person their loyal and loving homage to Their Imperial Majesties. They are confident that this great and historic event marks the beginning of a new era ensuring greater happiness, prosperity and progress to the people of India under the reign of the Crown.

HIS MAJESTY ON HIS INDIAN TOUR.

The King, replying to a congratulatory address from the City Corporation at Buckingham Palace on February 10th. said:—

The homage we received from the princes and rulers in India and the devotion manifested wherever we went deeply moved us. We believe that these signs of affectionate loyalty testify to the undying attachment of the peoples of India to the Crown. I am confident that you, representatives of the City of London, the heart of the motherland, and all my people in these islands, will welcome and reciprocate the assurances contained in the message of cordial goodwill and fellowship from the princes and peoples of India.

Replying to a deputation from the London County Council, King George said:—

'I am gratified that the brilliant and momentous event past has been followed with such sympathetic interest by London. I trust this interest will lead to a deeper realization by all my people of their responsibilities towards the Indian Empire. The enthusiastic and affectionate loyalty which greeted the Queen and myself throughout our journey will always be to me a source of inspiration in my endeavour towards the general well-being of my subjects.'

King George's Speeches on Indian Affairs.

PART I.—A complete collection of all the speeches made by His Majesty during his tour in India as Prince of Wales.

PART II.—Full text of all the speeches delivered by His Majesty during his Coronation Durbar Tour in India.

APPENDIX containing the Coronation Boons and Proclamations of King George, King Edward and Queen Victoria.

The Ethics of the Great Aryan Teacher.

BY

THE ANAGARIKA DHARMAPALA.

FOR two thousand and five hundred years the noble Religion of Compassion had existed giving solace to the many millions upon millions of human beings. Its keynote being freedom its followers are joyous in that it gives the impulse to soar into the lofty heights of intellectuality where rationalism and transcendentalism reign. It is the Religion which looks up to Supreme Wisdom as the highest attainment worth striving for in this earth life. The destruction of Ignorance is accentuated. Ignorance is the root evil producing suffering here and hereafter. Heavens, deities, devils exist, Buddhism does not ignore them, but what the great Teacher did emphasise was that even the gods were powerless before the majesty of Eternal Law. Law reigns supreme. The ignorant man not knowing the operations of the great Law of Cause and Effect commits evil which engenders causes producing effects which again produces suffering and misery either here or hereafter. There is no known beginning of the individualised personality. Consequently, Buddhism repudiates as false the theory of Creator who created the world out of nothing. Such a thing could not be that a god could exist where nothingness prevailed. Space and Nirvana are eternal according to the Teachings of Buddha. And the great Law that he promulgated gave thinking people food for thought. Everything is momentarily changing, undergoing a threefold evolution of birth, stationariness, disintegration. Every individualized cell, every atom, everything in the universe, our individual feelings, perceptions, ideations, are changing with radio-active rapidity. There is nothing that one can cling to and call it this is mine, and I am that. Attachment, therefore, to phenomenal things is due to the ignorance of the great law of Dependent Causation. If everything in the universe is changing from one thing to another

which is the result of the Causal Law and when we consider that this change is productive of eventual suffering, what wise man will cling to the sensations and perceptions that are to produce pain and suffering? The panacea which the Buddha discovered to destroy this eventuality is the Middle Doctrine of the Noble Eightfold Path.

The Buddha is the Tathagato, the Successor of the former Buddhas. To be a Buddha a highly developed human being has to make the greatest renunciation of the highest attainable happiness and take the vows of the ten paramitas under a living Buddha, and continue life after life to fulfil the perfections of Charity absolute, even to the giving of one's life, children, wealth and everything that is dear to man; live the life of complete moral perfection, renounce pleasures with disinterested motives, educate oneself to gain perfect wisdom, endeavour strenuously to walk in the path of truth, always to speak truth even at the risk of life, to show unlimited patience and never show anger, development of will power by the force of truth, to show universal love, and be equal minded. These perfections the future Buddha, or the Bodhisatva, to use the appropriate term, has to fulfil for many million births. The Bodhisat in the last birth was known as the Prince Siddhartha, son of the Raja Sudhodana of the Sakya clan of Gautama Rajputs, of the family of the Ikshvaku and of Queen Maya. On the full moon day of the month of May the Bodhisat was born at the Royal Garden of Lumbini in the Himalayan slope, not very far from the present railway station of Uska Bazar. The life story of the Sakyan Prince has been told exquisitely by the late Sir Arnold in his immortal epic "The Light of Asia." It is the story of the Great Renunciation of the compassionate merciful hearted Prince, who left his palace, parents, wife, and his only son, the little prince Rahula. For six long years the Bodhisatva followed the path of asceticism, mortifying his body, exposing himself to a rigorous self-denial until his vitality failed and he fell down in a swoon, and when he became conscious he resolved to abandon the ascetic life and adopt a middle

for the amelioration of the poor, the ignorant, the fallen. What a comforting Doctrine in this age of selfishness and aristocratic pride is this Dhamma! We are all equal at birth, all equal before death, all sympathise with old age and with illness. Renunciation is the foundation of Immortality. It is not the Renunciation of the pantheistic ascetic, it is not the Renunciation of the slave, the fanatic, the bigot, to get the goodwill of a superior being, it is the Renunciation of a king for the welfare of his subjects, the Renunciation shown by the mother to her loving child. This sublime Doctrine is poison to the sensualist, to the theologian, to the despot, to the aristocrat, to the plutocrat, to the indolent, to the monothest, to the pantheist, to the nihilist.

Let us reflect for a moment and see whether it is practical and practicable to follow the Doctrine of the Great King-Emperor of Righteousness. He tells us not to destroy life, not to steal nor take things not given, not to sensualise, not to utter untruths, and to abstain from alcoholic intoxicants. The Great Teacher for the first time enunciated the *attupanaika dhamma*, which connotes that one should not do to others that which he does not wish that others should do to him. On this foundation He taught the householder to abstain from killing, from stealing, from committing adultery, from taking alcoholic intoxicants, from lying, from using harsh language, from slander, and from useless talk, from covetousness, from ill-will. Will not society enjoy the benefits if there was mutual goodwill, each one sharing the good things with the other? The positive virtues which the Blessed One inculcated are Charity, Moral Conduct, Rational analytical Reflection, nursing the sick, the feeble parents &c., paying homage and showing obedience to parents, spiritual teachers, elders, taking a share in the good work that others do, and giving a share to others in the good work one does, preaching and teaching the Good Law, listening to the Good Law, and holding fast to the Moral Law of Evolution. These are the good Kusala enunciated by the Tathagato. Could one find anything superior to the moral Code pro-

mulgated by the Lion of the Sakyas? The life of strenuous activity of forty-five years provoking others to moral activity is given in detail, in its fullness in the literature imbedded in the Vinaya and the Sutta Pitakas. It is in the mellifluous, sonorous language called Pali that all that is sublime, aesthetic, rational, psychological, philosophical is to be found. Happy is the man who reads the Pali Dhamma. He is taken back to a period of activity in ancient India, when all India was free. Free from the shackles of despotism, from aristocratic arrogance, from bureaucratic insolence, from monotheism, from ritualistic orgies, pagan superstitions, such was ancient India under the good Aryan kings influenced by the compassionateness of the incomparable Doctrine of the all-merciful Tathagata Buddha Gautama. Once a Brahman asked the Buddha what His caste was, and the answer was "do not ask about my caste, ask about character, that is ask about the profession that one follows." To know a man's character we have to find what profession he belongs to. By his profession the man's caste can be known. This was a new aspect of the old caste question. He is the low-caste who destroys life and violates the moral precepts and abstains from doing good to his fellowmen. The Brahmanical connotation was modified by the Buddha to take all men into the fold of Brahmanhood. He is the Brahman who follows the Noble eightfold Path. He is the Aryan who associates himself with the followers of the Sublime Arya Dhamma.

The yellow robed Bhikkhus follow the higher Morality of Psychical Emancipation leading to Nibbana, the white-robed laity follow the above-mentioned ten virtues. Wherever the Bhikkhus went they brought illumination; their lives of renunciation, compassion, activity, became a living example to the people. Thus was Asia civilized. Religion was never forced by the Bhikkhus, for they had no dogma to give, Example and exhortation to lead a noble moral life is quite different from a system of enslavement which posited a terrific god who sits high up in some place in the land of no-

where, whose love could only be found through a selfish, dogmatic, arrogant priesthood, whose god was Mammon. The Bhikkhus taught the people to uphold noble traditions, to abrogate such laws that were unjust and retarded the growth of the national consciousness, to be patriotic, to cultivate arts and industries and to develop agriculture, and to abstain from *sensualising passion*. Slaughtering of animals for food, or for sports, drinking alcoholic poison which developed insanity, destruction of forests, were by moral persuasion stopped. The principles of heredity based on moral environments were taught which made parents to protect the future progeny from ethical destruction. Simple, peaceful, natural, without arrogance the Buddhist peoples lived helping each other, meeting regularly at the Viharas to listen to the Doctrine of the Great Teacher. How peaceful and humane are the surroundings of a Vihara where solitude reigns, its very atmosphere impregnated with the spirit of Buddha's redeeming universal love to all living beings. It is like the manipulating centre of a wireless telegraphic station, whence wireless messages of love and goodwill are continuously transmitted to the ten quarters of the globe, to the realms beyond, up and below. All systems that do not promulgate the virtues of the Eightfold Path are void of Truth. To know the supreme nature of the great Lord of Compassion there is only one way, and that way is to live the life of illumination as set forth in the Satipathana Sutta of the Digha Nikaya. The man who kills, steals, commits adultery, tells lies, drinks alcoholic liquor is destined to suffer. His path is the path of Insanity. Muddle-headed theologians whose only view of life is to enjoy here, and to bask in the bosom of a deity in the upper regions are half insane. Had not materialistic signs advanced as it has advanced to-day, had the theologians retained power as they did in the medieval period, Europe would never have occupied its present place of advantage. Science has come to help man to make him free. Theology fetters the human intellect. What is needed to-day is universal love as

taught by the Buddha, not as is taught by the Semitic prophets and an aristocratic priesthood. It is the all-embracing compassionateness, desiring for the welfare of all living beings, without bloody sacrifice either for man or god. Sacrifice of animals for the god has stopped but in its place a holocaust, a million-fold well-organised has come to stay. The stockyards of Chicago, of St. Louis where the millionaire pork-packers have their hecatombs of tens of millions of helpless animals, slaughtered for the benefit of half-insane, muddle-headed men and women, are embodiments of a vicious teaching, abominably wicked, founded on a semitic paganism. Could these gods help such a people to climb up the ladder leading heavenwards? *It is the reflex of an abominable hell.* Buddhism tells of a heaven joyous where only the kind-hearted, virtuous, morally pure are welcomed. A place fit for the wicked, the unmerciful is the opposite of heaven. The hell of the Buddhist is the heaven of the false religionist whose moral code is so full of immoral ethics. Truth is above wealth, relations and vested interests. All these must be sacrificed for the sake of Truth. What is Truth? It is the Doctrine of the Eightfold Noble Path: the path to eternal peace, to illumination, to wisdom, to Nibbana, where there is no pain, no anxiety, no illusion, no lamentation, no despair, no ignorance, and no illusory hopes. It is the Path that teaches that there is suffering in this life, that this suffering is due to ignorance and to selfish personal desires clinging to a false ego, that this Ignorance can be destroyed and Enlightenment gained in this life in perfect consciousness, and that the way is the Noble Doctrine taught by the Great Master of supreme Wisdom. This knowledge is called the Right Doctrine whose corollary is Right Aspiration which enunciates the principles of a threefold Renunciation, of sensual pleasures, of ill-will, and of non-mercy. A hygienic life of non-alcoholic, non-destructive aesthetic life is the result of Right Knowledge. Right Aspirations leadeth unto Right Speech which knows no harshness, no untruth, no slander, no gossip. Kind, gentle, humane, loving, truthful, profit-

DHYANI BUDDHA,

able, and wise are the words of him who follows the path of Right Speech. Right Speech doth lead to Right Action which consists in avoiding destruction of life, abstaining from unlawful gain, and avoiding the sensualising life of adultery and alcoholism. Right Action is followed by Right Occupation which is the gaining of a right livelihood which consists in abstaining from following destructive professions, such as slave-dealing, dealing in murderous weapons, dealing in flesh, dealing in poisons and in liquor. If Europe could only see the beauty of the grand Doctrine of Humanity there will be no sale of the poisonous abominations which are manufactured in countries supposed to be under the influence of the gospel of Christ. But such a thing is only possible when the people are trained in a more humane doctrine than the semitic morality which is now preached as the best they have. Utterly blind are the statesmen of Europe who are suffering from the effects of political insanity in that they will not see the utter destruction of all that is noble in man by coming under the influence of alcoholism. The poor Chinese for more than a generation had become mental and physical imbeciles, thanks to the higher morality of a Christian nation who for the sake of Mammon forced opium down the throats of the Chinese people, and when they resisted to have it, Christian bayonets were turned against them. For a generation millions of lives were sacrificed for the sake of a filthy lucre. A sober nation following the ethics of a higher religion came to the rescue of the Chinese, and the greedy race had at last to yield and the abominable opium traffic has come to an end. The principles of a higher ethical code condemns the liquor traffic, condemns the use of alcohol on the principles of heredity inasmuch as it affects the future well-being of a race. But the administrators of the governments are in no way concerned about the future of a race. Suffering from the effects of political alcoholism they care no more for the welfare of other nations than a tiger cares for a lamb. And the wheels of the European gods continue to grind slowly crushing the weaker races, making them imbeciles,

feeble-minded and utterly useless. If these Asuras can be brought under the influence of the Good Law of Sanity, we might look hopefully for a better future. To exhort people who are under alcoholic influence and to make them listen thereto, you might as well try to set fire to the Ganges or the river Thames. So much for the evil of alcoholism. It is one of the five evils condemned by the law of Right Livelihood, which is followed by Right Endeavour to avoid the springing up and the expansion of evil, and the exertion to produce righteous impulses and to have them expanded and developed. Here is the human effort vitalised by the noblest virility of Aryan manhood that nought can stop. Let me perish, but let me not give up the noble exertion to master the lower impulses and come out triumphant a victorious hero, fit to receive the homage of gods. Such is the desire of the follower of the Good Law of the Aryan Saviour of Humanity. This is Right Endeavour, which is followed by the intellectual training that gives power to stand firm, unaffected by the tornadoes of sensations, passionate impulses, tactual ideations both objective and subjective, master of the situation, no more influenced by the impediments of sensuality, ill-will, lethargy, irritability, doubt &c. This is the psychological training which Right Knowledge and its corollaries produce. It is called Right Analysis of the fourfold Attentions. His consciousness is now radiant, his mind is now clear, he is no more a creature of sensational impulses, he is free from sexuality, ill-will, lethargic indolence, and other abominations which produce pain. The harvest of his sowing he now reaps in the form of psychical illuminations, in the form of Jhannas, worthy to be the recipient of the homage of men and gods. He is now enjoying the bliss of Nirvanic enlightenment. He knows he is free from all delusions. He has cut off all desires that belong to the cosmic evolution. He is a purified god. This is the Grand Consummation of the Aryan hero.

IMPERIALISM AND IMPERIAL FEDERATION.

BY

PROF. V. G. KALE, M. A.

(Fergusson College, Poona.)

"The idea, then, which I would venture to suggest as governing all other ideas regarding our management of India is this fundamental idea of treating the relationship between us and the people of India as one of hearty comradeship"—Colonel Sir Francis Younghusband.

The British Empire is, indeed, a marvel of modern times, the like of which the world has never seen before. In its extent and population, development and constitution, and in its wealth and resources, it stands in marked contrast with and surpasses similar other aggregations known to ancient, mediæval and contemporary history. The small sea-girt isle, lying in a corner of Europe, at one time a part of one of the mightiest of empires, organised itself, by a steady process of assimilation and consolidation, into a strong and vigorous state and its people began very soon to stretch out their hands to grasp external dominion on land and sea, in Europe and outside it. In the struggle which ensued for mastery among the European nations, England obtained a decisive victory and the fall of Napoleon left her in undisturbed possession of the field. The United Kingdom could thus freely carve out its eventful imperial destiny, and though the Declaration of Independence by the American colonies lopped off a large and rich part of the Empire, the loss has, since then, been more than counterbalanced by the valuable acquisitions made later in India, Africa and Australia. And to-day the Empire stands without a serious rival in its enormous commerce and wealth, the myriads of its varied citizens and its splendid fleet and army.

After the fall of the Roman Empire, Europe relapsed into barbarism and chaos. The traditions of the Empire were, however, sought to be maintained in new environments in Western Europe and at Constantinople. On the conquest of Byzantium by the Turks, the memories of the Empire continued to be . . . and its shadows venerated in

Germany till in 1806, the last Holy Roman Emperor abjured his sonorous but empty title. By the end of the Mediæval period, the European peoples had begun to fall apart into distinct nationalities and were, for two centuries, engaged in the work of consolidation and enfranchisement, political and religious. The process of nationalisation was completed in the last century and the unification of Germany and of Italy represents the last phase of that evolution. This internal movement synchronised with an external movement of expansion and conquest. The European scramble for dominion was transferred to Asia and Africa and to-day every state in the West has its colonies, dependencies and spheres of influence outside Europe. The recent wars waged by France and Italy in North Africa are typical of the European hunger for empire.

These nations have their own peculiar imperial problems to solve and it does not appear that lapse of time will render their solution easier. But as has been remarked above, the British Empire stands out in sharp contrast with the other contemporary empires. The latter are more or less autocratic in their dealings with their colonies and dependencies. The United States, France and Portugal have smaller dependencies to control and though the colour difficulty confronts all the imperial states, whether monarchical or republican, the British Empire has to face certain developments which do not trouble the others. In the case of the British aggregation of states the title of Empire is a misnomer. If the Crown colonies and dependencies are left out of account, that Empire is a federation of independent units very much like the United States of America, where, however, the nationalism and cohesion are more complete. The presence of India among the constituent parts of the Empire is its main title to be called an Empire and this country is by itself an empire within the so-called larger Empire. The Imperial Government has only a nominal hold over the self-governing colonies of Canada, Australia, New Zealand and South Africa, which are practically independent. The bonds which bind them to one another and to the

mother country are ties of common blood and common interest. The old colonial policy which lost England her American children has been replaced by an attitude of friendliness and sisterly attachment. Great Britain has supplied the colonies with capital necessary to finance their railways and industries and with the men and women required to exploit the untapped resources of their virgin lands. The burden of defending them falls upon the mother country which receives no contributions from the colonial treasuries. In return for these services the United Kingdom gets new and expanding markets for British manufactures and outlets for its surplus population as well as the supplies of food and raw materials. Imperialism has latterly been commonly associated with land-grabbing and lust of wealth, with reckless ambition and pride and with militarism and brutality. Hence the word has now got a rather sinister odour about it. The way in which European states have been fighting over the partition of Africa, in defiance of international morality, the indecent scramble that is going on among those nations for the acquisition of dominion and wealth, and the manner in which the helpless inferior races are being driven to the wall and even trampled upon—all this lends strong colour to the contention of those who maintain that modern imperialism is degrading, selfish and immoral. These people assert that modern imperialism has created an aristocracy of speculators, capitalists and bondholders in whose hands wealth has rapidly accumulated and who embroil their states in quarrels in undeveloped countries where they wish to invest their superfluous cash. It is said that the advent of these men in Asia and Africa has brought no civilization, liberty and happiness into those continents and that imperialism is a mere cloak to conceal selfishness, greed and pride. Mr. J. A. Hobson* thus sums up his views with regard to modern imperialism:—"Imperialism is a depraved choice of national life, imposed by self-seeking interests which appeal to the lusts of quantitative acquisitiveness and of forceful domination surviving in a nation from early centuries

of animal struggle for existence. Its adoption as a policy implies a deliberate renunciation of that cultivation of the higher inner qualities which, for a nation as for an individual, constitute the ascendancy of reason over brute impulse. It is the besetting sin of all successful states and its penalty is unalterable in the order of Nature." This is rather hard language, but it will be conceded, not sufficiently hard to condemn the atrocities committed by certain Western states upon the helpless negroes.

This dark picture does not, however, represent every species of contemporary imperialism though some of the ugly spots pointed out above are present there also. Opinions may differ as to whether imperialism is the last word in the progress of human societies or nationalism is the final stage in the healthy growth of peoples. But there can be no doubt that there is a higher and nobler species of imperialism which is calculated to make a notable contribution to the progress of world's civilization. The idea of a universal monarchy and a universal religion has haunted the minds of scholars and philosophers from the times of the Roman Empire. The ideal has, however, been seldom realized and the distinctions of race and nationality have triumphed. Sober-minded British* imperialists assert that their creed is not the glorification of conquest. It has created a system of states which is no longer merely European but cosmopolitan and the field of diplomacy has become worldwide. This, of itself, is not a great advance over the old state of things. Yet an imperialism which honestly seeks to take the torch of knowledge and civilization to the dark corners of the earth and tries to raise the backward races to a higher level of life is a policy that may be commended to the attention of imperial statesmen. Unfortunately the action of imperial statesmanship falls far short of the theory and thus the advantages of an empire become doubtful. The autocratic and irresponsible domination over vast masses of economically inferior races breeds in the rulers a haughty contempt for the noble principles of liberty and justice on which the democracy

* "Imperialism"—A Study by J. A. Hobson.

* The "Imperial Ideal" by Mr. W. F. Monypenny.

at home is based, while the subject populations get no scope to rise from the depressed condition in which they find themselves sunk. By a combination of superior genius for organization and material advancement and good fortune, the British race has built up a vast empire and the question that confronts the British people is, shall they allow it to drift where it may or shall they make efforts to promote its unity, strength and prosperity? A sense of imperial responsibility has been created in the mother country and the colonies and they are laying their heads together to concert measures for the purpose of common defence and mutual assistance. Apart from what are called little Englanders, who look upon colonies as encumbrances and ripe fruits falling from the tree, and others who believe that imperialism is an undesirable ideal for a nation to place before itself, there are many who take the Empire seriously and wish well to it, but at the same time, disapprove of the coercive and selfish measures which are associated with imperialism. They agree that the British Empire has a noble and a notable part to play in the history of civilization by maintaining the cause of peace, justice and humanity in the world but they do not believe in imperial unity secured by artificial ties. They would leave the integral parts of the Empire free agents to evolve their own destiny along their own lines and would control even a dependency like India only so far as her interests require such external restraint. They do not speak of accretions of territory and financial gain as assets of the Empire but emphasise its potential beneficial influence that may be exerted all round. The two political parties in Canada recently fought over the issue of the reciprocity agreement with the U. S. A., with the result that the proposed treaty is now shelved for an indefinite period. Mr. Borden's victory is regarded as a triumph of imperialism and Canadian nationalism at one and the same time. It was really the bogey of eventual absorption of Canada by the United States, partly justified by the past neglect of Canadian interests by the Imperial Government, which brought about the fall of

Sir Wilfrid Laurier. That liberal statesman and those who think with him in Canada and the United Kingdom, feel that a more convenient fiscal arrangement between the two contemning nations need not affect the relations between Canada and the mother country. While the British Liberals are sorry that the proposed Reciprocity Agreement which would have led to freer and more profitable trade between Canada and the United States should have been rejected by the electors in the dominions, they congratulate the Canadians, who are a mixture of English and French settlers, upon their national solidarity and deep attachment to the British Empire. The Conservatives charge their opponents with a lack of patriotism and fore-sight and with a cosmopolitanism that would sweep off all national distinctions. The readiness of Liberals to give self-government to Ireland and even to Scotland and Wales enforces still further the divergence of views held by British politicians on the Imperial among other questions.

Despite this divergence of opinion on the Imperial problem the brains of British thinkers have long been engaged in evolving schemes for the proper organization of the scattered members of the Empire into a united whole. Leaving the colonies to take care of themselves and contract alliances with foreign powers, is not a policy that could meet with general approval. The Federation League began its agitation twenty-five years ago and preached the doctrine that the resources of the Empire ought to be combined for common defence and all the parts which have their share of imperial burdens, must have a voice in the control of imperial expenditure and imperial policy. Since then positive proposals have been made and discussed* and the agitation in favour of an imperial federation has become more active after the experiences of the Boer War. It is contended, in the first place, that the burden of the business which the British Parliament has got to rush through has become so heavy that it is almost impossible for it to discharge its legislative duties effici-

* "Problems of Empire" by the Hon'ble T. A. Bramey.

ently. The Parliament has to look to the purely local affairs and then to those of Ireland, of the colonies though they enjoy self-government, and of the dependencies, and thus its control of the Empire is naturally slack and ineffective. Secondly, the existence of the British Empire depends upon the maintenance of the sea-power. The mother country has to defend its colonies and dependencies and to keep up a large and costly fleet. The colonies make no contributions towards the expense of the Navy which the British tax-payer has to bear. It is but justice which requires that in return for the protection they receive, the oversea dominions of the Crown should contribute their own share. But this taxation, though it may be cheerfully borne by the colonies at the outset, may in course of time, be regarded as an exaction. Then again, the colonies may not agree with the mother country with regard to the propriety and need of certain items of expenditure undertaken by the Imperial Government. They will demand an adequate representation in the councils of the Empire. On these grounds an imperial council or federal assembly, in which the various parts of the Empire will be represented, has been proposed. The question was discussed by the last Imperial Conference also. There are obvious difficulties in the way of inaugurating such a federal assembly. The long distances which separate England from the outlying parts of the Empire, the difficulty of apportioning the contributions to be made by each, and the questions that must be submitted to the council without embarrassing the position of the Foreign and Colonial offices, are some of these difficulties. However desirable a federal union may be, the obstacles in the way are too serious to be brushed aside. Mr. J. A. Hobson asks, "But how can the White democracies of Australia and North America desire to enter such a hodge-podge of contradictory systems as would be presented by an imperial federation, which might, according to a recent authority, be compiled in the following fashion: first a union of Great Britain, Ireland, Canada, West Indies, Australia, Tasmania, New Zealand, Newfoundland, Mauritius, South Africa, and

Malta to be followed later on by the admission of Cyprus, Ceylon, India, Hongkong, Malayasia with an accompaniment of semi-independent states such as Egypt, etc."* The federation is likely to be too unwieldy for efficient action and may probably give rise to serious complications which can be easily foreseen.

Thus the problem of imperial federation or a closer imperial union on certain definite principles bristles with enormous difficulties. Yet it is generally felt in the United Kingdom and the self-governing colonies that something must be done to obviate the inevitable disruption which will overtake the Empire if matters are allowed to drift. Since the Boer War, which evoked a spontaneous outburst of imperial loyalty throughout the colonies and dependencies and which demonstrated the urgency of a closer union of hearts, heads and hands, the imperial sentiment is growing stronger every day. Imperial conference after conference, in which the Prime Ministers of the colonies have conferred with the representatives of the mother country on subjects of common interest such as those of defence, communications and treaties with foreign powers, have served to keep the question fresh before people's eyes. Not only sentiment, but self-interest also, has made a United Empire an urgent necessity. The Australian Commonwealth with no means of self-defence and the yellow peril always haunting its mind, stands badly in need of naval assistance. The other colonies are similarly exposed and must needs look up to the mother country for means of defence. Conscious of this condition of helpless dependence they have offered to make contributions to the Imperial Navy and the question of maintaining a standing armament in the Eastern waters has been mooted. The mother country too wants the co-operation of the oversea dominions to share the growing burden and responsibilities of the Empire. For the past decade Mr. J. Chamberlain has been a strenuous advocate of the cause of imperial unity which, he believes, may be brought about by means of preferential tariffs within the Empire.

* "Imperialism"—A study by J. A. Hobson.

Mr. Chamberlain maintains that the opening years of the present century saw the end of one chapter in the history of the British Empire, that with the Peace of Vereeniging the era of expansion was definitely closed and that it is high time to think seriously of consolidation. He observes:—"The future of the Empire lies henceforward, not in its power to annex new territories, but in its capacity to unite existing dominions and develop existing resources." This is a more humdrum, but not a less difficult task. To it all our efforts should be directed whilst the nations that compose the Empire are still plastic, and before the growth of distinct national characteristics and divergent national interests has proceeded to such a point that what is now possible has for ever become impossible, and opportunities which are still within our grasp have finally passed away.* He points out what is now a commonplace of political study, that the territorial expansion of the British Empire was, in the main, a hap-hazard affair. Luck favoured the genius of his race in the extension of the Empire, but luck is too fickle to be relied upon and he calls upon his countrymen to face the issue squarely. He sums up the problem in these words:—"We have been, on the whole, wonderfully fortunate, but we cannot trust for ever to good luck. Success breeds envy; jealous eyes watch our progress, measure our strength or weakness, and seek out the joints of our armour. We are great in territory, strong in numbers, and rich in vast but undeveloped resources. But our union is of the slightest, and our development has scarcely begun. Are they also to be left to chance? Are they also to be the blind sport of forces which we but dimly understand and do not seek to control? Or is an effort to be made to find, and having found to pursue, a common policy by which the development of each may be made to serve the interests of the whole, and the strength of the whole to safe-guard and promote the development of each?"†

This, in a nutshell, is the imperial problem, presented by the "Missionary of the Empire," who preaches that the Empire cannot be held together by mere sentiment, which must be supported by something more solid, i.e., preferential tariffs, binding together the various members with commercial ties to the exclusion of foreign rivals. Now, it may be said, this imperial federation or union is all very fine; but what is the position which will be assigned in it, to this country? India is only a dependency, albeit the largest and the most populous of all the portions of the Empire. It may be regarded as a crown colony with no responsible self-government such as is enjoyed by Canada, Australia or South Africa. India's present and prospective status is viewed differently by people of different principles. The maxim most popular with one set of politicians is that India has been conquered by the sword and with the sword it must be maintained. They make no secret of the doctrine that the resources of this country must be at the disposal of its rulers and even the thought of educating and training its people to take their proper share in the administration of its affairs is intolerable. This line of thought represents the crudest form of imperialism found in vogue in the dependencies of some foreign European nations like Java or the Dutch. There is another school of imperialists who think too much of their own civilization and greatness to have any sympathy for the people of the dependency. Loaded with the "white man's burden" they would ever maintain their paternal domination over the subject races alleged to be constitutionally incapable of self-government, for the latter's benefit. Their imperialism is the glorification of conquest and the means of benefiting the predominant power in a variety of ways. Under it no political privileges can be conferred on the ruled as the country is to be governed for them from outside. A more liberal view is taken by a few broad-minded and sympathetic statesmen who regard the Indian heritage as a trust and have a high sense of their responsibility towards this dependency. They believe that it is the sacred duty of the British nation to govern India solely

* Preface to "The Case against Free Trade" by Dr W. Cunningham.

† *Ibid.*

in its interest and gradually to prepare its people for self-government. These high-minded and altruistic statesmen are charged with being silly sentimentalists and impractical day-dreamers—a charge which a closer examination of their position does not sustain. They know it would be a blunder, a crime for England to leave the Indian people to shift for themselves, a prey to internecine quarrels and to external foes. But they would educate the people and gradually train them for self-government and are prepared ultimately to stand aside or retire. This would be the noblest achievement of the British race, thoroughly in harmony with its best traditions.

To the selfish, narrow-minded imperialist, the idea of India standing on the same level as the self-governing colonies in any scheme of federation must, of course, be inconceivable though she may perhaps be represented therein by its government. Others think that her position as a dependency makes her representation in the Imperial Council superfluous or impossible. She therefore stands where she is, federation or no federation. Some of those, however, who know the Indian people, their intelligence, loyalty and the progress they are making, are of opinion that though the immediate granting of self-government and representative institutions would be premature, India ought to take a conspicuous place in any imperial assembly that may be formed. Thus Sir Charles Crosthwaite, K. C. I. E., observes:—"If Mr. Chamberlain's scheme for tariff reform or for preferences to our Colonies and Dependencies ever comes to anything, India will have to be dealt with on the same terms as the colonies. That is to say, she must enjoy equal fiscal freedom with them and be allowed to work out her own salvation. Moreover, should a Council or Conference of the Empire be called hereafter, she cannot be excluded from it..... There are men in India of high birth and sober, reflecting statesmanship who would adorn a seat in such an assemblage and whose advice would be of real value." And further:—"In conclusion I would observe that in any scheme of imperial federation India is bound to take a conspicuous place. Dependency

though she is, she, is a great country—a country whose greatness is growing..... The greater her independence, the more she will be able and willing to do for the Empire at large. It is for us to see that the rightful position of India is recognized and accorded to her."* This is the proper and statesmanlike view for Great Britain and the Colonies to take with respect to this country. Its ancient civilization, its strategical, military and commercial value to the Empire and the loyalty of the three hundred millions of its people to the British Throne entitle it to a position of equality among the component parts of an imperial federation. Unfortunately, the self-governing colonies, proud of their independence and haughty in their isolation, are not inclined to admit India to a place by their side in an imperial union. At one time their attachment to the mother country was an object of doubt and uncertainty and they might have allied themselves with or been merged into their foreign neighbours. This attitude has been definitely changed and their loyalty to the Empire is now an undoubted fact. The treatment which the colonies, in defiance of the mother country, accord to Indian British subjects shows that they are not prepared to regard the latter as members of an imperial union. The humiliating restrictions which are placed upon Indians in South Africa, Canada and Australia, the helplessness of the Imperial Government to put a wholesome pressure upon colonial legislatures in the matter and the fact that the Government of India has been compelled to resort to measures of retaliation against South Africa are not hopeful features of the proposed imperial federation. If one member of the Empire finds it necessary for its interest and in defence of its rights, to retaliate against another, the prospect of a union is indeed far from cheerful. If the federation or union is to be a reality and not a mockery, this attitude of the self-governing colonies towards non-white subjects of the Empire must undergo a material change. In view of this illiberal and

* India: Present and Future in 'Empire and the Century.'

selfish imperialism of the colonies one is inclined to despair of a genuine unity and believe in the prophecy that "the notion that the absence of any real strong identity of interest between the self-governing colonies and the more remote and more hazardous fringes of the Empire can be compensated by some general spirit of loyalty towards and pride in "the Empire," is a delusion which will speedily be dispelled."* This may be true of "the more remote and more hazardous fringes of the Empire," but certainly not of India, the heart and the most invaluable asset of the Empire. But the colonial feeling is there and is the greatest impediment to an imperial union.

The attitude of India itself is simple and clear. Her attachment to the British Throne and the Empire is unquestioned and her aspiration to take its legitimate share of the rights and responsibilities of the Empire is being made a grievance against her educated people. They are conscious of the blessings conferred upon India by British rule and the opportunities presented to them of self-advancement. The spread of Western education has aroused in a large section of the Indian population high aspirations about its future. There are impatient idealists everywhere and India has its share of them. But India's ideal of becoming a self-governing element of the British Empire has now been definitely recognized and avowed by its responsible representatives, who hope one day, however distant the time may be, under British guidance, to reach that cherished goal. No one who knows the conditions of India would suggest that "self-government should be immediately introduced here. But at the same time Indian public opinion does not subscribe to the view that India is constitutionally unfit for self-government and would never be in a position to rule herself. It desires that steady progress should be made by safe instalments towards the colonial ideal. While characterising the idea of transplanting British institutions wholesale into India 'as a fantastic and ludicrous dream,' and giving universal suffrage in India and insisting "that India should be on the same footing as our

self-governing colonies like Canada"† as preposterous, Lord Morley did yet give us his famous reforms, which form an important instalment of constitutional right. We cannot do better than quote here what the Hon'ble Mr. Gokhale said in this connection while addressing a British audience. He observed:—"The goal which the educated classes of India have in view is a position for their country in the Empire worthy of the self-respect of civilized people. They want their country to be a prosperous, self-governing, integral part of the Empire like the colonies, and not a mere poverty-stricken bureaucratically held possession of that Empire."‡ This statement admirably sums up the feelings of Indian people in the matter of the position they would desire to occupy in an imperial federation. Mr. Gokhale added that "of course, we recognize that the new self-government has to be on Western lines, and therefore the steps by which the goal is reached, must necessarily be slow, as for the advance to be real, it must be from experiment to experiment only." In any project of an imperial union this sentiment will have to be taken into account and the consent of the Government of India and of the people of this country cannot be assumed as a matter of course or of no moment. We have shown above that the feeling in the colonies and in many quarters in the mother country also is antagonistic to this view and until it undergoes the desired change no genuine imperial union or federation is conceivable. After all, such an organization must be based upon sentiment and enlightened self-interest in the component elements and an arrangement which appeals to neither, in India, is unthinkable.

* Morley's Indian Budget speech

† The Hon'ble Mr. Gokhale's paper on Self Government read before the East India Association.

TORU DUTT.*

By MR. P. SESHADRI, M. A.

IN addition to the immense biographical interest attaching to the pathetic career of this gifted woman whose life extended over about only a score of years, her work as a poetess is of great importance to one aspect of recent Indian literary history. Success in an alien language and that within a short period of existence is a feat which may stagger the wildest of literary dreamers. Early efforts in opening new paths at the clashing point of two great civilizations are eminently instructive and useful to succeeding workers by the guidance and help afforded by them. The achievements of the past are the hope of the future and nothing is of greater curiosity to a student of literature than the means by which he may be able to forecast the strange developments a nation's mind may show in its artistic expression—either in form, or in spirit.

An Indian woman who visited foreign lands, who drank deep at their fountains of culture, and who closed her fragile life of Sorrow and Song, with a period of intellectual production, devoted to the interpretation of the spirit and civilization of her country, leaving behind monuments of poetic genius that have won the approbation of competent critics and students of literature—*she* must be an object of affectionate study and loving recognition for at least her own countrymen.

The introduction of English literature and the enthusiastic adherence it has been receiving from the sons of the intellectual aristocracy of this country, the increasing importance that is being shown to it in the *Universities*, combined with the peculiar circumstances that have been strengthening its hold and influence on the people—these set one thinking of their probable effects on Indian attempts at literary expression in English. The best talent of the country is fed on the classical productions of English masterminds in all the branches of literature.

The longing for artistic expression, inevitable in all cases where there is anything like creative genius, must find its vent through some medium. An impartial investigation into the special circumstances of this country is sure to convince us of the fact that English will play in the Indian Education and life of the future, a more and more prominent part, than even the present extensive scope, which it is its privilege to enjoy. The capacity of the Indian of the present day for wielding the English language has drawn the genuine admiration of foreigners. This ability is seen not merely in the Indian orator's remarkable success on the political platform, but also in the regions of pure literary composition, even in poetry, which may be considered its chosen ground.

The question of the possibility of a nation acquiring mastery over an alien language, when separated by differences of race, religion and civilization, to such an extent that it may be able to produce even poets—this problem raises a number of issues which it is not possible to discuss here at any length. There is, it is true, the example of the early history of Spain in the days of Roman occupation, when there was the spectacle of people of Spanish descent like Seneca, excelling as Latin dramatists and poets. The case is not however quite parallel to the circumstances of this country as the Spanish absorption of Roman manners, religion and civilization was absolute and left no yawning gulfs. But this much may be ventured upon after a study of the conditions in this land. There is no use denying poetic genius to a great nation, which has enriched the world's literature with some of its most cherished monuments of Art. The absorption of the English language has been carried to a remarkably fine degree and is every day advancing towards perfection. Barriers of race, religion and civilization cannot effectively stifle creative genius, if it has a strong impelling force behind it. After all, this absence of absorption is likely to affect only the perfect acquirement of foreign colloquialisms, the vernacular richness of humour and epigram, the realisation of dialectical vividness and the presentation of the natural

* These are but detached pieces of a long sketch, published separately in book form.

flow of conversation in the language—virtues which however valuable in themselves, are not always essential to literary success, and on which moreover no demand is made in some of the most prized branches of literary craftsmanship. The encouragement given to the English language in this country, and the wide public the medium secures, combined with the illimitable capacity of the nation to produce men of genius—these must be able to annihilate all obstacles, which are not really of the exaggerated dimensions, ignorance and pessimism would make them out to be. There is abundance of material for poetic treatment in India, in its superb natural beauties, its marvellous history and legend and in its mystical religion and philosophy, not to speak of its multitudinous problems, assuming shapes and features unknown to all the past ages of the world. The prosaic scenes of Anglo-Indian life have furnished material for the poetry of Rudyard Kipling; a foreigner in the land,—Sir Edwin Arnold—has striven with remarkable success to depict the religious and philosophical spirit of its people; Sir Alfred Lyall, Laurence Hope and others have achieved similar success. How much more easy should it be for the Indian who is imbued with Western culture and has acquired mastery over the English language, to interpret his country and civilization in the garb of the English Muse, if he has only real creative genius for the poetic art!

The success which Toru Dutt and a few others have achieved in the past, inspire one with strong hopes and it is not too much to expect that in the near future, England and India will be united in inseparable bonds of intellectual kinship. This belief is widely shared, as may be seen from the fact that Lord Curzon, in a speech before the Society of Authors in England, ventured to prophesy that in course of time, a society of Indo-English authors may meet at the capital of British India. If there is the possibility of literary prognostication with any success, it may be said that there will spring up a class of Indo-English poets in the future who will do for the poetic interpretation of India what

Longfellow, Lowell and Walt Whitman have done for America.

II

The work of the poetess who forms the subject of this sketch has received recognition at the hands of a critic of the eminence of Mr. Edmund Gosse and she is chiefly remembered as the author of a volume of English verse, entitled *Ancient Ballads and Legends of Hindustan*, the first edition of which was published in 1881, by Messrs. Kegan Paul Trench and Co., with a sympathetic biographical memoir from the pen of the English critic. Dr. Richard Garnett has accorded her the rare privilege of including some of her *Ballads and Legends*, in the volume of *Hindu Poetry* in the *World's Classics*.

Toru Dutt, or Thorulata Dutt, was born on the 4th March 1856 in Calcutta and if Providence had not deprived this country of her valued life, she should now have been a poetess in the full meridian of her splendour. One could fondly imagine that she might now have stood forth as a glorious literary personage of the first rank, crowned year after year by the rapturous applause of all the English speaking world. She came of a very respectable and gifted family, the Dutt of Rambagan in Bengal, being the daughter of Babu Govind Chandra Dutt, himself a poet of some ability, as well as his brother Sashi Chandra Dutt, a Raj Bahadur and Justice of the Peace. Babu Govinda Chandra was a pious Christian and always displayed a remarkable vigour of intellect, breadth of sympathies and saintliness of character. The Dutt brothers,—whose nephew was the distinguished Indian statesman and man of letters, the late Mr. Romesh Chander Dutt—were educated at the Hindu College, Calcutta, and had a striking talent for poetry as may be seen from the whole library of *Sorrow and Song* put forth by them.

Toru was the youngest of three children, all short-lived like herself, the eldest, a brother Abin dying at the age of fourteen, and the other a sister Aru, who was her intellectual companion nearly all her life till removed by death at twenty, three years before her own end. Born in a specially enlightened and

gifted family, she had the inestimable boon of a good home-training, the like of which rarely falls to the fortune of a young boy or girl. The father was admirably fitted by his intellectual endowments and sterling character to guide the development of this child who must have shown unmistakable signs of genius, in its very early years. Toru's father devoted his personal attention to her education and he was actively associated with his two daughters in their early studies. The impulse for a love of English Literature seems however to have come from her brother's tutor, Babu Satis Chander who first imparted it to the younger members of the family. There was soon the remarkable phenomenon of two Indian girls who were scarcely in their teens, deep in the beauties of *Paradise Lost*. She was scarcely thirteen when the father took the two daughters for a course of travel and education on the continent of Europe. The death of Toru's brother made the father centre all his hopes in his daughter. A stay of four years, first at school in France and later in Italy and England, including attendance at a course of lectures at Cambridge served to equip Toru with the best culture of the West as is evident from her literary activities in the languages of England and France which reveal a striking back-ground of European learning in general. She did not lose touch with the life and civilization of her country, though as she says in her *Ballads and Legends*, she was

Far away

In distant lands, by many a sheltered bay
When slumbered in his cave the water-wraith
And the waves gently kissed the classic shore
Of France or Italy, beneath the moon
When earth lay tranced in a heavenly swoon.

The acquirement of European culture and the treasures of the English language in their very native homes must have exercised a profound influence on her.

The winter of 1873 saw them back in their Idyllic home in Bengal and all Toru's activity is confined to the last four years of her life, spent amidst the surroundings of her early years, where,

The light green graceful tamarinds abound
Amid the mango clumps,

under the very trees associated with the sweet sports and companions of childhood. She has described the surroundings of her home :

Far and near Kokilas hail the day;
And to their pastures wend our sleepy cows;
And in the shadow, on the broad tank cast
By that hoary tree, so beautiful and vast
The water-lilies spring like snow enmassed.

To her mind, already replete with Western learning, there now came a knowledge of Sanscrit literature with all its fathomless depth and profound mystery.

The family of the Duttas lived a life of reserved solitude and she had absolutely no opportunities of mingling with Calcutta Society. Anglo-Indians had no knowledge of the existence of such a blossom in their midst. When her literary contributions became known, the conjecture was ventured that it was some Anglo-Indian author who had chosen the Indian *nom-de-plume* as a prank.

* * *

The Ancient Ballads and Legends by which work she is most well-known, was not given to the world during her life-time, as also a tragical romance of hers in French entitled "*Le Journal de Mlle D'Arvers*," a story turning on the ungovernable passion of two brothers for a placid and beautiful girl, a passion which leads to fratricide and madness.

The acute and wasting illness of consumption brought her down to the sick-bed early in 1877, and after a period of protracted physical agony—which recalls to our minds the last days of Keats, whose life has many points of resemblance with that of this unfortunate young lady—she died on the 30th August when she had known the glories of the earth for only twenty-one years and six months.

III.

In her *Ballads and Legends of Hindustan* she has successfully striven to interpret the spirit of the East to the West. Tales of ancient Hindu life and mythology are narrated in poems alive with profound sympathy and enthusiasm. Hindu ideals of life and character are presented with force, animation and vigour. The cycle of nine legends and ballads strung

Drona exclaims in admiration of his heroic conduct and unflinching adherence to truth:

Fame shall sound thy praise from sea to sea.

Lakshman portrays the ideal Hindu brother, ever loving and dutiful, seeking glory in faithful service, "in life-long loyalty and truth." It is the story of his being forced by the unwarranted and unkind insinuations of his brother's wife, the heroine of the *Ramayan*, to leave her in the forest home which resulted in all the later developments of the Epic.

Prehlad depicts the boy-devotee braving the wrath of a tyrant father in his attempt to vindicate "The true God's name and power."

There is again the boy chafing under the ill-treatment of his royal father, who is under the control of a more favoured wife than his mother. He longs to attain

Far, far above the highest of this ^{a place} earth
and succeeds by prayer and penance in getting
imperishable renown. He

The highest heavens and there he shines a star ^{gained at last}

This is the legend of *Dhruva*.

Sita is a sketch in a few lines of

Three happy children in a darkened room,
listening enwrapped in sympathy to the ancient
tale of the troubles of the heroine of that
name, sung by their mother:

Tears from three pairs of young eyes fall amsin
And bowed in sorrow are the three young heads.

An emperor who has renounced the world to lead a *Sanyasin's* life is drawn in love and attachment to the young of a hind, rescued by him from death, which absorbs his care and attention to the detriment of his sacred rites and penances. This is woven into a delicate and human poem, the *Royal Ascetic and the Hind*.

One of the most stirring poems of the series is *Jogodhyn Uma*, an original creation of hers in which the Goddess Uma reveals herself in a divine vision to a priest—a story characteristic of popular Hinduism. A pedlar is hawking his treasure of shell bracelets:—

Pellucid spread a lake-like tank
Beside the road now lonelier still,
High on three sides arose the bank
Which fruit-trees shadowed at their will;

Upon the fourth side was the Ghaut,
With its broad stairs of marble white,
And at the entrance-arch there sat,
Full face against the morning light,
A fair young woman with large eyes,
And dark hair falling to her zone,
She heard the pedlar's cry arise,
And eager seemed his ware to own.

The bracelets clasp her slender wrist and she directs him for the payment of their value to the priest at the adjoining temple, whose daughter she professes herself to be. When the incidents are communicated to the priest by the pedlar, there is at first surprise at the mention of a daughter, when he has none and later on a consciousness dawns upon his mind that she must be Uma whom he has worshipped for years. They hasten to the bathing Ghaut and on the prayers of the priest:—

Sudden from out the water sprung
A rounded arm, on which they saw,
As high the lotus buds among
It rose the bracelet white, with awe.
Then a wide ripple took and swung
The blossom on that liquid plain
And lo! the arm so fair and young
Sank in the waters down again.

A few miscellaneous poems are appended to the volume from which may be singled out for appreciation, the stanzas on *France*, the sonnet on the *Lotus*, and the noble poem full of the reminiscences of her early life, *Our Casuarina Tree*.

IV

The lays are steeped in Hindu sentiments and breathe throughout the spirit of Hindu tradition and Hindu thought. Her poetry is essentially of her race and her country. There is not in her work, at least in her *Ballads and Legends*, the vain attempt to give an 'exotic setting to her songs, or delineate thought alien to the culture and civilization of her country. Now she indulges in giving vent to the fatalistic doctrines of the popular philosophy of her nation:

It is my destiny,
O fear not thou, but pity one
Whose fate is thine to die

or exclaims with world-weariness:—"Life is a shadow vain." Consolation is sought to be given by the doctrine of *Karma*, as where

Dhruva's mother attempts to reconcile him with his low position in life :

The ivory throne, the umbrella of gold,
The best steed and the royal elephant
Rich caparisoned, must be his by right
Who has deserved them by his virtuous acts
In times long past. Oh think on this my son
And be content.

There is the belief in omens :

Hearse the vulture screamed,
As out he strode with dauntless air,

she says, referring to Lakshman's departure.

Now it is the Hindu matron reciting to the group of her beloved children :

An old, old story, and the lay,
Which has eoked Sita from the past.

or,

A prose chronicle writ of old
By Brahmin sage.

It is significant that she should excel in depicting the finer graces and nobler attractions of womanhood rather than in delineating pure, sensuous beauty. The highest praise she can bestow on Savitri's charm is :

But the good
God's purity there loved to trace
Mirrored in dawning womanhood.

She loves woman, "in the meek grace of virginhood."

She is full of emotion, and Love's ethereal sphere is all her own. Here are the magical effects of Love :

She went away
Leaving her virgin heart behind
And richer for the loss. A ray
Shot down from heaven, appeared to tinge
All objects with supernal light;
The thatched had a rainbow fringe,
The corn fields looked more green and bright.

She has described how the fount of Love springs out anew within a blighted heart; she knows the rapidity of Love—as swift as a lightning flash. She sings that "when the heart-rose opens," it can never shut. Her range of sympathies is so wide that she can shed tears of sorrow and anxiety for

A wren
That sees the shadow of the hawk
Jail on—and trembles in affright.

She is drawn in love to a pair of doves,

Picking a living in our sheaves,
And happy in their loves,
Near amid a poplar's quivering leaves,

The story of the *Royal Ascetic and the Hind* is an exquisite study in tenderness of feeling and pathos. She administers a gentle rebuke to the stern ascetic author of the *Vishnu Purana*—from which this story is taken—who would imply as the concluding moral of his tale, that for the hermit king, it was a sin to love his nursing.

When she sees that,

The hind was at his side, with tearful eyes
Watching his last sad moments, like a child
Beside a father,

her heart goes out in absolute sympathy to the *Sanyasin* who in direct disregard of the principles of his monastic order

Watched and watched
His favourite through a blinding film of tears,
And could not think of the beyond at hand,—
So keen he felt the parting, such deep grief
O'whelmed him for the creature he had reared,
To it devoted was his last, last thought,
Regardless of present and of future both.

The review of Toru's poetical work is over. The delicacy and lightness of touch displayed in her verse bear testimony to her faultless and refined poetic tastes, and the music of her poetry is not the least negligible feature of her work. She cannot be accused of want of simplicity and her verse is a spontaneous outburst from beginning to end—a virtue which is perhaps the fundamental requisite of all true poetry. Critics are bound to acknowledge the existence of these and similar merits in her work and they cannot in any fairness deny the term *poetry* to verse of such a superior rank.

"It is difficult to exaggerate," says Mr. Edmund Gosse, "when we try to estimate what we have lost in the premature death of Toru Dutt. Literature has no honours which need have been beyond the grasp of a girl who at the age of twenty-one and in languages separated from her own by so deep a chasm, had pro-

duced so much of lasting worth."* It is a privilege for Indian students to read his assurance in the last lines of his introduction to the *Ballads and Legends*, "When the history of the literature of our country comes to be written, there is sure to be a page in it dedicated to this fragile, exotic blossom of song."

There is no necessity to plead for indulgence, in the critical estimate of the poetical work of a person who like the hero of *In Memoriam*, "perished in the green." The poetical treasure bequeathed by her is too valuable to sink into oblivion and she has established within its short compass, many of the essential virtues of a genuine poet. She is one of those "inheritors of unfulfilled renown" as Shelley calls them, and India will always continue to cherish with love, the memory of this "half-blown floweret" of song.

ON READING TORU DUTT'S ANCIENT BALLADS AND LEGENDS OF HINDUSTAN.

With loving rapture have I heard her lyre,

The simple music of its noble song,

The sweet and tender notes that bear along
Her fancy's flight to realms that bards aspire.

The lays of ancient deeds with hope inspire

The heart that sorely needs reviving life,

When called to face the deadly, trying strife
Of Duty's stern command with man's desire.

She set her gaze on Life while she had breath

And sang with fervour all its woes and joys;

The gifted Muse of song had scarce revealed
Her loveliness—when ah! the tyrant Death,

Stilled with ruthless hands the lyric voice,

And plucked the blooming bud from Poesy's field.

P. S.

* Mr. Gosse says in a letter to the present writer, "I am very glad that the memory of this pure and delicate poet should be kept alive in India. Her early death was a great misfortune, especially as her power in expressing in English—a foreign language to her—was astonishing, while yet her interest in the religion and philosophy of her own ancient race was vivid."

SOME ASPECTS OF INDIAN COMMERCE AND INDUSTRY.*

BY G. FINDLAY SHIRRAS ESQ., M. A., I. E. S.
(ON SPECIAL DUTY.)

Finance Department, Government of India, Calcutta.

THE title which I have chosen for this paper admits of numerous forms of treatment. I might describe to you the vast trade of this great empire—an empire which is a land of many countries, I might dilate on the numerous expansion of Indian trade during the last few decades especially with Great Britain, the United States, Germany and China. I am, however, not to expatiate on this topic except incidentally. My aim is rather to devote myself to Indian industrial developments and to the question of Indian tariffs. My chief aim is to show how the future of India is inseparably bound up with its industrial developments. India will require in the near future a systematic development of its resources and the organisation of a trained industrial population. After one tours in all parts of India, he cannot but come to five conclusions:—

Firstly—That India perhaps more than any other country in Asia is in the throes of a great transition and this transition is marked in questions affecting industrial developments. The village in India is no longer a self-contained economic community and the impact of the West is responsible for this change. In Bengal, Madras, Bombay and in the United Provinces one sees vast industrial enterprises being undertaken. India's wealth is now, if ever, being produced by the organisation of industry. Organisation has been seen to be imperative; the industrial regeneration of India can be effected by no other means.

Secondly—Agriculture is and must remain by far the most important of Indian industries and

* Prepared for the Indian Industrial Conference.

wealth have just been tapped while the others (pre eminently among which are India, Servia and Roumania) had an *effete* industrial organisation which was now being displaced by a more up-to-date organisation that will go far to make competition fairer. Again, there is an increase of wealth to the owners of land and to workers themselves, as well as to capitalists. Australia fully realising the truth of this, willingly pays to Great Britain annually Rs 23 crores as interest and she has but 40 lakhs of population—and 1/100th part of the accumulated wealth of India. Some may argue that so far as the excess of exports over imports represents interests on capital invested no objection can be taken. It was to the sum paid owing to India's political connexion that exception is taken. The sum is no longer Rs 27 crores but Rs. 9½ crores.

Payments in connexion with Civil Departments in

India	Rs 26 lakhs
Army and Marine effective charges ..	127 "
India Office .. .	32 "
Furlough allowances . . .	127 "
Pensions and gratuities . . .	666 "

Rs. 9½ cr

This sum of 9½ crores is not tribute because a tribute is payment exacted without equivalent services but this sum in question is a payment for work done, for services rendered. As a distinguished Indian (Mr. Justice Ranade) said addressing his own countrymen, "It cannot well be a mere accident that the destinies of this country have been entrusted to the guidance of a nation whose characteristic strength is opposed to all our weaknesses, whose enterprise in commerce and manufactures knows no bounds, whose capital overflows the world, whose view of life is full of hope, and whose powers of organisation have never been surpassed."

Let me say a few words more as Parthian shots. Great Britain's credit enables India to borrow in the money market on terms which she could not do otherwise and this saving more than compensates for the cost of service. Japan with all its infinite capacity for taking pains, and with all its hard study of that branch of economics (which is called Finance) cannot borrow so cheaply as India. Japan pays for her loans 8 per cent, while India were she independent could not borrow at a lower rate than 6 or 7 per cent. This saving of 2½ per cent on her present permanent debt would be a little over 9 crores of rupees, equivalent almost to the sum which forms the Home charges for the services which India receives. Again India enjoys free of charge the use of the Ambassadors as well as Consuls of His Majesty's Government, throughout the world. This huge saving cannot be estimated with accuracy, but it is indeed great. Lastly India enjoys the services of the British Navy. The Navy costs some Rs. 44½ crores a year (for 1909 the estimates were Rs 54 cr.) India contributes but a modest lakh. At the same time we admit with the heartiest satisfaction and deepest sense of pride that the Indian Army is a source of strength to the British Empire, when, however, we total up the debits and credits we certainly find India receives more than she gives. I hope then that this, although one of the most curious of paradoxes, will appear to be one of the most transparent of fallacies.

INDUSTRIAL DEVELOPMENT

I come now to the question of industrial development and though I shall treat it briefly, I hope I shall not be considered dogmatical. The development of industrial undertakings and industrial education is certainly one of the foremost of administrative problems, especially in those provinces where there are rich resources not yet systematically developed and where too unfortunately there is little aptitude or enterprise shown in utilising

them. Gentlemen, we must not be blind to this principal cause of the failure of Indian industry. There is an awful lack of enterprise in agriculture, hand-loom weaving, sugar production, oil-pressing, not to mention the production of manufactured articles of a complex character. Cotton weaving, *e. g.*, is conducted on archaic and exceedingly wasteful lines. I have already referred to Indian agriculture and it being the principal industry of India no consideration of the industrial development can be complete without a reference to a topic which roughly requires special treatment.

AGRICULTURE.

Agriculture means the culture of the people who live on the soil, as well as the cultivation of the soil itself. Our chief difficulty lies in the fact that Indian agriculture is in the hands of small men, the capital is required in small sums, and it is supplied by small capitalists to men of small commercial intelligence at anything but a small rate of interest. During my tours in the United Provinces, Bengal, Eastern Bengal and Assam, Central Provinces and the Bombay Presidency I was much struck by the lack of real practical knowledge amongst the ryots who are conservative to a fault. Many conclusions arrived at Agricultural Colleges in this country are never heard of even by the better class cultivators. We perhaps are to be blamed slightly in this matter. There is only one way of improving the ryot's welfare and that is the eternal truth of getting into their skins, of realising their ideas and feelings. When once we see their point of view we shall guide them with greater ease to adopting improved methods of agriculture. Then will they take to improving their jute crops, *e. g.*, in cultivating a whiter fibre, in growing jute in rotation with paddy—a very profitable and economical enterprise—in planting and transplanting paddy more carefully and cheaply and in cultivating new staples. The soy bean, for ex-

ample, has undoubtedly enormous interest for India and a struggle between bean oil and cotton oil in the soap countries in the world has already begun. If its introduction into this country is successful there should be little difficulty in competing with Manchuria. Dry Farming which has been so successful in America might be introduced in a larger degree. Dry Farming means roughly the cultivation of drought resisting plants and also the most advantageous use of rainfall on the soil by careful preparation. A great deal can be done in the way of co-operation whether in the form of credit societies or of supply societies, *e. g.*, for providing the materials of agriculture, productive societies, *e. g.*, co-operative dairies and sale societies such as lac or grain societies. When in Eastern Bengal and Assam I found some startling rates of interest. Three villagers borrowed a maund of rice when the market price was Rs. 6 per maund. Not being able to pay in cash they made a bond for Rs. 7 stipulating for interest at 150 per cent. compounded every three months. In less than three years they were sued for Rs. 200 and the Munsiff decreed the entire claim. In another case three villagers executed a bond for Rs. 9 for cloth purchased stipulating for interest at 187½ per cent. every quarter. The same Munsiff gave a decree for the principal with simple interest at 75 per cent. I know of another case where 2 men took a loan of Rs. 15 at Rs 1 interest a day which comes to 2,433½ per cent. yearly. At the end of three years an *ex parte* decree for a claim of Rs 999 was given. There is scope for a more extensive use of agricultural machinery, but sufficient attention will have to be paid to the peculiarities of local agricultural methods. The work of Mr. W. H. Moreland, Director of Agriculture, United Provinces, has been very successful in this respect. Co-operative rural societies may own jointly agricultural implements and will decrease the limitations imposed by the

scarcity of capital in agriculture. Bengali ryot like his frater in the Deccan is supremely critical of any machine containing unnecessary parts or whose utility is not obvious. Superficial finish of machines, *e.g.*, highly varnished and coloured metal surfaces so attractive to the European is not desired by the Indian cultivator. There are local peculiarities, *e.g.*, the ryot of Eastern Bengal and Assam does only about $\frac{1}{3}$ or $\frac{2}{3}$ of the work of an efficient English labourer, his pair of bullocks can do but $\frac{1}{2}$ the work of an English pair of horses. His oxen are trained to go counter clockwise and gears must be designed accordingly. The flexor muscles are better developed than the extensors, so the ryots work more effectively with a drawing than with a thrusting stroke. Lastly he would rather sit down to turn a horizontal wheel, than stand up and turn a vertical wheel for a much shorter period.

WEAVING.

Of industries closely allied to agriculture weaving is the most important. 80 per cent. of the weavers in Eastern Bengal and Assam are engaged in agricultural pursuits. Dacca has always been famous for its muslins—Abrawan or "running water," Bafthwa or "woven air," Shshnam or "evening dew," though these are almost a thing of the past; and the demand in Europe for the old cotton flowered and sprigged muslin has almost entirely fallen off; when Burke prepared his impeachment of Warren Hastings the output of muslins and silks of Dacca was declared to have an annual value of Rs. 52,50,000. Though this sum is probably exaggerated yet in Europe there was an exceptionally huge demand for these celebrated goods. To day European taste has entirely changed and chiffon and similar substitutes have taken the place of Dacca muslins. Another reason for the decline is that there is an increasing sale of Japanese silks. A few years ago, I got three grades of chiffons from London and the prices were roughly—12/-, 1/- and 1/7-/. Prices of

similar grades of Dacca muslins are about 13 or 14 annas and one rupee thirteen annas to 3 rupees, ten annas a yard. The chiffon indeed looks even better than the local muslins. The salvation of weavers does not lie in the adoption of large and often expensive looms. It will be more expedient, firstly to utilise existing looms to better advantage by slight alterations which will increase the yield in many cases to 30 per cent., and secondly to assist the weavers to buy yarn cheap and to sell their products dear. There is no use at present for a central weaving school in Dacca until we have first looked to these points. In Eastern Bengal and Assam quite 75 per cent. of the weavers are dependent on Mahajans. In many provinces that I have visited, a weaver gets very little more than the cost price in good seasons and very much less than this price in bad years. What is wanted is an organisation to enable the weavers to dispose of their wares as economically as possible. There is no need at present for large expenditure on bricks, mortar, and laboratory appliances. Our industrial development is not, as many are apt to think, a matter that can be hurried and hurried.

SUGAR

The most striking fact of Indian Commerce in recent years has been the tremendous and unparalleled expansion in our sugar imports. This is especially phenomenal when we remember that India is probably the largest producer of sugar in the world and sugar is indispensable for a warm country like that we live in. It, however, cannot be said that the cultivation of sugarcane in India is contracting seriously because of these imports. We have to remember that the sugarcane in India is often grown in small patches which defy estimate and moreover the great mass of the sugarcane of this country is not converted into crystalline sugar but is consumed in the form of crude sugar or gur which is more nutritious than refined sugar. It is at the same time impossible not to believe that this huge

importation of foreign sugar at the rate of 107 lacs of cwts. yearly or nearly 2 seers per head of population can be continued without affecting the internal industry as a whole. You ask then what is to be done? We are not taking pains enough in the struggle for markets. We ought to develop the central factory system, i.e., factory situated in the centre of a tract of land reserved for sugar and its rotation of crops only. The cane is then as near the mill as possible and cultivation, cutting etc., can be done with the least possible waste. The complete triumph of this system is seen in the regeneration of the sugar industry in Formosa by the Japanese, and in Porto Rico. The Java planters according to the British Consul in the island, are devoting a large portion of their profits to improving their methods of production, while steps are being taken to provide better transport and machinery of the latest type. The price of imported sugar will fall probably as a result of this and Indian sugar will be subject to serious competition in its own markets. A protective tariff, I do not think, will cure this lack of enterprise. The ryots are strongly averse to using effective crushing mills. The most suitable mills are the three roller mills and these might be purchased by some of our rural co-operative societies. At the Allahabad Exhibition, the Hindi plant proved its excellence and sugar making by this process among better class cultivators would be profitable. In some provinces, there is great need for the Central Factory system. In Eastern Bengal and Assam, the East India Company had extensive mills and even to this day, there still remain some large sugar factories. In Rangpur especially as the district has a belt of country on both banks of the Jamuneswari suited for cane cultivation there are special advantages for a central factory.

I cannot go into details in the present paper with regard to the production of goods of a complex character on a large scale by up-to-date

methods. It is necessary, nevertheless, to refer to the importance of choosing a good locality in which raw material and fuel can be obtained cheaply, and from which goods produced can be readily transported to the consuming markets. There is need also of obtaining well-paid skilful artisans as the results of the experiments of employing captains of industry on this basis has been exceptionally successful in Japan. We must not forget that Indian industry is limited by capital. Without capital, land cannot be cultivated, mines cannot be worked, nor can factories be constructed. We are apt to think that laws and governments can create industry. This is seen in the argument for protection to native industry as the sole panacea. Government is playing a noble and generous part in increasing the efficiency of labour by education and sanitary legislation and it is thus enabling capital to do more work. When all is said and done it still remains true that one of the real limits to industry is capital.

CAPITAL.

The investment of British Capital in India has been discussed at length in two interesting papers read by Mr. George Paish before the Royal Statistical Society in 1909 and in 1910 respectively. Mr. Paish remarks: "No one can doubt the beneficent effect upon the prosperity of India of this expenditure of British capital for the development of the natural resources of the country, and the linking up of district with district, which has so powerfully helped to diminish the severity of famines. The great sums shown below have been lent to India at an exceptionally low rate of interest, and having regard to the immense increase in the wealth of the Indian people which has resulted, and is resulting, from the construction of railways, the burden of the low interest charge is quite negligible." The details are as follows:—

	£ (000s omitted)
Government	178,995
Municipal	3,522
Railways	136,519
Banks	3,400
Commercial and Industrial etc.	2,647
Electric lighting and power ..	1,763
Financial, land and investment	1,853
Gas and water	659
Iron, coal and steel	803
Mines	3,531
Motor traction and manufacturing	90
Oil	3,184
Rubber	4,610
Tea and coffee	19,644
Telegraphs and telephones ..	43
Tramways	4,136
Total	365,399

It is interesting to note that Australasia has borrowed 380 millions, Canada and Newfoundland 373 millions and South Africa 351 millions, the United States 688 millions and Argentine 270 millions, followed by Brazil, Mexico and Japan with 24, 87, and 54 millions respectively. Mr. R. N. Mukerjee, C.I.E., an eminent Indian business man, in the course of his Presidential Address at the Indian Industrial Conference in 1910, said in words which must be repeated: "Indian capital is proverbially shy and unenterprising, but this I ascribe largely to a want of industrial and commercial knowledge on the part of Indian capitalists, and consequent failure to realise the potentialities of the various schemes placed before them, coupled with a disinclination to depart from those time-honoured methods of investing and lending money, which have been in force for so many centuries and in many instances, bring in a return which can only be considered as usury. India, generally speaking, is a poor country, that is to say, the majority of the population are poor. But

there is wealth in India, and the possessors of it could, with but a fractional part of their amassed wealth, not only develop many of the industries that are dormant to-day, but make India industrially equal to any other country in the world. We often see articles in Indian newspapers, or hear speeches from public platforms, condemning the use of foreign (English) capital for the development of Indian industries. But, I am afraid, those who hold such views do not seriously consider the question in all its aspects. Apart from the fact that foreign capital is only attracted by signs of peace and prosperity, and that we know that foreign capital is welcome in any other country for the development of her industries, an important consideration for us in India arises from the fact that, for our own good, it is wise to allow British capitalists to interest themselves in our industries, and thus take an active part in their development. That industrial enterprise can be successful in India is amply proved by the many large and thriving industries, representing millions of capital which already exist, and it is a reproach to us, as a people, that practically the whole of these, with the exception of a certain number on the Bombay side, have been financed and developed by English capital and energy. It is true that when these industries were first started, our countrymen had little interest in, or knowledge of, such enterprises, but that attitude is rapidly changing, and it should be our aim and endeavour to emulate the example set us by our English fellow subjects and to join with them in the industrial development of India." It is the fashion in some quarters to protest against the incoming of British capital. India could well do with more of it. Canada and the Argentine Republic are having their railroads constructed for them and are increasing their trade in a way they could never do without this capital. The bulk of the Canadian and Argentine shares have gone into railroad construction. India is credited with

is no doubt that the export of cotton seed would decrease but there is every likelihood of a ready sale for the manufactured article in the form of articles of food and the edible oil might also form a suitable substitute for ghee of which the supply is now falling short of demand. Then again there is the case of paper. The raw materials for paper making are available in the country though not in an exactly accessible form. Large supplies of wood-pulp and wood meal could be made available from the forests of spruce and silver fir in the mountains and fibrous grass from the forests at the foot of the Himalayas. Vast quantities of hides and skins are exported which ought to be manufactured into leather and enormous consignments of cotton cloth which might be made within India itself if the staple of her cotton was systematically improved. It is surprising to find that in the classical days of Greece and Rome three products of India attracted the notice of curious enquirers—a tree from which the Indians made cloth (the cotton plant)—a reed from which a sweet juice was expressed (sugar-cane) and a plant yielding a dark blue dye known as indicon (indigo). These are the very industries which are in jeopardy to-day. These plants were not known to the ancient agriculture of Egypt and Mesopotamia. India has found herself surpassed by America and Egypt in growing crops that were peculiarly her own. In Egypt the cotton plant produces fourfold, in the West Indies the sugar-cane produces nearly threefold the return that they yield in India. And the cultivation of indigo now appears to be doomed by the manufacture of artificial dye in German laboratories. The Indian industrial progress has certainly been great during the last three decades but during the next two decades remarkable development will take place. We have to remember that the foundations of India's industrial prosperity have already been laid, her productive power is capable of infinite expansion, and the time is now at hand to improve

Indian Agriculture by strictly practical means so that its products can compete in the markets of the world, to extend her railways and irrigation, to coax British capital and above all to foster a strong spirit of co-operation. We must do away with hasty sentiment; we must go forward with a high heart and sober self-reliance. Let us hasten with caution, for, as some one has said, the most tragic miscarriages in history have been due to the impatient idealist and surely he is not absent from our midst.

SWAMI RAMA TIRATH.

AN APPRECIATION.

BY MR. PURAN CHAND.

FROM the heart of the people of this country once did rise prayers breathing peace for the whole universe. It was when they were tired of war and conquest, it was when the warrior race came home and saw that they had sold their soul for a mess of pottage—earthly empire. When the Aryan mind found that the battles won were really the battles lost, it turned inward. The spirit of renunciation completely vanquished the spirit of conquest in them. Peace and Love spread over the land and made it the holy land of the neighbouring races. From that time on, that page of Indian history has been considered blank where the life of renunciation is absent. In India, the ideal is not to measure success by the amount of gold one can manage to accumulate, nor even by the amount of knowledge one toils to store, nor by rank, nor by position, but only by the amount of self knowledge and self-culture. Man is to be judged not by his outer circumstances but by his inner experience. It is the inner man only that is held worshipful. The silent inner life of the sage though by no means eventful to outward seeming, reflected as it is from moment to moment

in a smiling profile, kind look, generous heart and tranquil mind is, in fact, the only true life whose evolution mankind ought to study. The story of such a life would consist in recounting the inner experiences of the saint in the form of his thoughts and teachings and still more in depicting the saint himself with his mystery-opening smiles and glances. Swami Rama's biography is that of the inner man. It is but the silent evolution of his mind, emerging from the world of matter by slow processes of self-realisation and entering into the domain of spirit.

Swami Rama's life is a rural hymn set in the tunes of the prairie and the jungle, singing of universal peace and love. It is the same note that had its birth in the glorious *Upanishads*. Nothing new about it but the singing of it, Swami Rama raised it once again from the bottom of his soul and he poured it forth in savage cries calling man from discord to harmony, from difference to agreement in-difference, from self to self-in-all, from diversity to unity-in-diversity. He called man away from hatred to love, from war to peace. From him did flow goodwill to all and charity of thought and feeling. He was a poet of the inner man and the inner nature. To him all men and things were divine. "*Tattvamasi*"—"Thou art That," "*Ekamaivadvityam*"—"One without a Second," these two *mantras* may be said to be the two golden wings balanced on which this ethereal *Hansa* soared every hour of his life into the eternal blue and soaring ever soared further and further till he was lost in Infinity.

Swami Rama was born in 1873 at Muraliwala, a small village in the District of Gujranwala, Punjab. He was born in a poor Brahman family. It is said Goswami Brahmans of Muraliwala are the direct descendants of Goswami Tulasi Dass, the famous author of the Hindi Ramayana. His father Goswami Hirananda had no means of livelihood except what the spiritual tours undertaken by him to Peshawar and Swat brought him. He was

the family Guru of the Hindus of the North-Western Frontier Province. Goswami Hirananda had to go to his disciples on ministering tours from time to time. Swami Rama's mother died a few days after his birth. He was brought up on cow's milk. It may be remarked here that though a Punjatee, Swami Rama's staple diet was milk and rice. He was very fond of milk and he could drink about 5 seers of it at a time. Swami Rama was thus born under the lowly roof of a poor Brahman family. He became a student at the age of five. His childhood and boyhood were passed in hard study. As he reached the higher classes, his father was not able to support him, and as a student he lived in extreme poverty. The dress of the boy Rama consisted of a shirt, a pair of Punjabee trousers and a small turban, each made of a cheap and very coarse country cloth, the entire outfit costing about Rs. 3. His fellow students relate that at times, he would forego his meals for the oil of his mid night lamp in his College days. Many a time he had to starve for days together without, however, showing the least signs of suffering or sorrow on his face, for he attended College regularly with a calm and peaceful appearance and kept to his studies as usual.

He had a soft handsome face of a typical Aryan cut. The eye-brows arched over deep black eyes, which showed the mystery and love of his soul. In contrast with a big, broad, prominent forehead, showing high intellectual power there was feminine softness round his lips. When he was serious, the lower lip pressed against the upper on a small round chin, which betokened indomitable strength of will. As a College boy, he seemed to give no promise of his remarkable after-career, but whosoever saw him even then, was impressed with his angelic nature and with a purity and innocence of life rarely met with. He was bashful like a modest girl. Living as he did in the light of love, he looked transparently pure through his small, frail, fair

SWAMI RAMA TIRATH

Swami Rama's personality may be described as explosive. He would remain silent for months together as if he had nothing to say. He remained merged in joy. All of a sudden, he will burst out like a volcano and give out his thoughts in a wild manner. Whenever he spoke or wrote, one could be sure of getting something very refreshing and original. It seems he could not remain long in society without feeling some kind of loss which entailed weariness of soul to him. He used to run back to the mountainous solitudes to recover himself. There he would keep peace with running waters, with glorious sky and would lie on rocks for hours together with his eyes closed and his body thrown in the sunlight.

Swami Rama's highly cultivated emotion formed another attractive feature of his personality. Deep sincerity rained down from his eyes in such an abundance. His sweetness was irresistible. Mahomedans and Hindus loved him alike. The people of different races could see and recognise in this man Swami Rama some family likeness with themselves. Americans called him an American, Japanese called him a Japanese, Persians saw a Persian in him.

To see Swami Rama was to feel inspired with new ideals, new powers, new visions and new emotions.

Another feature which contributed to the charm of his very presence was his bold independence of thought, his great towering intellect. Whatever he taught, he had not only thought upon, but he had actually seen its working in his own life. He used to say that he believed in *experiential religion*. According to him the art of living consists in *luminous belief*. Theology has very little to do with the inner religion of the living man. If you are a living man, test the truth by trusting your life to it. Just as in science, authority has little weight in arriving at truth, so in religion, authority should have little or no weight and religious truth bearing on the nature

of inner man must be everybody's own and personal property through self-realisation. Every one must go to God through the failures and successes of his own life. *Life itself is the greatest revelation.*

Swami Rama after spending two years in the Himalayas, came down to the plains burning with missionary zeal for scattering the joy that he had found in himself. He sailed for Japan from Calcutta in the year 1903. He was only for about a fortnight in Japan. He was invited twice to speak to Japanese audiences. A Christian paper of Tokyo spoke in high terms about his personality and announced him as the "enthusiastic apostle of Vedanta."

On meeting Swami Rama for the first time, Dr. Takakuthau, Professor of Sanskrit and Eastern Philosophy in the Tokyo Imperial University, said to the writer that though he had many an opportunity to see Indian Sadhus and Pandits at Professor Max Muller's in England and also at other places in Germany, yet he had seen no man like Swami Rama. He was the perfect embodiment of Vedanta Philosophy. Mr. Kinzo Hirai, the famous Professor of Tokyo, who was the eloquent representative of Buddhism in the Chicago Parliament of Religions, was reminded of the Buddhistic period of Indian history of which he had read such vivid descriptions in Japanese and Chinese scriptures, when he conversed with Swami Rama. Mr. Hirai always remembered him after he had gone away to America as the "truly inspired Rama."

Swami Rama left Japan in November 1903 for San Francisco. He was for about two years in America. Most of this time, he lived in solitude. There he lived a simple life, carrying his own fuel on his head from the forest. People of California were struck with the indifference with which he treated the eulogies on his work and life and threw hundreds of newspaper cuttings into the Sacramento river for its information. He made a

we are ready to sanction considerable increase in expenditure.' The Education Commission of 1882 regarded this dispatch as definitely accepting 'as a State duty the education of the whole people in India.' One of the recommendations of that Commission was as follows: 'An attempt should be made to secure the fullest possible provision for an expansion of primary education by legislation suited to the circumstances of each province.' In the now famous resolution on Indian educational policy of 1904, the Government of Lord Curzon stated: 'There are more than eighteen millions of boys who ought now to be at school, but of this only a little more than one-sixth are actually receiving primary education.' Again, 'these figures exhibit the vast dimension of the problem and show how much remains to be done before the proportion of the population receiving elementary instruction can approach the standard recognised as indispensable in more advanced countries.' Further on, they said: 'They consider that primary education possesses a strong claim upon the sympathy both of the Supreme Government and of the local Governments and should be made a leading charge upon the provincial revenues.' The standard and methods of Western countries were definitely accepted as the guiding principles of Indian educational policy. In the circular letter of the Government of India, dated 22nd November, 1906, they expressed a desire to abolish fees as soon as the finances of the country permitted, and added the hope that the time had arrived for such a step. They said: 'To insist upon the permanent retention of fees is manifestly incompatible not only with universal school attendance but with anything that approaches to it.' The Government of Madras accepted these declarations of policy and were prepared to introduce the scheme of free primary education *per saltum* instead of gradually—*vide* letter dated 21st February, 1908. Though universal free primary education has not been stated in terms as a definite policy of the Government of India, there can be no doubt that that goal has been steadily kept in view in the expansion of primary education.

4. I think that the present method of promoting primary education must be pronounced to be substantially a failure. The number of boys at school in the primary stage at various quinquennial periods is stated as follows in Mr. Orange's report:—

1881	2,061,000
1887	2,381,000

1893	2,680,000
1897	3,028,000
1902	3,009,000
1907	3,631,000

Mr. Gokhale states in his speech that three million nine hundred thousand may be taken as the number of boys at school in the primary stage in 1911. The apparent ratio of progress has, however, got to be reduced with reference to the growth in the population of British India during the thirty years ranging between 1881 and 1911. The entire male population of the Indian Empire, with reference to the census of 1881, 1891, 1901 and 1911 is as follows:—

1881	101,321,656
1891	112,542,739
1901	117,801,912
1911	124,791,881

While the increase in the number of boys at school during the period from 1881 to 1911 may be taken roughly as 75 per cent., 25 per cent. out of it must be deducted as merely due to the increase in the population of the country. The ratio of boys at school to the total population of school-going age has no doubt been raised, but the increase in the number of boys for the thirty years may be roughly stated at about one million. If the population of India continue to be stationary and do not multiply at the rate at which it has done during the last thirty years, and if we take the present male population of school-going age at eighteen and odd millions on the basis of a 15 per cent. calculation, it must take nearly 250 years for the entire population of school-going age to be at school at the rate of $1\frac{1}{2}$ million for every thirty years. But as population increases in a geometrical ratio at the rate of 25 per cent., which is the increase during the last thirty years in the total population of the country, the problem of universal mass education on present lines must be hopeless indeed. If population and the number of boys at school both rose in geometrical progression at their present rates it would take at least 120 years for the whole population of school-going age to be at school. I have adopted the 15 per cent. ratio even for the four years of school attendance which Mr. Gokhale has fixed in his Bill, as Mr. Hardy's calculation of 15 per cent. for ages ranging from 6 to 11 was apparently for European countries and the shorter longevity in India would probably justify the same rate for ages ranging from 6 to 10. In the review of Mr. Cotton's report of 1897, the Government of India regarded the position as by no means encouraging, and they

characterised the progress as slow indeed. Nathan's report of 1902 for the quinquennium between 1897 to 1902 showed a set back, and he characterised the general rate of progress as 'most unsatisfactory.' Then followed the Educational Resolution of 1904 and more vigorous activity. On this Mr. Orange remarks at page 98: 'The rate of increase whether for the last twenty five years or for the last five is very slow when compared with the distance that has to be travelled before primary education can be universally diffused. If the number of boys at school continued to increase even at the rate of increase that has taken place in the last five years (that is, six hundred thousand to three millions) and there were no increase in population, several generations would still elapse before all the boys of school-going age were in school.' The voluntary method of persuasion must be condemned as a hopeless failure.

* 5 A policy of increased grants on definite lines is accepted by my honourable colleagues. An annual increment of 2 lakhs out of provincial revenues added to the present contribution of 923 lakhs, as suggested in paragraph 25 of the letter, will have to be continued for 40 years before the estimated provincial subsidy of 88.35 lakhs necessary to cover the present boy population of school going age taken at 2,039,000 is reached. But that population ought really to be taken at 3,057,000, for, Mr. Hardy's 15 per cent was for European countries and for ages between 6 and 11, and for shorter longevity in India may be assumed for ages between 6 and 10. If this be correct the period must be extended to 60 years. This again will have to be raised to 90 years if the cost of education is raised by 50 per cent. (see paragraph 9 of the letter) for the extended course of six years. Meanwhile, it is fair to assume that population will have doubled itself, leaving the problem of universal education as far from solution as ever. Unless therefore a substantial incremental addition from Imperial funds is certain there is practically no chance of realising the anticipation made in paragraph 25, namely, that the universal education of boys might be brought within reach in less than a generation. There is no doubt that, if more money were spent on primary education, better results would follow. But no resolution for increased subsidy on the part of the Executive Government can be free from the modifications consequent on the change of personnel or the fluctuations of finance, or the exigencies of

foreign or domestic policy. Nor has a resolution of Government the virtue of accelerating progress to the same extent as the legislative acceptance of an ideal placed before every town and village as the motive of local organisation and effort.

6. The only alternative which has been accepted in modern times and been found invariably successful wherever it has been tried is the policy of compulsion. The rigour of that policy Mr. Gokhale has endeavoured to soften by the adoption of what may be called 'optional compulsion.' But various objections have been taken to it, sometimes even from opposite standpoints:—

(a) It is argued that the measure is fraught with 'grave political danger,' as compulsion is certain to breed 'discontent to a dangerous degree.' In paragraph 6, however, it is admitted that it 'may fairly claim to rank as a popular measure.' Before I proceed to examine this it is interesting to notice that in 1868, Lord Lawrence observed: Amongst all sources of difficulty in our administration and of possible danger to the stability of our Government, there are few so serious as the ignorance of the people.' Education amongst Hindus of the higher castes has been regarded as a religious sacrament, and the reading of the Koran as a solemn religious duty amongst Mussulmans. It is admitted that 'in India it is not the case, as in Japan in 1872, that farmers, artisans and merchants regard learning as beyond their sphere' (see paragraph 7). That any gentle pressure for the diffusion of education will ever be regarded by the people of this country as the tyrannical exercise of authority is, to my mind, extremely problematic. The enormous body of opinion, larger in volume than has found expression on any other question within my knowledge, has been discredited as in no sense representative. But it is a truism in politics that the voice and vote of every man, even if he be articulate, are unnecessary to signify the general acceptance of a view and that the judgment of the thoughtful section, selected at random from the common body, is a sufficient index to the popular feeling. Mr. Gokhale has rightly cast the initiative in the matter of compulsion upon local bodies. The sanction of the local Government is a safeguard against hasty action. The facilities for exemption from payment of fees and even from attendance on the ground of poverty or inconvenient avocations, must minimise the chance of friction between individual disinclination and compulsion from superior authority. The Government of India have rightly pointed out in their resolution of

1904: 'To the people themselves, the lack of education is now a more serious disadvantage than it was in more primitive days. By the extension of railways, the economic side of agriculture in India has been greatly developed and the cultivator has been brought into contact with the commercial world and has been involved in transactions in which an illiterate man is at a great disadvantage. The material benefits attaching to education have, at the same time, increased with the development of schemes for introducing improved agricultural methods, for opening agricultural banks, for strengthening the local position of the cultivator, and for generally improving the conditions of rural life. Such schemes depend largely for their success upon the influence of education permeating the masses and rendering them accessible to ideas other than those sanctioned by tradition.' The popular appreciation of the present-day need for an acquaintance with the three R's is sufficiently keen to save the masses from a sense of political oppression as the reason for compulsory attendance, even with an educational rate adding 40 lakhs to their present burdens in this Presidency.

(b) It has, on the other hand, been argued that a law for compulsory school attendance is bound to remain a dead letter.

(i) It is maintained that school-attendance committees will exempt almost everybody for one reason or another from the obligation to attend school. I see no warrant for this assumption. *The committees themselves are required to be constituted under by-laws which must have the sanction of the local Government. It is easy to provide for an officer of the Educational Department of the rank of supervisor or sub-assistant inspector (there are 268 supervisors and 111 sub-assistant inspectors in this Presidency according to the report of 1907) being a member of each school-attendance committee so as to prevent any laxity of action on the part of those committees. We may even adopt the analogy of section 3, clause 1, of the Irish Act whereby provision is made for half the members being appointed by the local authority and the other half by the Commissioners, whose place may be taken here by the inspector of schools, or the Director of Public Instruction.*

(ii) An objection has been raised of the want of competent or qualified teachers. This has always been the standing argument against compulsory education. The qualification of the teacher is nothing more than a knowledge of

reading, writing and arithmetic. This minimum can be found amongst many people who have never obtained the normal training school certificate. It is found necessary to employ at the present day in England large numbers of uncertificated and student teachers—please see the report of the Board of Education for 1908-1909, pages 116 and 117. When Japan inaugurated compulsory education, Sharp says: 'There was a natural difficulty about teachers. The Japanese had little conception of a trained teacher. Any one who could speak a language was supposed to be capable of teaching it' (paragraph 23). 'Even at the present day,' he says in paragraph 452, 'though primary teachers ought, by rule, to be provided with licenses, owing to the shortage in teachers, there are many who are not (21.5 per cent.) and some are preparing themselves for the licensing examination.' Though licensed and properly qualified teachers are the ideal to be aimed at I cannot agree that the lack of certificated teachers is a serious impediment to Mr. Gokhale's scheme.

(iii) Another objection is based on the ground of lack of school accommodation. Clause 7 of the Bill insists upon its provision. Mr. Gokhale said in his speech at Madras: 'If Japan may be content with verandahs for school-houses, there is no loss of dignity for the Indian school boy to be housed in such a manner.' The idea of substantial school buildings according to type-designs is borrowed from Western conditions of climate not applicable to this country, and this poor country may well dispense with such structures. It has been my conviction that more money has been wasted on the fattening of contractors and the Department of Public Works than is justifiable in the climatic conditions of this country. A thatched or tiled shed situated in the midst of half an acre of open ground dotted with a few trees, the whole thing costing only a few hundred rupees, is far more adapted for the needs of a school house in this country than the more costly structures which may gratify the eye of the cultured architect.

(iv) A more serious objection than all that has gone before is the shortness of the course provided by Mr. Gokhale's Bill. It is said: 'It is true that Japan and Baroda began with four years, but they are finding that the period is too short. Unless we can go in for six years, the game is not worth the candle.' But this argument overlooks that both Japan and Baroda have achieved solid results on a four-year basis. If they are now

dissatisfied after years of trial with the old period, that is no reason why we should not begin on a modest scale leaving it to the future to extend the period when changed conditions may justify such a course. It was in the year 1908, after thirty years' experience of a four-year elementary course, that Japan thought it was time owing to its deficiencies to extend the elementary school course to six years. I am unable to accept the statement that a boy who has gone through a four-year course forgets everything that he has learnt in after life even amidst the opportunities of agriculture or other business bringing him into contact with writing and correspondence. I quite admit that some men who have only received this modicum of education between 6 and 10 may, in after-life, forget their early acquisition. But it is a great exaggeration to assert that every man amongst those who only received a four year training has an absolutely blank mind with reference to what he learnt in his early days. Reading, writing and arithmetic meet a man at every turn in his life whatever be his avocation. If he had a foundation in those directions in early life, the ordinary relations of life must tend to increase his knowledge without any further schooling. The value of that knowledge, small as it may be, in enabling the agriculturist, the day-labourer, and the petty trader to carry on his avocations with more intelligence and less liability to deception cannot be over rated. He is more accessible to a knowledge of the rules of hygiene and sanitation spread through leaflets and newspaper paragraphs, and he must be regarded as altogether a happier man for the greater ability to accommodate himself to the forces of nature and the surroundings of modern life. Moreover, it is not unreasonable to hope that in many cases a compulsory four-year course may lead to a voluntary addition of two years. I am unable to agree with paragraph 14.

The period selected by Mr. Gokhale very little affects the boy-labourer of a factory who can only enter it after he is nine (vide section 23 of the Factory Act), and the ordinary needs of agriculture cannot be said to be dependent upon the labour of boys who are below ten years of age. I do not, therefore, share the view expressed in paragraph 16.

(v) That compulsion is impracticable or will be largely resisted by the people is effectively refuted by the example of Ceylon and Baroda, not to speak of the Philippines, for the conditions of the Native State and the neighbouring island of Ceylon

are in every respect similar to those of British India. It is true that their area is much smaller. But although that may have a bearing on the financial aspect of the question, it has none with reference to the disposition of the people to accept compulsion.

(vi) The strongest and, perhaps, in my judgment, the only argument against the Bill is the financial one. Mr Gokhale has endeavoured to reduce the expenditure in various ways. He proposes that the Act shall not be applied to any area in which one-third of the school-going population is not already under instruction. He reserves the discretion to the municipality or local board to apply it to a particular local area. He burdens the locality with the financial responsibility for one-third or more of the cost so as to check the too ready disposition to avail itself of the new law. He gives the local Government a further discretion to accept or not the proposition of the municipality or local board to apply the law to the locality. These appear to my mind to be very substantial limitations upon the scope of proposed legislation. But figures worked out on the basis of an immediate application of the provisions of the Act to every local area are misleading. I would be prepared, if necessary, to add a limitation to the provincial contribution in amount instead of merely in ratio. Section 18 of the Irish Education Act of 1892 provided a fixed grant 'of 210,000 pounds or of such other amount as Parliament may determine having regard to the amount of free grant under the Elementary Education Act, 1891.' The distribution of this amount was determined by the fourth schedule to the Act. My present suggestion would, to a certain extent, assimilate my scheme to the scheme of increased grants without legislation accepted by my honourable colleagues. But my idea is to fix a statutory maximum, which may or may not be worked up to as the result of local bodies applying the Act to their special areas. Or under section 18, by-laws may be framed fixing the maximum provincial contribution from time to time to be divided amongst local areas whose application of the Act and levy of the educational rate are approved by the local Government. I have thought it unnecessary in view of the above suggestion to examine the financial aspect in detail for determining the possible scope of Imperial or provincial expenditure under the Act.

7. I agree with Mr. Gokhale in claiming for compulsion greater results in the spread of education than for any other known means of action.

Quoting from the report of the Royal Commission of 1886, he says : 'The increase of the numbers on the roll is largely attributable to compulsion. Among the witnesses before us, Mr. Stewart appears to stand alone in his opinion that provided that required accommodation had been furnished, the results would have been much the same if attendance had not been obligatory. But to estimate fairly the influence which compulsion has had upon the great increase in the number of children attending school, we must speak of it under the three heads into which its operations may be divided. There is first the *direct influence of compulsion*. This is exerted over parents who are indifferent to the moral and intellectual welfare of their children who are very eager to enjoy what advantage they can from their children's earning but who never look beyond. Secondly, compulsion exercises an *indirect influence*. Many parents are apathetic, yielding weakly to their children's wish not to go to school ; but they are keenly alive to the disgrace of being brought before a magistrate, a fear of which supplies a stimulus sufficient to make them do their duty in this respect. In addition, the existence of a compulsory law has considerably affected public opinion and has done much to secure a larger school attendance by making people recognise that the State regards them as neglecting their duty if their children remain uneducated.' The Ceylon Commission of 1905 expressed itself as follows :—

'With the exception of one or two districts of the island, little good will be done by any system which does not enforce compulsory attendance. The parents throughout a large portion of the island exercise very little control over their children and will leave them to do as they like in the matter of school attendance. The result is that, where there is no compulsion, boys attend very irregularly and leave school very early. That compulsory attendance is desirable, we have no doubt.'

8. I have so far dealt with the objections to compulsion even under the limitations contained in Mr. Gokhale's Bill. But there are certain objections of detail most of which, I venture to believe, might have been taken to the Irish Act and the Ceylon Ordinance :—

(a) With reference to paragraph 13 of the letter I think the precaution suggested is exaggerated. It is enough to say that not less than half the numbers shall be present at the meeting, voting for the introduction of compulsory education and the imposition of a special cess and that the majority shall be not less than two-thirds of those present.

(b) I do not agree with paragraph 17 of the letter. In teaching the three R's no school appliances are worth mentioning. The teacher is implied in education and funds are provided for with a view to supply him.

(c) Objection is taken in paragraph 15 to the one-mile limit of road between the school-house and the pupil's residence. This provision is modelled on clause (a), of section 3 of the Irish Act, which prescribes a two-mile distance 'by the nearest road.' The word 'road' has created no difficulty in Ireland for the last twenty years and need not in British India.

(d) Objection is taken in the same paragraph 15 to 'other sufficient cause' in section 5, clause (b), and apparently also to the phrase 'seasonable needs of agriculture.' These words are substantially reproduced from clause (b), section 3, of the Irish Act. If they confer an undesirable latitude of discretion on the attendance committee, the power to make by-laws is sufficiently wide under section 18, and can, if necessary, be made wider to circumscribe the action of the committee.

(e) It has been said that the limit of income, which is a ground of exemption from payment of fees, will lead to inquisitorial enquiries and is an unworkable criterion in practice. I am disposed to agree with this criticism. I think it is sufficient to empower the committee to exempt individuals on the ground of poverty as in clause 2, section 9. The rules as to poverty must be different in different localities and may to some extent be defined by by-laws or left to the absolute determination of the committee.

(f) The constitution of the committee is left to by-laws under section 19. They may differ in different localities. But being subject to the sanction of the local Government, that authority, in my opinion, may insist on the presence of a supervisor or a sub-assistant inspector on each school committee or one half of the number being nominees of the Director of Public Instruction. This, in my judgment, will ensure considerable uniformity of action or at all events help to save the committees from very erratic courses of action. And if each head of a school, with reference to which the committee has to act, is also a member of the committee, I think we may feel pretty certain that particularly unreasonable conduct will be avoided in considerable measure.

(g) The Bill does not provide what shall be the character of the educational rate. The object of the author is apparently to leave it to the Government of India to determine its form. But

I see no objection, having regard to the importance of a taxing provision not being omitted from the statute itself, to an express provision that the educational rate shall be not more than six pies in the rupee of land-revenue to be added to the one anna of road cess, or a percentage addition to the house-tax in municipal areas. I am aware that a six pies additional road cess will bring in only about 28 to 30 lakhs from the local board areas in this Presidency. The addition to the house tax in municipalities will bring in only a few lakhs (about three lakhs on an extra rate of 2½ per cent with reference to the present receipt of 11 80 lakhs). If double this amount is provided out of provincial revenues, I would consider the income which would be capable of natural expansion sufficient for many years to come. My suggestion would entail no extra machinery or new methods of enquiry for the ascertainment and the collection of the tax. The present expenditure in Madras is 34 lakhs, of which provincial and local revenues together contribute 21 lakhs. The scale I have fixed is the maximum to be worked up to.

(A) I think it would be necessary to confer certain powers on local Governments with reference to the constitution of the school committees in place of the existing references to the Government of India. I agree with paragraph 24. But I do not think that any power to institute compulsion need be conferred upon the local Government.

(i) The provision prohibiting employment of a child that ought to be under instruction is a reproduction of section 2 of the Irish Act, and having regard to boys of nine and below not being eligible to be factory labourers, I see no objection to the enactment of clauses 14 and 15. I do not agree with the criticism in paragraph 16.

(j) The last three lines of clause 10, sub-clause 1, seem to me to be superfluous, clause 19 being sufficient for the purpose.

(k) Section 4 of the Irish Act speaks of attendance 'in such regular manner as is specified in the order'. Similar language may have to be employed in sub-clause (ii) of section 12 so as to prevent merely nominal compliance with the magistrate's order to, attend. No provision seems to me to be necessary to help parents of refractory children.

(l) I do not think there is any practical difficulty in determining what repeated non-compliance is within the meaning of section 13 as apprehended in paragraph 22. It may be advisable to enact a provision similar to sub-

clause (iii) of section 4 of the Irish Act, that a complaint with respect to continuing non-compliance with the attendance order shall not be repeated by the school attendance committee at any less interval than two months. But perhaps the object of clause 13 of the Bill is to limit the action of the school committee to a single complaint for repeated non-compliance.

(m) I see no reason to think that the penalties prescribed are too low as supposed in paragraphs 21 and 23. Imprisonment in default of payment of fine should be provided against.

9. The conclusion, therefore, to which I have come is that the Bill is desirable and necessary; that it is conceived in the best interest of education; that there is no reasonable probability of political or other danger arising from its enforcement; that it will largely accelerate the pace of educational progress; that allowing for laxity in the administration of the law here and there and for excessive zeal in its premature application to parts of the country, there will be an abundant return in the shape of increased interest in education amongst the great mass of the people and the educational authorities of the country. It seems to me that real political danger lies in resisting a large mass of enlightened opinion supported by European missionaries and by large numbers of Englishmen connected with the administration of the country so as to leave an abiding source of irritation and bitterness and a standing theme for a widespread public agitation which cannot make for the peace and good government of the country. I would support the Bill.

King George's Speeches on Indian Affairs.—Part I. A complete collection of all the speeches made by His Majesty during his tour in India as Prince of Wales.

Part II. Full text of all the Speeches delivered by His Majesty during the Coronation Durbar Tour. Price One Rupee. To Subscribers, Rs. 12.

The Depressed Classes.—A Symposium by His Highness the Gaekwar of Baroda, Mrs. Anne Besant, The Hon'ble Mr. Gokhale, Sir Valentine Chetol, Rt. Rev. The Lord Bishop of Madras; The Hon'ble Sir Narayan Chandavarkar, The Hon'ble Mr. V. Krishnasami Aiyar, The Anagarika Dharmapala and others. Price One Rupee. To Subscribers, Rs. 12.

All About Delhi.—With 36 illustrations. Rs. 1-8. To Subscribers, Rs. 1-4.

The Improvement of Indian Agriculture. by Mrs. Saint Nihal Singh. Rs. One. To Subscribers, Rs. 12.

G. A. Natesan & Co., 4, Sankaranga Chetty St., Madras.

THE MAHARAJAH OF DARBHANGA.

Council as Representative of the Non-Official Members of the Bengal Legislative Council to the place left vacant by his deceased brother, and since then, he has been elected four times to the Supreme Council as Representative of the Non-Official Members of the Bengal Legislative Council. He was awarded the Kaiser-i-Hind Gold Medal in 1900. He served as a member of the Police Commission in 1902, and, consequently, had to travel all over India. There were only two Indian Members in the Commission, the other Member being Dewan Bahadur Srinivasa Raghava Aiyengar, a Government servant. He appended two strong dissentient notes separately to the body of the Police Commission Report advocating some urgent popular reforms such as the separation of the Judicial from the Executive functions. He was created Knight Commander of the Most Eminent Order of the Indian Empire in 1902. The hereditary title of Maharaja Bahadur was conferred upon him in 1907. He has been elected four times as the President of the British Indian Association, the premier Landholders' Association of Bengal which has its head office at Calcutta. He is the Life-President of the Bharata Dharma Mahamandal, the Behar Landholders' Association, Tirhoot Landholders' Association, Maithila Mahasabha and the All-India Religious Association of Hindus. Under the Presidentship of His Highness, the Mahamandal has made considerable and rapid progress. It has secured a considerable amount of funds, owns a big house at Benares, publishes magazines in different languages, trains and employs preachers and does useful literary work. He is also a member of the India Famine Trust. He is the sole trustee of the Calcutta Mahakali Pathasala which is the first institution in Bengal to introduce the system of imparting education to girls on national lines combined with appropriate religious training, and it is being supported by a liberal subscription from Darbhanga Raj from its

very inception. He served most creditably as President of the Reception Committee on the occasion of the visit of Their Royal Highnesses, the Prince and Princess of Wales (now Their Majesties, the King Emperor and Queen-Empress) to Calcutta in 1906, and placed the sum of one lakh at their disposal to be used for charitable purposes to commemorate the event. The same was accepted and given by Their Royal Highnesses to the Medical College Hospital, Calcutta, and to the *Lady Dufferin Hospital Fund*.

When Khudiram committed the atrocious outrages at Muzaffarpore, the Maharaja Bahadur forthwith came to Muzaffarpore and strongly condemned the abominable deeds in the strongest terms, for which his life was threatened, but he did not care in the least and remained firm in actively uprooting anarchy and sedition. It was he who first conceived the idea of starting the Hindu Association with the triple object of fostering loyalty to the Government and King, protecting and promoting Hindu interests in a loyal spirit, and promoting friendly relations between Hindus and other communities. The Behar Hindu Association was duly launched into existence at Sonapore, of which he was elected President. Under the auspices of that Association, a grand public meeting of the Hindus of Behar was held at Muzaffarpore in 1907, under his presidentship, which condemned anarchy and sedition in a most forcible and effective way and established a permanent Loyal League, of which he was elected President. The object of the League is to take active steps to prevent the introduction of anarchical and seditious feelings into Behar. The Punjab Hindu Sabha was also established under his guidance and inspiration. He, in collaboration with Babu Sarada Charan Mitter, brought into existence the All-India Hindu Association. It was at his suggestion that His Highness the Aga Khan, consented to hold the Hindu Mahomedan Conference

at Allahabad in 1910, instead of at Bombay, as previously settled, and he took a very active part in that meeting.

He is founder and principal Director of the Bengal National Bank of Calcutta. He takes much interest in the voluntary Panchayat system and is the President of the Behar Panchayat Association. He was made an ordinary Fellow of the Calcutta University in recognition of his princely gift of 2½ lakhs, part of which has been devoted to the construction of a fine building for the library called "The Darbhanga House." He is a patron and president of many associations scattered over different places in India. He is also the President of the Calcutta *Sangita Samaj*, a very active philanthropic association.

He is the real head of the Maithil Brahman community in which he exercises considerable social power. All caste disputes are referred to his decision which is final. In fact, *he is the leader of Hindus throughout India*, who look upon him with reverence and respect. He is versed in English, Sanskrit, Persian, Urdu, Hindi and Bengali, and is a fine conversationalist. His range of studies is vast and varied, and he even now spends much time in studying books on different subjects. His collection of books in different languages is of the choicest kind. He possesses a very large and splendid library containing a fine collection of mostly English and Sanskrit books on various subjects, which is being augmented every month. He is versed in the esoteric lore of Hinduism and can unravel the mysteries and explain the rationale of Hindu customs, usages, rites and ceremonies with the knowledge of an expert. He has penetrated into the sanctuary of the Hindu religion. His researches into the profound spiritual truths of the Hindu religion in all its forms, makes him a strong upholder of orthodox Hinduism, the religion proclaimed by ancient Rishis, the ancestors of the Hindus, and no amount of sneers and taunts from

any quarter would affect him in the least. But, as already said, his orthodoxy is not of the blind and unreasoning order, but is full of the deepest meaning to him. He is a man of very active habits and high religious temperament and very devoutly performs his religious observances without regard to the great bodily trouble and inconvenience he has to bear on that account. He has travelled far and wide, and visited almost all the sacred places and shrines in India including the twelve *Jyotirlingams*, four *Dhamas* and seven *Puris*. At the time of the Gubana lake rising, he was in that quarter on a pilgrimage to Gangotri, and his life was then in danger. His habits are very simple, quite in accord with those of ancient Hindu personages, and he is very scrupulous in observing strictly Hindu rites and ceremonies. He occasionally performs severe religious austerities and penances, and observes long fasts. Hundreds of Brahmans are employed by him in various places for performing religious rites, and they are thus helped by him. He is very painstaking and often toils at his desk for nearly 5 hours at a stretch. He supervises the working of all departments of the Raj personally.

One most remarkable thing regarding him is that he has perfectly conquered *krodh* or anger which, in the words of Bhagwat-Gita, has been described as "all-consuming, all-polluting." He never shows anger even towards his menial servants, however provoking their faults may be. He celebrates annually Ganesh Puja, Indra Puja and Durga Puja with due solemnity and at considerable expense, when, besides the performance of religious ceremonies lasting for many days, various entertainments are provided for the public, to which people flock to witness from far and wide. At Darbhanga annually a *fête* called Sri Rameshwar Mangala is held in his honour which takes the form of a water carnival or procession and excursions of boats on a lake, and this is witnessed by

many thousands of people of all ranks and classes, as it provides excellent amusement to them all.

He maintains an English High School at Darbhanga, Sanskrit Colleges at Darbhanga and Benares, a Girls' School at Darbhanga, and eight Vernacular Middle Schools in various parts of the Estates. He granted a very handsome monthly subscription amounting to Rs 500 per month to the Muzaffarpore B. B. College at a very critical period of its existence and thus saved it from being made a second grade College. He maintains a large General Hospital and a Lady Dufferin Hospital at Darbhanga, one indoor Hospital and nine outdoor Dispensaries in various parts of his Estate. He possesses a splendid stud under the supervision of a European Veterinary Surgeon who has another European as his assistant.

He has built a very splendid palace at Rajnagar in Darbhanga district at a cost of £160,000. It is the finest example of the magnificent Oriental architecture in Bengal since the Moghul period. The palace is most picturesque and looks quite grand. It is very richly furnished, and is fitted with electric lights, fans, telephones, lifts, water-pipes, hammams, fountains, &c &c. He is at present constructing a marble temple at Rajnagar which will cost many lakhs. He has constructed temples at Darbhanga, Bankipore, Benares, Kamakhya, Kharagpore and other places, and has restored and constructed temples destroyed by earthquake in the Kamakhya, Sylhet and Kangra valleys at considerable expense.

He has presided over many important meetings and Conferences at Calcutta, Darbhanga, Muzaffarpore, Sonapore, Bankipore, Benares, Allahabad, Lahore, Meerut, Madhubani, Supaul and other places at which he has delivered most weighty and important speeches which are highly valued as containing the soundest and most practical views and counsels of wisdom. Their number will not be less than a hundred. To enumerate a few, I may mention the memorable sittings of Sri Bharat

Dharma Mahamandala at Delhi, Calcutta and Allahabad,—the latter being attended by such personages as Sri Saukaracharya of Gobaradhan Math (Puri), the first and second Sessions of the Parliament of Religions held at Calcutta (1909) and Allahabad (1910), the first sitting of the All-India Brahmana Conference at Lahore (1909) organised by such eminent men as Sir Pratap Chandra Chatterji, the Industrial Conference at Lahore (1909), at all of which he delivered speeches, which are considered masterpieces and valuable contributions to the subjects dealt with therein. Wherever he goes, he is accorded most enthusiastic receptions. The receptions accorded to him at Delhi, Allahabad and Lahore on the occasion of the sitting of Sri Bharat Dharma Mahamandal and the Brahman Conference sittings were memorable—the latter was attended by His Highness the Maharaja Bahadur of Kashmir himself.

On the demise of His Majesty the King-Emperor Edward VII, a grand and memorable Hindu demonstration was most successfully organised by him at Calcutta when the vast mourning procession of Hindus headed by him walked on foot from the City to the Maidan where His Highness read his speech expressing the grief of Hindus at the death of their beloved King and a vast multitude of the poor were sumptuously fed.

The Darbhanga Raj has always been famous for all sorts of charities, especially those of the religious kind, and the present Maharaja is fully and excellently maintaining this tradition. His principal charities are: Victoria Memorial Hospital, Muzaffarpore, Rs. 34,000; Famine Relief Fund (1900), 1½ lakhs; Queen Victoria Memorial Fund, 1 lakh; Calcutta University, 2½ lakhs; Bharata Dharma Mahamandal, Rs. 25,000; King Edward Memorial Fund (Bengal), one lakh; Patna Municipality, Rs. 25,000; Investment for Anathasala, Rs. 1,00,243.

Whenever famine has occurred in his estates,

he has gladly remitted a large amount of rent to the ryots and spent very handsomely on relief works besides constructing such works of public utility as canals, &c.

His recent princely gift of 5 lacs to the Hindu University, has been the crowning point of all his charities, as it is the biggest subscription which has so far been given for the purpose. This has evoked universal admiration, has gladdened the hearts of all beyond description, and most sincere blessings and prayers have been offered for him. Not only has he given a princely donation but he has also been instrumental in obtaining Government sympathy for the University scheme and securing the Central Hindu College for the Hindu University with the valuable co-operation of Mrs. Annie Besant. He is now leading the Hindu University movement and it is hoped that under his leadership the University will become an accomplished fact. He will shortly make a tour for collection of funds for the University and will head the deputation for the purpose. In returning the compliment of donation of Rs. 5,000 to the Hindu University by H. H. the Aga Khan, H. H. the Maharaja Bahadur donated Rs. 20,000 to the Moslem University, and the telegrams exchanged between them in this connection showed that each community welcomed the University of the other.

He has given Rs. 25,000 to the Calcutta Imperial Reception Fund opened to accord a suitable reception to Their Imperial Majesties in Calcutta, and as President of the Pageant Sub-Committee, he has taken great pains and trouble to make it a success. He twice visited Simla to confer with General Drummond on the subject, as the management of the Dussara processions has lain entirely in his hands.

In the twelve years ending with July 1910, i.e. since the accession to the gadi of the Maharaja Bahadur, the Darbhanga Raj has spent the following sums:—

<i>Pension</i>	..	Rs. 3,04,145 : 1 : 4½
<i>Donation</i>	..	" 12,07,202 : 11 : 10½
<i>Charities</i>	..	" 3,55,793 : 13 : 10
<i>Subs.</i>	..	" 2,74,910 : 8 : 9
<i>Religious Buildings</i>	..	" 2,53,585 : 15 : 8
<i>Public Utility</i>	..	" 2,11,010 : 8 : 0

Total Rs. 26,06,618 : 11 : 6 to which if Famine, and Anathalaya investment funds and the Hindu University donation amounting to Rs. 10,36,491 and 1,00,243 and 5 lakhs respectively are added, the total will come to Rs. 42,43,385.

He enjoys the confidence both of the educated classes and the Government on account of his deep patriotism and profound loyalty to the Government, and sound practical views on public questions—this unique combination makes him respected and loved by all classes. He is thus a great political asset both for the Government and the people and one of the very few men in India who can satisfactorily and successfully represent the true needs of the country to the Government and interpret to the people the true wishes and intentions of the Government regarding any Government measure, and thus establish harmonious and cordial relations between the rulers and the ruled.

His estates which are generally compact are situated in the districts of Muzaffarpore, Darbhanga, Monghyr, Bhagalpore, Purneah, Gaya and Patna, and also in Assam. There are nearly 15 European sub-managers and factory managers serving in Darbhanga Raj under a European General Manager. He has established a Bank at Darbhanga. He owns fine palatial buildings at Darjiling, Simla, Allahabad, Benares, Purneah, Muzaffarpore, and other places. He is possessed of a large and fine collection of valuable jewellery amongst which are such historic gems as the Dholepore Crown and the Nepal garland.

He has been instrumental in starting a well-conducted Hindi weekly paper which is published from Darbhanga and is named "Mithilamihir."

He has many times given excellent parties at Darbhanga and his Calcutta residences, notable among them being those in honour of Lord Curzon, Mr. Dadabhai Naoroji, Sir Edward Baker and His Highness the Aga Khan.

He is an expert at chess in which he has very few equals in this country, and is also a fine player at Rackets.

He has three children: the Maharaja Kumari born in the year 1905: the senior Maharaja-Kumar the heir-apparent, Maharaja Kumar Kameshwar Singh, born on the 28th November 1907, and the junior Maharaja-Kumar Vishveshwar Singh born in 1908.

On the occasion of his last visit to Delhi for the Durbar, he was accorded a most enthusiastic and grand reception at the Railway station by the public of Delhi headed by Hindu, Jain and Mahomedan leaders. On the occasion of the Delhi Coronation Durbar, he, under the instructions of His Honour the Lieutenant-Governor of the Punjab, organised a grand Hindu procession headed by himself for the purpose of offering prayers for Their Imperial Majesties on behalf of the Hindu community, and it was a complete success. Leaders of different Hindu sects and distinguished Pandits of different parts of India joined the procession and prayer-offering function. They all came in response to his invitation, and Sri Sankaracharya and many leading Pandits were guests at his camp.

On the morning of 16th December, the representatives of the Hindus, Mahomedans and Sikhs who took part in the prayer headed by the Maharaja Bahadur of Darbhanga were presented to Their Imperial Majesties at King's Camp, and as their leader, the Maharaja Bahadur was presented and introduced first of all by the Lieutenant Governor of the Punjab.

INDIANS IN THE TRANSVAAL.

BY MR. L. W. RITCH.

FOR sometime past I could not understand how it was that parents lawfully resident in the Transvaal, whose minor children came to South Africa with a view to entering the Transvaal, via Lourenco Marques, found it impossible to get beyond Portuguese territory and so to their homes. The complaints that reached me were to the effect that it was impossible to get railway tickets at Lourenco Marques, until the children in question produced permits from the Registrar of Asiatics. Now, the law is quite clear as to the right of minor children whose fathers are lawfully registered to enter this Province. There is nothing in the Immigration Law about permits being necessary for such cases. It, however, became quite clear as time went on that some sort of compact existed between the Asiatic Office here and the Administration at Lourenco Marques. I found means of circumventing them, advising the parents before they went down to fetch their children to purchase return-tickets on their behalf. This seems to have driven the Transvaal authorities to a further step. A few weeks ago five children were arrested by a Portuguese official at Rossano Garcia, a few miles on the Portuguese side of the border, and, because they could not produce permits, were compelled to return to Lourenco Marques, whence they had come (paying their own fare for the privilege). As soon as I heard of this, I communicated with the British Consul at Lourenco Marques, with the result that the children were released. However, with a view to investigating matters, I went down to Lourenco Marques, and learnt from the Consul who is a courteous and conscientious gentleman, that the arrest was the result of a mistake. With a view to testing the truth of this, I accompanied a batch of about thirty

children a few days later. I took the tickets for them at Lourenço Marques and all went well till Rossano was reached. There, a Portuguese official entered the train, and went from carriage to carriage, demanding from all Indians their permits to enter the Transvaal. On my advice, they refused to discuss the matter with the gentleman, and I challenged him to interfere with them in any way. He evidently thought discretion the better part of valour, and we went through into British territory, where the whole party was promptly arrested because the children were unable to produce permits. The cases have all been remanded to Johannesburg, where the first batch will be heard to-morrow. I have communicated with my Committee in London, as also again with the Consul in Lourenço Marques, with a view to an investigation of this charge being made and any repetition being prevented. I have no doubt at all in my mind that here again the Asiatic Department of this Province has been at work. The whole thing is almost incredibly scandalous. It is bad enough that we have to fight our own Government without having to combat outside conspiracies of this kind.

The Government has fired the first shot with a view to enforcing the Gold Law and Townships Act. I have received a notice from the Government Attorneys to surrender my titles to a property recently bought in my name by Amod Moosa Bhvat, a prominent Indian merchant of this Province. The notice also requires me, under certain pains and penalties, to evict the occupants of the property. Mr. Bhvat has opened a large and modern business on the premises, and also lives there with his family and assistants. A meeting is in progress as I write, to discuss the position. So far as I am concerned, I have no intention of obeying the Government's demand, but this is a matter that may have to be carried far, and, unless it is fought out to a finish and that successfully, it means that every Indian

property-holder in the towns of this Province will have to surrender his property without compensation, and remove himself and his business into one or other of the compounds or locations. Both Mr. Polak and I have registered in our names considerable fixed property on behalf of more prosperous members of the community, and it is perfectly clear that the policy of the Government is, first, to beggar the people, and then, segregate them as the price of their remaining in the country at all. I need not, I am sure, do more than state the bare facts, which are sufficiently scandalous and require no comment.

[In connection with Mr. Ritch's article, the following report of a discussion on the question in the House of Lords which took place on the 19th of this month, will be read with interest by our readers.—*Ed. I. R.*]:—

In the House of Lords, Lord Amphill raised a debate on the question of Indians in the Transvaal. He asked regarding the allegations that the Portuguese at Mozambique forcibly detained Indians, while the Union Government permits were being examined with the likelihood of their deportation to India in consequence of the expiry of Delagoa Bay permits; whether minors were not allowed to accompany their parents and whether the Government had communicated with the Union on the subject. Lord Amphill said the Indian question was more than ever of enormous public importance.

Lord Emmott said the Colonial Office had no official information, but if representations were made Mr. Harcourt would consult Lord Gladstone in the matter.

Lord Amphill replied that he was surprised that the Government had no papers on the subject. It was pitifully disappointing that the matter should be allowed to remain where it stood. It was idle to say that they would interfere with a self-governing colony. He pointed out that all

CURRENT EVENTS.

BY RAJDUARI.

BRITISH POLITICS.

"ULSTER will fight." That was the war cry of the men of Belfast who have sworn undying vengeance to the introduction of Home Rule in Ireland. It has been heard before with the most hollow sound and with the fury out-mahading the most fanatic Mahadists of Soudan. There is in reality nothing to differentiate the fire-eating Ulsterians from the frenzied followers of the Mahdi. Ulster has said before and says it now that if it fights it is because it thinks the cause for which it battles is the right cause. "Ulster will fight and Ulster will be right." That was the refrain of Lord Randolph Churchill who befriended these wild men of Belfast some twenty-five years ago. But in the quarter of a century which has elapsed since that cry was raised, immense floods of water have flowed across the Irish Channel, so that the cry has lost all its force. Gladstone's first Irish Home Rule Bill has passed into oblivion. On its debris a new Home Rule plan has been devised of which the key is devolution to the proposed Irish Parliament, all legislative affairs for the better government of Ireland which the Irish themselves could manage. To those who have closely followed the trend of events in Ireland during these many years past and the proceedings of Parliament at Westminster, it cannot but be apparent that such a devolution has become an absolute necessity if the large problems of Imperial Government are to be satisfactorily considered and disposed of. For years past the work on this account has been growing and accumulating. As a result it has to be performed either perfunctorily or postponed from time to time. To relieve this congestion has become imperative. It could not

be allowed to hang on. It is not only Imperial affairs that lag behind but many local affairs of first importance which under existing constitution have necessarily to be disposed of by Parliament. Scotch and Welsh affairs as much as Irish, which are of paramount local importance and which could be best disposed of locally by a local legislature must therefore be devolved on local bodies. Then only the congestion could be removed and the Imperial Parliament find sufficiency of time to deliberate on affairs of Imperial policy with greater leisure and maturity of opinion. International politics are now-a-days of such primary and vital concern to the nation that if they are to be looked after to the satisfaction of the nation, no other course remains but devolution—devolution of Irish affairs to the Irish people and devolution of Scotch and Welsh affairs to the Scotch and Welsh respectively. It is inevitable and it is utterly futile of the fanatic Ulster man to arrest the inevitable. So that the old battle cry, whether rightly or wrongly raised a quarter of a century ago, has lost its significance in view of the new and complicated factors that have since risen and overwhelmed Parliament. For Ulster now to fight is not only far from right but senseless. Why Lord Londonderry, Sir Edward Carson and their supporters and followers fomented their organised revolt against the Ministry is not apparent. Worse still is the organised opposition they offered to Mr. Winston Churchill. It was intolerable to give him no chance freely and fairly to meet face to face the men of Ulster and propound to them what the new Home Rule Bill will mean. It is something that the pressure of enlightened British public opinion eventually shamed the leaders of the organisation into abandoning their original intention to make it so hot for that resourceful and intrepid Minister as to prevent him from speaking. All through this seven weeks' war of hollow sound and irrational fury that capable young Member of the Government seems

CONTINENTAL.

On the Continent the new German Reichstag has been most conspicuous for the talk it has given rise to among all the great Powers. Despite the mailed fist the Socialist organisation has triumphed. It has won with flying colours many a seat. The strength of the parties is that the Socialists command 110 votes, the Centre 99, the Conservatives 68, the National Liberals 96, the Radicals 50, and non-descripts 26—say 397 in all. Were the seats re distributed, as they ought in all fairness to be, the Socialists would get 130. Their most sensational triumph was in Potsdam. The Centre has lost 10 seats. Their greatest defeat and humiliation was in Cologne. Their abject support of Catholics and their attitude of *non possumus* in reference to popular measures of reform have cost them this loss. Chauvinists as the National Liberals are called have gained nothing. The German Government finds for the first time that it has no clear majority. They cannot embark on additional costly armaments against the popular wish which in this matter is determinately opposed. Social reforms, for the better welfare of the populace, are urgently demanded and until these reforms are achieved the Government is bound to meet with many defeats and even rebuffs. No combination of groups is possible. The Reichstag may be dissolved at an early day but the Emperor is doomed to disappointment if he thinks he can get back his majority. The political lesson taught by the German election ought not to be lost on him.

In the death of the distinguished Count Aehrenthal Austria has suffered a distinct loss. But for the masterful Foreign Minister the annexation of Herzegovina and Bosnia would not have been so easy. But it is too premature to pass a verdict on the deceased Minister so far as his Foreign policy was concerned. Suffice to say it was a bold one not unmingled with Jesuitical ethics. But they say that in foreign diplomacy and action the end

justifies the means. In Hungary, there is a great tension and the recent establishment of a Catholic Bank has created a great deal of sullen dissatisfaction which will bode no good. The leading clerical organs are very bitter and adding fuel to the fire which any day may lead to a big blaze. Anyhow all may go well for the brief span of life which yet remains to the aged Emperor; but there can be no two opinions on what may follow in the wake of that near contingency.

Holy Russia is once more in the throes of a severe famine which for relief would demand as many as 16 millions sterling. But even then the condition of the Russian agriculturist will be far from happy. Meanwhile, famine or no famine, the progress of the Military and Naval Races goes on merrily. Russia is fast building up her Navy to retrieve her disaster in Japanese waters. There has been a talk of friendly relations with Austria; while domestic affairs seem to be all at sixes and sevens.

King Alfonso is stirring the country and necessarily playing to the popular gallery in view of the sad catastrophe that has fallen his next door south-westerly neighbour. The Carlists gave some trouble lately but it is doubtful whether they can ever regain the day. The tension with the clerical continues.

The Italo-Turkish War drags on its slow existence, mostly of a drivelling character. Hinterland has become a kind of another Alsatia for King Emanuel. But the Turks are determined to fight tooth and nail. There was a *balcon d'essai* to the effect that Turkey should make her peace with Italy by accepting the solatium of a few million *lirs* for the loss of Tripoli. But the brave Turk has a soul above such sordid consideration. He has openly declared that never would he enter into such an unhallowed bargain—an exchange of territory for a mess of pottage. Meanwhile he has entered on a vigorous campaign of

boycott as a reprisal. The Italian is proscribed in Turkey and the Italians are notified to quit the country bag and baggage with their belongings "Served them right" says the righteous world of civilisation.

ILL-FATED PERSIA

Neither Sir Edward Grey's previous apology nor the one lately offered to Parliament has removed by an atom the growing conviction of the British people that by his utter pusillanimity he has sold Persia to Russia, never mind however ingeniously and sophistically he may labour to prove that all his conduct and action in Persia has been in harmony with the Convention and a serious effort to prevent the *status ante quo* which would be so disastrous to India. It is with this kind of contemptible bogey that he has tried to frighten the nation into an acquiescence of his policy. But it is needless to say it has given no satisfaction. There is now before the nation the other side of the true account of British subservience to Russian diplomacy as so graphically given by Mr. Shuster in London. He has courageously unmasked the entire cunningness and base dissimulation of the Russian and shown how weak and hollow is Sir Edward Grey's laboured rigmorole. When such an independent and impartial non-partisan journal of first rate repute as *The Economist* observes as follows in its issue of 27th January last, it may be taken for granted that Sir Edward Grey's period of office is doomed. Aye, aye. He has really by his own mouth convicted himself as "an impossible Foreign Minister." "Sir Edward Grey's excuses about peace are refreshing but not convincing. Our reply to Sir Edward Grey and others is: if he could not maintain the Convention, why did he make it, and why should Great Britain be *particeps criminis* in its violation"? That is the crucial question to which Sir Edward Grey has not made any reply in his recent exposition of Persian affairs before Parliament.

Indeed, it is quite sickening to criticise the many amazing sins of omission and commission of Sir Edward Grey in Persian affairs. He has ridden to a fall. But in order that the fall may not humiliate him the King, in anticipation, has rewarded him with a *K. G.*

CHINA.

Affairs in China have so far improved that the Son of Heaven has issued a "decree" (what a mockery for a sovereign driven away from his throne by the might resistless of destiny) agreeing to form a Republic in harmony and in obedience to the wishes of his loyal people? There is a Gilbertian irony about the whole thing which is indeed refreshing. In reality, by virtue of this decree the Manchu has signed his own death warrant. He may now retire to his native stronghold on a fat "Imperial" pension. The Republic, however, is proclaimed. Dr. Sun-Yat-Sen has resigned in favour of the One Suoeng Man of China, Yuan-Shu-Kai as the President with his capital at Nanking. Peking and the Manchu are correlative terms. It would not suit the Republic to have its capital in hated Peking. The new capital must be de-located from all Manchu traditions and therefore the old capital must be revived after too and a half centuries. It remains to be seen whether the great Powers will recognise the Republic.

DALAI LAMA REDIVIVUS

Of late there have been appearing a variety of gossip in the Anglo Indian papers of the early transplantation back of the much-hated and universally condemned Dalai Lama back to Lhasa. The fact is that the wish is father to the thought. *Those organs of opinion* who had foamed at the mouth on the scuttling out of Tibet are now moving heaven and earth by means of an organised conspiracy to rehabilitate the Lama whom they once hooted and hissed and hounded in order that he may be supreme at Lhasa for their own objective. The movement is sinister and should be carefully watched and the reader should be cautioned against the accuracy of the many statements now daily appearing in the Curzonian organs of Chauvinism both here and at home.

Diary of the Month, Jan.-February, 1912.

January 28. A *Gazette of India Extraordinary* notifies that Sir Reginald Craddock has taken over the duties of a temporary Member of Council of the Governor-General under the usual salute.

Prince and Princess of Teck, having returned from Seringapatam, Cuvery Falls and Mysore, attended the parade service of the 7th Hussars and the Royal Artillery Brigade at the Holy Trinity Church, this morning, where the Bishop of Madras preached an impressive sermon.

January 29. The Viceroy and party arrived this evening at Dacca. The entire route was decorated, and crowds lined the streets to welcome His Excellency. He was presented with an address from the Dacca Municipality.

January 30. At a Meeting of the Punjab Chiefs' Association, Sirdar Daljit Singh, of Kapurthala, was elected Secretary in place of his brother, the late Sirdar Patpat Singh.

January 31. It is announced that the Czar has granted a pension of 10,000 roubles yearly to Count Tolstoy's widow.

February 1. The King presented Colours to the South Staffordshire Regiment and conferred the Grand Cross of the Victorian Order on General Sir Archibald Hunter.

Sir Shapurji B. Broacha has forwarded the Bombay Electric Supply and Tramways Company's Preference shares of the value of Rs. 1 lakh, bearing interest at the rate of 5 per cent. *per annum* to the Trustees of the Bombay Parsi Panchayat Trust Funds, with a request to keep the whole amount in trust, and utilise the interest in giving relief to destitute Parsi widows and orphans. To-day's market value of those shares is Rs. 1,20,000.

February 2. The following Press Communiqué issued in the Home Department:—Under Section 3 of the Indian High Courts Act, 1911, (1 and 2

George 5 cap 18), the Governor-General in Council has been pleased to appoint the Hon'ble Mr. W. Tannon, I. C. S., Superintendent and Remembrancer of Legal Affairs, Eastern Bengal and Assam; Mr. Syed Hassan Imam, Barrister-at-Law and Mr. Asutosh Chaudhuri, Barrister-at-Law, to act as Additional Judges of the High Court of Judicature at Fort William in Bengal for a period of two years, with effect from the dates on which they take their seats in the said Court.

February 3. A public meeting of the citizens of Calcutta was held this afternoon at the Town Hall to give expression to their profound sense of the beneficent and far-reaching results produced by the Royal Visit.

Dr. Rash Behari Ghose was voted to the chair.

February 4. Mr. E. L. Weston, Assistant Director of Public Instruction, Bengal, died at St. Xavier College, Calcutta to-day from the after effects of internal injuries, received in the autumn by a fall from his horse.

February 5. The *Medina* arrived fourteen hours before she was expected, and caused a sensation in Portsmouth. The King and Queen dined on board.

The meeting between the King and Queen and other Royalties will take place this morning, before Their Majesties leave for London.

February 6. A unique gathering was present at the Mansion House to-day, at the Banquet offered by the Lord Mayor to the Provincial Mayors and Provosts who welcomed King George on his return to England from India.

February 7. Sir Edward Grey was received in audience at Buckingham Palace to-day, after which Lord Lansdowne spent half an hour with King George.

The death is announced of the Rev. George Roy Badenoch, Editor of the *Asiatic Quarterly Review*.

February 8. The Right Hon'ble Amir Ali presided at a farewell reception in honour of

the Red Crescent Corps, which has been engaged for six months. Further funds are solicited for hospital work and the relief of famine stricken women and orphans.

February 9. The death is announced of Sir Henry Oakley (formerly of the Indian Educational Service). He was aged 79.

February 10. At a meeting of the Dacca Association this evening at the Bar Library, the following Resolution was passed.—“That the members of the Dacca Bar Association have learnt with alarm and anxiety the announcement that the Government of India have decided to recommend the constitution of a University at Dacca and also a separate Educational Department with a Special Education Officer for East Bengal and do place on record their respectful but emphatic protest against the aforesaid measures as unnecessary and calculated to be detrimental to the best interest of education in this part of the country.”

February 11. A largely attended public meeting was held this evening at Faridpur in the Mela pavilion, presided over by Babu Caminkumar Mukerjee, President, Bar Association, to protest against the proposed University for Dacca.

February 12. The death is announced of Mr. Delaunay Belleville, the inventor of the boilers that bear his name.

February 13. Sir Edward Grey has been appointed a Knight of the Garter.

The papers point out that the honour conferred on Sir Edward Grey is a signal mark of Royal confidence, he being the first Commoner to be so honoured since Sir Robert Walpole.

The Earl of Durham has been appointed a Privy Councillor.

February 14. At the meeting of the Madras Legislative Council to-day the following Resolution moved by the Hon. Mr. Atkinson and seconded by the Hon. Mr. T. V. Seshagiri Aiyar was unanimously passed.—

That there be recorded in the Minutes of this

Council an expression of the gratitude of the Council for the services rendered to this Presidency by the late Hon'ble Mr. V. Krishnaswamy Iyer, C.S.I., Member of Council, and also an expression of regret by this Council at the loss which His Majesty's Government and this Presidency have sustained by the death of Mr. Krishnaswamy Iyer. Secondly, that this Council offer an expression of deep and respectful sympathy to Mr. Krishnaswamy Iyer's family in the sad calamity which has befallen them in his death.

The following Press Communique is issued:—His Majesty the King Emperor has been pleased to approve of the appointment of the Right Hon'ble Lord Pentland to be Governor of Madras in succession to Lord Carmichael.

The following has been issued to night from the Private Secretary's Office:—His Majesty the King Emperor has been pleased to approve of the appointment of the Hon'ble Sir Jones Meaton, K.C.S.I., to be Lieutenant Governor of the United Provinces in succession to the Hon'ble Sir Jones Hewett, when the latter retires in July next.

February 15. Reuter cables that the Queen has presented the Indian Section of the Victoria and Albert Museum with a series of beautiful and interesting examples of Mogul, Rajput and Tibetan industrial art.

February 16. In addition to the Order of Hanedan Ali Osman, the Sultan has conferred upon King George the Order of Nishan-i-Imtiaz, set in brilliants. The simultaneous bestowal of the two highest decorations is unprecedented.

February 17. The aviator, Mr. Graham Gilmour, was killed while flying in the Deer Park at Richmond to-day. He had started from Brooklands on a new baby monoplane, and when at a height of 400 ft. the machine buckled. He was killed instantly.

February 18. A number of arrests have been made in Seoul, Korea, in connection with a plot

to assassinate Count Terauchi, the Governor-General. They include Baron Inchiko, ex-President of the Privy Council and President of the Y. M. C. A., in Korea.

February 19. In the House of Lords to night, Lord Ampthill raised a debate on the question of the Indians in the Transvaal.

The Franco-Japanese Treaty of Commerce and Navigation has finally been passed by Parliament.

February 20. The House of Assembly (Cape Town) by 72 votes to 34 rejected Sir Leader Jameson's motion attacking the Government for unfair treatment of civil servants, after a speech by Mr. Hertzog quoting a mass of evidence showing that appointments were in the interest of the service, and were totally dissociated from racialism, nepotism, and jobbery.

Dr. Jameson hoped that the Government would give an assurance that the change of system was conducing to contentment. He maintained that Mr. Hertzog had failed to disprove Mr. Jagger's indictment that the Ministry of Justice was recking with racialism, favouritism, and jobbery.

February 21. In the House of Lords this evening, Lord Curzon, after taking his seat as an English Peer, called attention to the changes announced at the Delhi Durbar, and moved that papers be laid on the table in connection therewith.

February 22. In the House of Lords this evening, Lord Minto, speaking for the first time since his return from India, resumed the debate on the Durbar announcements, and said he hoped that the King's visit would stamp the relations of the British and Indian peoples with everlasting friendship.

February 23. H.E. The Viceroy presided at the Meeting of the Imperial Legislative Council to day, and before the proceedings of the Council began, His Excellency made a handsome reference to the death of Sir John Jenkins.

THE WORLD OF BOOKS.

[Short Notices only appear in this Section.]

English Philosophy: A study of its method and general development. By T. M. Forsyth, M. A., D. Phil (Edin), London: Adam and Charles Black.

We welcome this handy little volume on the development of English philosophical theories and methods. It is an excellent *resume* of the various English philosophical theories from Hobbes to the modern time, and the essential feature of the book consists in the remarkable delineation of the correlation that exists between the development of such theories and the development of method. Every new advance in philosophical thinking means also an advance in the method by which the results are obtained. This relation between method and doctrine is more interesting and instructive in the English development than in any other. Experience is taken as the starting and basis, and the differences of doctrinal conclusions reflect differences in that method.

The book is written in a fine style, neither too simple nor too technical. It is its special merit that it can be understood even by the ordinary student of philosophy. It is the pride of the English thinkers that they always avoided the mystic, and laid stress on whatever was amenable to sense-observation. As we have remarked, they made their philosophical theories rest entirely on experience, and it is the development of this conception of experience as the basis of philosophic thinking side by side with the development of this thinking itself, that is made by Dr. Forsyth the uniting thread by which all the speculations of the English philosophers from Bacon and Hobbes to Green, Bradley and Hodgson, are made to hang together. The expositions are interesting and accurate, and the estimates are fair. We heartily recommend the book to every student of philosophy.

where is Heaven. *By E. P. Berg (William Rider & Son, Ltd., London)*

E. P. Berg offers this book as conveying a cheering message to those that have almost lived out their lives and have begun to feel the effects of the cruel hand of Time. They are told that the soul is immortal, that after this earthly vesture is laid aside the soul gets a spiritual vesture of eternal youth and is admitted as a co worker with God in the training of human souls to His own likeness. God is our Heavenly Father, and it is hence extremely unlikely that he will forsake His sons instead of continuing their existence in another sphere. He has made us spiritually akin to himself in potentiality here, and in full realisation afterwards. The present life is incomplete, and if we are meant for perfection, we cannot cease to exist but must go on progressing until realisation comes. That we gradually advance nearer to God, and that we have a longing for immortality are in themselves sure indications of such immortality. The effect of sin is moral degradation, and God's punishment is remedial, not vindictive, intended to win the erring soul back to Himself. Heaven is not a place, but a certain state of the soul in which it is imbued with the lofty and divine principles of love and service which animated Jesus.

Our author teaches the above lessons in modern Christian theology in a series of letters addressed to a dying friend, preaching words of wisdom and solace, and seeking to instil the hope that the future life would be brighter than the present. In a simple, child-like way the writer bases the arguments for immortality on the basic principles of the Christian religion. We are sure the book will have its intended effect in the case of a large majority, as men are prone to derive solace from such lessons particularly in their last moments when the thought of their separation from the life's enjoyments is apt to be keenly oppressive.

Hazell's Annual for 1912. (*Hazell, Watson and Viny, London*)

Hazell's Annual for 1912 is a helpful guide to the great political questions of the coming year. Its interests, however, are by no means confined to politics nor even to the more serious phases of social and religious progress. Music, Art, Sport, and the Drama all have due space accorded them, and among new features we welcome a review of the Books of the Year, a map of the territorial changes in the French Congo, and a Diary—extending over eleven pages—of notable events. The mass of information contained in the volume is rendered readily available by a very full and clearly printed index. The Annual is an almanac and an encyclopædia in one, and while it is indispensable to the politician, the writer, and the preacher, it commends itself by the variety and authenticity of its information to everyone else who wishes to be well informed.

English Composition. By F. J. Rahtz, M.A. (Methuen & Co)

This useful book of Mr. Rahtz must be in the hands of every teacher of English composition working with the elementary classes. The special methods adopted in the book are bound to quicken the somewhat languid interest usually shown by pupils in that subject. A very successful attempt has been made to bridge the gulf that generally exists between composition and other subjects.

Power Through Thought-Control. By Marion Lindsay, London. (L. N. Fowler & Co)

This is a short but interesting pamphlet of the New Thought School, wherein the importance of thought as a force is explained, and the achievements of thought control referred to. It brings out in choice language the value of mental control.

TOPICS FROM PERIODICALS.

The Ancient Scriptures and Modern Life.

This forms the subject of an article by Prof. P. K. Telang of the Central Hindu College in a recent number of *Modern Behar*. The unbiassed mind with which the writer approaches the subject makes it particularly interesting. Prof. Telang observes :—

"Now, it is true that we have by no means reached our majority yet, nor even years of discretion: but we have certainly outgrown leading-strings and go-carts. It is, therefore, time that instead of trying to make out that we are anxious to follow the injunctions of the Shastras to the very letter (a proceeding which involves a great deal of deception and even self-deception) we should boldly and manfully, as befits Aryans, make up our minds to assimilate the spirit of the Shastras, which will save us, while we shake ourselves free of the letter which killeth and the vast wilderness of particular rules which would drag us down. History paints in glaring colours the tragic fate of the Hebrew nation which, in spite of warnings from the Son of God Himself, preferred the letter to the spirit of their Law and so involved themselves in irretrievable ruin."

"Can we as self-respecting, truth-loving, men and women honestly say that we value and respect the Shastric rules? There is not a single rule or ordinance of the Shastras that we have not most flagrantly broken or so whittled down with our self-seeking casuistry that it has been rendered absolutely unrecognizable as Aryan. Nay, we have set at naught the very Sanatana Dharma that forms the foundation of these rules, and, as the inevitable consequence of this breach are suffering degradation and misery. We have broken all rules, we have upset all principles of individual purity, of social polity, of spiritual felicity. And we have

done all this either for the bag of gold or the flash-pots of Egypt, for social prestige or for earthly power: very, very rarely indeed have motives of pure and generous Aryanism moved us. We have also allowed the strong hand of the foreigner from time to time to run his scimitar through our Shastras and often enough have we borrowed from the enemy of the Shastras his un-Shastric methods and practices. The consequence has been that what stalks through our streets as Hindu orthodoxy is a tear-compelling mixture of all sorts of elements which whatever else they may be, are certainly not purely Aryan. And still has this hybrid creature the temerity to point to the letter of the Shashtra and cry heresy at everything that attempts, by a thorough understanding of Sanatana Aryan principles, to relieve our sad state by bringing-back amongst us the ancient principles of freedom, of justice, of spirituality. Let us end this once for all. The path of reform lies clear and defined, already mapped out in broad detail if we would but see with eyes rendered clear and piercing by living and realizing the Dharma Sanatana."

There can be no sounder advice given to our orthodox Hindu brethren than that contained in the following lines :—

"Let us in the name of the Blessed Rishis stand out manfully for the ancient Aryan lore and culture: but let us not forget that we stand in danger of being led into a bog by a dead literalism, a mechanical orthodoxy, a false Aryanism. Our salvation lies in taking a firm stand in the Sanatana, the Eternal and in making a firm stand against the conditioned, the relative.

The Trials in the Transvaal.

Mr. S. S. Adajaina gives a careful account of "Our Trials in the Transvaal" in the January number of the *Indian World*. The nature of these trials is familiar to all. In the agitation to get them remedied Mr. Gandhi has indeed played a most important part. His powerful influence was exercised to strengthen the bond between the Muhammadans and the Hindus suffering together in distant Africa. Consequent on their brave refusal to do the obnoxious Registration, thousands of Indians have suffered imprisonment under very brutal circumstances aggravated by a very cold climate. But their organised, though painful agitation, has not been without some success.

At last the Union Government introduced the General Immigration Bill, but it was not accepted by us. So the Bill was withdrawn, and a settlement was effected between Indians and the Union Government, by which the obnoxious Registration Act is to be repealed, and there will be no racial bar in the Immigration Registration Act. The educated Indians who will enter now will not be called upon to register. Besides these, the prestige of the Indian community now stands much higher than it did five years ago. The greatest good achieved is the stoppage of indentured labour. The Government has now to consult our leaders before they pass any legislation affecting the Asiatics, and there are many other advantages derived from the struggle.

But this has been achieved with no small difficulty.

Two precious Indian lives have been lost, and one Chinaman committed suicide. More than 3,000 men have gone to gaol and undergone the worst sufferings. Men were sent to gaol time after time, many an Indian home having been ruined and thousands and thousands of pounds lost. Our women acted heroically throughout the whole struggle.

Mr. Adajaina concludes by paying a tribute to all who have been helpful in the cause of their troubles, and he can count among them several Englishmen, a generous German, Jew, and Indians.

Moslems and Indian Interests.

The Moslem World of January has an interesting article on "Moslems and Indian Unrest" by Mr. S. M. Mitra. Mr. Mitra begins his article with an answer to the question who are the Moslems of India? "Hindu blood," says Mr. Mitra, "does not run only in the veins of most of the middle and lower class Indian Mahomedans, but is to be found in such of the highest members of the Mahomedan aristocracy as are descendants of the Mogul Emperors of Delhi."

It will be seen that since 1605 no less than six Mogul Emperors of Delhi, viz.: (1) Jahangir, (2) Shah Jahan, (3) Bahadur Shah I. (4) Ahmad Shah, (5) Alamgir II., and (6) Bahadur Shah II., out of a total of twelve, have been by Hindu mothers. In other words, half the number of Delhi Emperors of the seventeenth, eighteenth, and nineteenth centuries have been sons of Hindu women. Some of the daughters of these Hindu ladies—wives of Moslem Emperors and nobles—were married to the Mahomedan aristocracy of India.

And in tracing in outline the history of the relations between the Hindus and Mahomedans Mr. Mitra says:—

The *entente cordiale* that existed for centuries between the Mahomedans and Hindus in India was, no doubt, greatly due to the influence of the Hindu mothers of the Moslem Emperors and Chiefs in India. This *entente cordiale* is based on moslems respecting some Hindu customs though opposed to Moslem ideas, and the Hindus cheerfully following some Moslem practices though conflicting with their religious traditions.

Mr. Mitra gives instances, where in more recent times Hindus and Mahomedans have "joined hands in military operations and revolutions and have made common cause."

Mr. Mitra says—and it may be said that this is the central idea underlying his essay:—

My point is that there has been, and is, sympathy between the Hindus and Mahomedans: they do not willingly tell of each other. If the Mahomedans did not sympathise with the Hindus in the present unrest, the Hindus could not possibly have taken to violence without the authorities receiving information in time to enable them to act. The Mahomedan lives side by side with the Hindu in all Indian towns. It is impossible for the Hindu to continue practice with revolvers or bombs without the sound of gunpowder explosion attracting the attention of a Mahomedan neighbour,

Rulers and Ruled in Ancient India.

Prof. Jogendranath Samaddar contributes to the January number of the *Hindustan Review* a short article on "The Rulers and the Ruled in Ancient India."

"I doubt," writes Mr. Samaddar, "whether there is any other country in the world which can compare favourably with the ideal which the Hindu *Shastras* uphold before us, regarding this important question. In many of the *Suktas* of the Rig-Veda the king is worshipped as a God and all are enjoined to worship him as such. The priest in the Rig-Veda says, 'O king! we place you on the throne! Be thou the lord of this country! Let all the subjects adore you! May thy kingdom be never destroyed!' The law-giver Manu says, 'Do not think lightly of the king, even if he be a boy.' In another passage, he says 'If the king remains pleased, the whole kingdom thrives. If the king is displeased, the whole kingdom suffers. He, in fact, is all in all.'"

The two great Indian epics—the *Mahabharata* and the *Ramayana*—have enjoined upon all subjects the most devoted loyalty to their king, as witness their sayings:—

"The kings are the originators of all peace and of all religious duties. So to serve the king under all conditions should be the bounden duty of all subjects."

"Do not talk lightly of the king, as you would do of a man. The king is the earthly god." "Those men who would think well of the people, should consider the king as the highest in the land. As the disciples adore the guru (spiritual guide), so should the people adore their king." "The man who thinks ill of the king, even in his heart of hearts, will surely suffer and in the end is certain to go to hell."

But all this duty was not one sided. Such advice as is contained in the following texts from *Manu*, *Mahabharata*, *Agni Purana*, etc., show that according to the conception of our ancestors, the duties of the king and his subjects were reciprocal:—

"The king should treat his subjects as a mother does."
 "As a mother forbears from all luxury for the sake of the child in her womb, so the king should do those things only which are conducive to the good of his people."
 "You should perform those acts which lead to the benefit of the people, though it may interfere with your desires and pleasures."

"As the pregnant mother forbears everything for the sake of the child in the womb, so should the king do for his subjects which are under his protection." "As the duty of the king consists in protecting his subjects with justice, his observance leads him to heaven. He who does not protect his people or upset order, wields his royal sceptre in vain."

Islam and the Purdah.

Mr. Mir Sultan Mohideen has a paper on "Islam and the Purdah" in the *Muslim Review* in the course of which he says:—

We boast having, according to the Koran, given the highest place to women compared to other nationalities, but of what use are all these while their very existence is to be in seclusion as birds in cages. We have made it an easy work for competing races by imprisoning half of our number. While every nation on the face of the earth is doubly strong we are single-handed, with the weight of the other half, hanging on us and making us come down on our knees before the world's progress.

The Koran says, "let women go about without covering their faces and hands." The greatest of the commentators of the Koran are all agreed on this point. The right Hon'ble Ameer Ali explains it in his book *The Spirit of Islam*. His Highness the Aga Khan, the religious head of a large section of the Muhammadans, publicly denounced it as President of the Muhammadan Educational Conference of Delhi. Her Highness the Begum of Bhopal, and Her Highness the Maharani of Baroda are now in London, freely moving about and teaching by their example the unfortunate women in India to release themselves and enjoy God's freedom. The simplicity with which His Highness the Maharaja of Baroda travelled about with his Zenana is a good lesson to lovers of false pomp and vain grandeur.

The Depressed Classes.—A Symposium by His Highness the Gaekwar of Baroda, Mrs. Anne Besant, The Hon'ble Mr. Gokhale, Sir Valentine Chirol, Rt. Rev. The Lord Bishop of Madras; The Hon'ble Sir Narayan Chandavarkar, The Hon'ble Mr. V. Krishnaasami Aiyar, The Asanganika Dharmapala and others. Price One Rupee. To Subscribers, Rs. 12.

The Partition of Bengal.

In the course of a characteristically vigorous article in the January number of the *Empire Review*, Mr. C. J. O'Donnell discusses "Lord Hardinge's Partition of Bengal." There is, an interesting expression of opinion in the concluding passages of the article, from which we make the following quotation:—

Up to the period of partition disorder or ill-will had been unknown in Bengal. . . . This was the state of things when the Liberal Government came into power at the end of 1905. During the debate on the Address in February, 1906, the case of Bengal was laid before Mr. (now Lord) Morley. A few ex-members of the Indian Civil Service had just been returned to Parliament, and they unanimously condemned the partition and warned the Government of the danger of leaving it uncorrected or unmodified. The Secretary of State for India declined to interfere, and decided to treat Lord Curzon's measure as "a settled fact." No other course seemed open to Lord Morley. In practical politics it is generally recognised that the assertions of the omnipotence of the law must precede reforms or conciliation. The struggle went on for five weary years, and although crime has not entirely disappeared, order is now generally maintained.

Lord Hardinge has taken advantage of the great amelioration in the condition of affairs, and refusing to blight his administration by another five weary years of conflict, has decided to deal radically with the intense discontent, which was still directed against the partition in its existing form. It has been asserted that the agitation against Lord Curzon's measure was dying out. This is certainly true as regards its violent and criminal manifestations, but no one who reads the vernacular journals or the speeches of Indian members of the Legislative Council can be in any doubt that smouldering discontent and anger pervaded the whole province. Lord Hardinge was beyond all question accurate in stating in his great despatch of last August that "there was reason to fear that, instead of dying down, the bitterness of feeling would become more and more acute."

Baba Bharati on Indian Education.

One of the most noteworthy articles in the new *Nineteenth Century* is one by Swami Baba Premanand Bharati, who under the heading: "How King George can win the hearts of the Hindus" plunges into the conflict of Western civilisation with Hinduism. The Swami emphasises that he has "never been a political person either when I belonged to the world or since I have renounced it." He speaks of the recent Durbar as the occasion of the crowning of the Emperor, describes previous Durbars, when the "formal declaration of the assumption" of rule by the Sovereign was proclaimed, as sorry farces. His principal argument is that the modern Western education imparted in India is "killing the Hindus mentally and morally."

"This new English system of education is so nauseatingly materialistic, all-intellectual and soul-killing, that the Hindu mind, being essentially spiritual, has failed to assimilate it. Its fine spiritual stomach cannot digest such gross intellectuality and materiality. The result is the unhinging of the mind, brain, heart and soul. This is intellectual insanity, or electricity, if you will, and its extreme cases have produced the "anarchists" who concocted plans for freeing India from the British yoke by bombs and pistol-shots."

It is robbing the Hindus of the jewel of their soul, and the remedy:

"The Hindus must be given their own literature, their religion, philosophies and Shastras to study in the beginning, in order to build a foundation, and upon that foundation you can raise a super-structure of modern wisdom in a mixture of old and new styles, built with the bricks made out of their old-world national mentality."

This is the ideal the Swami would like to see pursued not only in higher education but still more emphatically in primary teaching, and along with it he would enact the prohibition of cow-killing.

The New Departure in India.

Dr. J. Beattie Crozier, in the *Fortnightly Review*, lays down a few rough general principles for the government of India, suggested by his own special studies on the Constitution building side of Sociology. The first part of the article is devoted to an exposition of the reasons which have rendered it very easy for us to establish our authority in India. The latter part of it deals with our prospect in the future. Dr Crozier thinks the one shadow, which is as wide as the sky is the modern political spirit which cannot be exercised or fought with carnal weapons. The most that we can do is to give it as free a vent, as wide an outlook, and as fair an arena as possible.

With regard to the Indian Princes, he would make up to them in "honours" for any ultimate political powers which the necessities of our supremacy must deny them. He would leave them to enjoy their own independent sovereignty as protected by their treaty rights, so much so, indeed, as if they were Afghans or Tibetans.

As to the young Europeanised Brahmins, he would grant them an equality of opportunity to all those positions and honours in their own country to which their abilities can carry them, even up to the Imperial Legislative Council. He would reform the methods of examination and education and give them the widest extension of authority in all the civil affairs of their own country, while reserving the supremacy of ultimate power for ourselves. He would not give any popular franchise.

As for caste he would try to dissolve it by indirect action from within, he would hand over the fifty millions of "Outcastes" to Christian missionaries. As for the people in general, he would offer them all alike a free and open primary education.

The Law Courts of Chandragupta.

Mr. Narendranath Law has written in the January number of the *Modern Review* the first of a Series of Articles on the Judicial System of Chandragupta and the Law administered by his officers. There were two classes of courts—"the courts composed of judges well-grounded in sacred lore" and "the courts for the removal of thorns." There appears to have been a difference in these two classes of courts, both as regards their composition and their jurisdiction. The former class of courts of these were presided over by, three persons well-grounded in the *Shastras* and three ministers who sat together for hearing cases; the former were most probably Brahmins,—the recognized depositories of sacred learning, and the latter the three judicial officers who supplemented the knowledge of sacred lore of the former by their knowledge and experience of the world.

The other courts were composed of,

three officers with their knowledge of the world and three "oversers" who, it seems, investigated the cases by enquiries on the spot when required, remained present at the time of trial and helped the three other colleagues.

As regards their jurisdictions, the first class of courts,

generally decided such cases as arose from the personal grievances of one or a few individuals against another or a few other individuals, and the punishments were only in fines—these fines being not even very heavy ones. The cases that came within the jurisdiction of the other class of courts generally related either to matters that affected the government, the king himself, the public at large and large bodies of men, or to such other heinous offences as murder. Though small fines were inflicted by this class of courts for offences that were not so grave yet the fines for the graver offences ranged up to a very high limit. Another distinction consisted in the fact that it lay in the power of this class of courts to inflict capital punishment with or without torture according to the gravity of the offences.

It appears that the headman and the elders of a village could settle disputes among the villagers, and the headman could inflict punishment in certain cases.

And:

the king with his ministers and learned Brahmins formed the highest court of appeal.

Citizenship of the Working Man.

In an article under the title of, "Citizenship of the Working Man" in the January number of the *Hibbert Journal*, Mr. Ramsay Macdonald, M. P., replies to an attack on the policy and methods of the Labour Party made by Professor Henry Jones, of Glasgow. Professor Jones stated: "If I had the power, as I have the will, I would arraign the Labour Party before the national conscience and ask it to show cause why it should not be condemned for corrupting the citizenship of the working man." This sentence was a preliminary to an indictment against modern methods of political controversy which are responsible for discussions disfigured and degraded by misrepresentations of facts, looseness of argument, unfairness of spirit, and the reckless use of opprobrious epithets and accusation of ignoble motives. Mr. Macdonald most strongly protests against the Professor's attempt to attribute to the Labour Party failings which have received uncompromising chastisement at the hands of the Labour men and says that such attacks, with neither substance nor excuse, tend to keep the Labour Party alienated from, and a little contemptuous of, the professional frame of mind. While admitting that the Labour Party is not free from imperfections, and may at times even fall on the mud and lapse into the very errors of which, as a party, it has been the sole combatant, Mr. Macdonald observes.—

Whoever is at all likely to understand the Labour Party's possibilities for good must, first of all, understand how to regard its shortcomings, for, the party is not to be frightened out of existence by scoldings from the dainty minds of University professors. On wide fields of life the party has little experience—as yet; it has come into an inheritance of entanglement and disorder. . . . Its recruits have had but scanty training except in factories and fields, and when called upon to lead in politics they have to lay aside old tools and pick up novel ones. . . . Not a man among us in Parliament has set its

foot inside a University class room to be taught Its (the Party's) simplicity of thought and appeal convey more real truth to the people in forms of expression that are, perhaps, faulty, than the man of academic training can embody in the most accurately expressed phrasing of the schools.

Mr. Macdonald claims that the activity of the Labour Party has brought about the more frequent reference which we now have in politics to the moral responsibility of the community, for, however the Labour Party appeal may be framed, its aim is to reach the elementary moral sentiments of the people. Its descriptions of fact may be crude and biassed, but its final appeal is, "ought this to be." There is not a crusade for temperance, for clean living, for national and racial righteousness, for spiritual idealism but has had the support of the Labour Party.

The Labour leader strongly condemns those of the intellectual class who write about the Labour Party. In their writings.

"I have invariably found a recklessness of statement and accusation against workmen, their ways, and their motives, or a patronising air of superiority of mind and conduct, which is nothing but a manifestation of a class-feeling from which the writers innocently believe they are free."

Mr. Macdonald claims that the labour men :

....."are superior, both in their mind and their practice, to the preaching abstraction of a man whom Professor Jones has in his mind as the model Labour leader." He then enters into a lengthy examination of the position of the Labour Party with reference to Professor Jones's accusation that it is "corrupt in its very conception," and maintains that the Party has never made a class appeal, and has protected itself against champions who offered to serve it, when it suited them and be independent of it when they thought well. It began with a constitution, and its constitution had at first to secure a good stable nucleus for whatever additions had to be made afterwards. It was not a combination of one class, but of experience and thought, of criticism and construction. The general tone and temporary of the Labour Party in regard to the great social and political problems of the times are more or less determined by the fact that "the Labour movement lives in its ideal city. . . . But it is sojourning amidst injustice, amidst ill, amidst ugliness. . . . It therefore has wrath as well as aspiration."

The Whites and Non-Christian Races.

THE Right Hon. James Bryce contributes to *The International Review of Missions* an instructive article on 'the Impressions of a Traveller among non Christian Races.' Referring to the Spanish conquest of The New World and to the Spaniard's desire to 'save the soul of the heathen' he says that the primary object of the conquerors was to amass wealth. 'They did this with such ruthless cruelty that in some thirty years all the native Indians in Hispaniola (now Hayti and San Domingo) are said to have perished. The same thing happened before long in the rest of the Antilles.' 'Down to our time the same thing has gone on though with far less violence and cruelty than that which marked the doings of the 16th century.' He says:—

"Everywhere the native has suffered: everywhere the white adventurer or trader has attempted to treat him as if he had no rights or has regarded him as a mere instrument by the use of which he can profit. To some extent it is inevitable that the weaker race should suffer by this contact but there has also been much wilful and needless wrong doing on the part of the white men who have gone among the aborigines... Within the last few years there have been shocking and horrible things done in some parts of Africa by some so-called civilized Governments."

According to Mr. Bryce, while the British Government in India and the Government of the United States in the Philippine Islands should keep strong drink from their subjects, the private white men living in these countries often 'disgrace' the Christian name by their doings. "Their conduct constantly hinders or retards the good work which the strongest and the most enlightened Governments desire to do, as well as that of missionaries. The work of bearing the white man's burden too often takes the form of filling the white man's pocket."

The Revival of Islam.

THE *Muslim Review* for January contains notable article on the "Revival of Islam" from which we take the following:—Persia has shown the way. It was starting signal. Other Islamic countries quickly responded. The Turkish nation found a stumbling block in Sultan Abdul Hamid. He was the head of the Muhammadan confederacy. He was their spiritual pope. But religion would not tolerate sloth and neglect. Being the representatives of an energetic race, they would no longer tolerate inertia. Abdul Hamid was de-throned, and in his stead Mahomed, his brother an advocate of true principles and precepts of Islam, was installed.

Amir Habib ullah from his State saw the march of events. He could not retard the growth. Before any agitation cropped up, he took the initiative. He introduced a system of education in his country and modified his despotism to suit the temperament of that warlike race.

Muslim India was not an exception. The basis of intellectual operation of the whole Islamic federation lies in the spirited, enthusiastic and sturdy eighty millions of Indian Muhammadans. Standing on the bed-rock of a historic past and inspired by the names of great rulers and administrators who ruled India for more than ten centuries, the young Indian Muslim viewed the triumphal march of his brethren with pride. There are millions of educated Muhammadans who feel and think; and the organisation known as the All India Muslim League is a striking testimony of the revolution in the thoughts and ideals of modern Islam.

It is not of this individual growth and development I speak of, but I refer to another development which has recently grown. Recent events have turned the current of Asiatic history. What could not have been achieved in ages has been accomplished in a moment.

QUESTIONS OF IMPORTANCE.

Mortality amongst Educated Indians from Diabetes and other Diseases

The following circular has been sent to leading men in India by Rai Bahadur Lala Baij Nath, Retired Judge, Agra:—

The recent death of two of our important public men, the Hon'ble Mr. Krishnaswami Aiyar of Madras and the Hon'ble Rai Bahadur Lala Ramnunj Dyal of Meerut, from diabetes, in the midst of their career of public usefulness, has once more brought the question of the comparative longevity of our educated men to the front. As suggested by the *Times of India* any medical man of research who would investigate the causes whereby educated people die of diabetes, would have deserved well of the country. Cholera, plague, and fevers, seem to claim as many victims from amongst the educated classes as from the others. But the former are greater sufferers than the latter from complaints like dyspepsia, constipation, piles, diabetes, and other kidney diseases, lung troubles, and nervous disorders like paralysis and unless something is done to minimize the evil, we shall be daily losing our best men at periods of life when they are becoming useful to the country. I am, therefore, desirous of taking up the enquiry suggested by the *Times of India* should the leading medical practitioners in the country, both European and Indian, as well as our men of light and leading help me with their views on the following questions, which I submit for public consideration. The conditions of no two parts of India are the same, and it is necessary to get the opinions of the best informed men from every part of the country. It would also be well if those who are suffering from diabetes and the other diseases mentioned above, were to give us the result of their experience and point out the causes by which these troubles were originally brought about, and what

tends to increase or mitigate them. The questions submitted are merely tentative and such as a layman can think of. Should any others suggest themselves to medical men and others they may favor me with their views upon them also. Should we receive sufficient data to go upon I shall publish the result in a popular form free from professional technicalities for public use in consultation with some of our medical friends like Surgeon Major B. D. Basu, I. M. S., Retired, Allahabad, who has already given much attention to the treatment of diabetes by suitable diet:—

(1) What are the most prevalent disease amongst our men of education from which others not so highly educated are comparatively free?

(2) Is their power of resisting disease as good as that of the others?

(3) Are complaints like diabetes, lung troubles and paralysis common amongst the educated classes of your part of the country?

(4) Do these diseases claim more victims from amongst the educated than from the others, and generally at what periods of life and which of them claims the most?

(5) What conditions of life tend to favor these diseases and what the contrary?

(6) Are any particular classes of food and drink or particular preparations thereof responsible for these complaints?

(7) How far has the system of early marriages and the consequent loss of vitality to do with it?

(8) How far has life at School and College to do with these troubles?

The matter is of vital importance as affecting our well-being as a nation and I hope all classes of our medical men whether practising after the European or the Indian system, as well as all our leading newspapers and public men will give the matter due consideration and will kindly help the enquiry.

UTTERANCES OF THE DAY.

Lord Hardinge on "The Dacca University"

[A Deputation headed by Dr. Rash Behari Ghosh waited on H. E. the Viceroy, on Friday, February 6th. There were altogether ten gentlemen representing the various provinces in Bengal and Eastern Bengal, among whom were Mr Surendranath Banerjee, Bhupendra Nath Bose and Raja Peary Mohan Mukerjee.]

In the course of his Address, Dr. Ghosh said that the proposal to establish a new University at Dacca had been received with alarm and considered to be in the nature of an internal partition. The appointment of a Special Officer in charge of Education in Eastern Bengal with the likely creation of a separate education cadre would widen the division. Dr. Ghosh further said that the members of the Deputation were in full sympathy with every effort that might be made for the spread of education among the Mahomedan community in Bengal. Dr. Ghosh said that the greatest and most keenly felt objection would be the division that the new University at Dacca would introduce into the corporate life of the community. He prayed that the Viceroy might reconsider the matter or, at any rate, not arrive at a definite decision until H. F. Lord Carmichael, on whom would devolve the task of working the University at Dacca, had had an opportunity of examining for himself the question in all its bearings.]

His Excellency in reply said.—

Gentlemen,—I have received with pleasure the references in your representation to the memorable announcements made by the King Emperor at Delhi, and I gladly accept your assurance of your earnest desire to foster and to perpetuate the happy state of things inaugurated by His Imperial Majesty. You rightly attribute to me a desire to promote harmony, and I am hopeful that the pro-

nouncement that I am to make will conduce to that end. You are anxious lest the constitution of a University at Dacca and the appointment of a Special Officer for Education in Eastern Bengal should be in the nature of an internal partition, and widen the division between the re-united Provinces. In regard to the statement that the University of Calcutta has become an unwieldy institution, you urge that the University of itself has never made any complaint on this score, that with the creation of separate Universities in Behar and Burma the congestion, if any, in the Calcutta University, will be relieved, that the surroundings of Calcutta are not so bad as some would imagine and that the large numbers who are examined by the Calcutta University are not very different from the members examined by the London University, that the remedy for such evils as may exist will be met not by the creation of a separate University, but by the establishment of Colleges in the mofussil, the extension of the residential system and the foundation of special institutions and facilities, where necessary, for the Muslim population in Eastern Bengal. I may say at once that no proposals which could possibly lead to the internal partition or division of Bengal would meet with any support from the Government of India. Any such measures would be opposed to the policy embodied in the announcement of His Imperial Majesty to the views of the Government of India. The constitution of a University at Dacca, and the appointment of a Special Education Officer at Dacca rest solely on grounds of educational policy both general and local which are already appreciated by a considerable section of the public, and which I hope that you will appreciate after you have heard what the views and intentions of the Government of India are. I am proud to be the Chancellor of the Calcutta University. I appreciate highly the excellent work which that University has done in the past, and I am confident that it will continue

to maintain its high traditions, but I cannot believe that an examining University will satisfy any longer the needs of advancing India. Many thoughtful educationists, including the Vice-Chancellor of the Calcutta University, have drawn attention to the need of University Teaching, and to the development of the Association of teaching and Residential Universities. The movement for the establishment of Universities at Aligarh and Benares rests upon the widespread demand for a residential teaching system. Before the arrangements announced by His Imperial Majesty were considered, the Government of India who, I need not tell you, take the greatest interest in the advance of education in India, had included in their educational programme the constitution of teaching and residential Universities including a University at Dacca. They were and are convinced that the more such Universities are multiplied and distributed over India, the better it will be for the cause of Indian education and for the development of the moral character, no less than of the intellectual ability of the students. The Calcutta University which controls 52 Colleges with 13,375 students has a jurisdiction extending over the Bengals, Assam, Behar, Orissa, Chota Nagpur and Burma, examines some 9,000 candidates for Matriculation alone and is responsible for the Higher education of a population of more than a hundred millions. In the United Kingdom of Great Britain and Ireland there are no less than 17 Universities for the needs of a population of 45 millions, one University for about every 2½ millions. I do not wish to attach too much importance to a mere numerical comparison between the Universities in England and in India, but even allowing the variety of conditions the difference of figures is remarkable. The Oxford, Cambridge and Edinburgh University each possess a total of between 3,000 and 4,000 students. The Glasgow University has between 2,000 to 3,000, Manchester 1,550, the University of Wales 1700,

and other English Universities appear to have less than 1,000. The inadequacy of the then existing system to meet the local circumstances and the severe strain imposed by the increasing numbers upon the Calcutta University were urged so long ago as 1886, as reasons for the establishment of a University at Allahabad. The argument of numbers is far stronger to-day. Can it seriously be contended that it is compatible with educational progress to face the steadily increasing burdens on the Calcutta University in a spirit of inaction. How can the huge numbers continue to be examined satisfactorily, and how can the distant Colleges continue to be adequately inspected. Are we to be content for ever to have one University for the re-united Province in the teeth or experience in other countries? I cannot believe it. The most noteworthy fact in the recent history of the English University development is the gradual abandonment of the Federal University which examines but does not teach. The London University was itself re-organised in 1898, and a Royal Commission is now sitting to consider its further re-organisation. I cannot understand how anybody can pretend that the constitution of one or even two or more Universities in a single Province can possibly lead to an internal partition or division any more than the existence of Universities in most of the large towns of Europe or the contemplated Hindu and Mahomedan Universities which many of you support lead to partition or division. There is no compulsion upon parents to send their children to any particular College in any particular jurisdiction. The relations between the neighbouring Universities are clearly susceptible of administrative adjustment. I share the views of those thoughtful Indian gentlemen who see in the creation of the new Universities the greatest of boons which the Government can give India, namely, the diffusion of Higher education. It is a striking compliment to the intelligence and

educational progress of Bengal that the Government of India should have proposed to create in Bengal the first Teaching and Residential University of its kind in India, and the Government of India are confident that after mature reflection *their proposal will be regarded in this light, and as a distinct advantage on the present education system.* During the five years preceding the constitution of the Allahabad University the number of students increased by 37 per cent. In the five years following that event it increased by 17 per cent. in the territories within its jurisdiction.

I must assume that you are not less interested than the Government of India in improving the surroundings of student life in Calcutta. In regard to this matter I speak with some personal knowledge, and I do not speak alone. I need not quote in extenso the well known account of the life led by the students in Calcutta, which was published by Dr. Garfield Williams, and never has been seriously challenged. I will take one passage only. "There is practically no University social life" says Dr. Garfield Williams. "Most Colleges have a few ill-attended Societies exercising quite a minimum of influence." The Calcutta University Institute appeals obviously only to the very few. Believe me, you cannot exaggerate the significance of the absence of this social side in a University. The place where the students live huddled together, says Dr. Indu Madhub Mullick, who has special professional experience among Indian students, "are most hurtful to their constitutions. The houses are dirty, dingy, ill-ventilated and crowded. They are often most objectionable. In a case of sickness of an infectious nature, such as smallpox, chickenpox, measles, cholera, and typhoid, they have no place in which to be segregated, but lie in the same place as others, some of whom they actually infect and, etc." I will quote an even higher authority, that of the Vice-

Chancellor himself. These are the words of Sir Asutosh Mukherjee in his last Address to the Convocation "That the situation is fraught with the gravest danger cannot be questioned for a moment. The residences now provided *are in many instances so unsatisfactory that the arrangements for superintendence of so rudimentary a character, and the lack of intimate association between teachers and students so generally the rule, that the present system, if continued, cannot reasonably be expected to foster the conception of true academic life among our students.* The surroundings in which many of our students live and the obvious danger to which they are so often exposed are calculated in many cases to effect the complete ruin of the students not merely from the moral and physical but also the intellectual standpoint." My own observation, I am sorry to say, fully confirms the wider experience of these gentlemen, and I ask you, gentlemen, and I ask the parents of Bengal, are you satisfied that your sons should be brought up in such surroundings? Whatever your reply and there may be, mine is that I am not satisfied, and I resent the fact that many intelligent and refined young men should be brought up in such unhealthy and unequal surroundings. It is the solemn duty of the Government of India to spare no effort to remedy this state of affairs, and these are the reasons which have led the Government to think that experiments should be made upon new lines. On grounds of general policy, then, the Government have for some time been convinced of the necessity of creating new Universities in India and Universities of teaching and residential kind. There was a special reason for the announcement of their decision when I met certain Mahomedan gentlemen at Dacca. As you are aware, gentlemen, the Province of Eastern Bengal was before the partition very backward in education. Since 1906 it has made great strides forward. In that year there were 1,698 Collegiate students in Eastern Bengal

Bishop Whitehead's Sermon at Delhi

The following is the full text of the Sermon preached by the Bishop of Madras before the King Emperor at Delhi :—

Our service this morning forms part of a great historic event unique in the history of the British Empire, and it is more impressive because it is being offered not only by this congregation but by many thousands of our brethren and Europeans throughout India. The prayers which we have used are being said this morning in cities and villages, in cathedrals and mud prayer houses, in twenty different languages, and this union in prayer on this historic occasion expresses our deep sense of the spiritual and religious truths which lie behind the Coronation Durbar.

We believe that all power comes from God. The splendour of the scenes amid which our Emperor is crowned emphasises the truth that he reigns as God's representative. Behind all the magnificence of this Durbar stands the supreme sovereignty of God. And as we worship this morning before God's Throne, the whole significance of the Coronation of our King lies in our profound belief that he is truly called by God to his high office, that he has received from the hand of God the Crown of the British Empire, and that he is anointed by the Holy Spirit of God to give him wisdom and strength for his great work. I speak only as a representative of the Christian community in India, but our non-Christian fellow-subjects believe no less firmly than we do in the divine authority of their Sovereign, and the enthusiastic loyalty felt by the whole people of India towards their Emperor is due in no small degree to their belief that he rules over them as the representative of God.

This service too brings home to us the vast responsibility of Empire. As all power comes from God, so it is given us to fulfil the purpose

of God. The history of the world is the gradual fulfilment, even through the working of human passions and ambitions, of God's eternal will. Whatever is out of harmony with that will, comes to naught; whatever opposes it, is swept away. The kingdom of the world must at last become the kingdom of our Lord and of His Christ, that kingdom where the fatherhood of God and the brotherhood of man reign supreme. It may seem now a goal that is very far off, but whether far or near, it is the final goal towards which God is guiding all created life. And the permanent value of any empire or any social institution must depend upon its power of bringing nearer the kingdom of God, by making real and effective in the world the ideal of brotherhood. Here then lies the work of our Empire in the coming years.

And let us not forget that the achievement of this great end does not lie merely with statesmen and politicians, but far more with ordinary people in the ordinary routine of daily life. What is needed above all things is the sweeping away of the narrow traditions and un-Christian feelings that make brotherhood impossible, and a sincere effort on the part of individual men and women to look fairly at the facts of life in the spirit of Christ and to apply to their relations with all classes and all races the principle of brotherhood. We need to keep steadily before us the very highest ideal that the gospel of Jesus Christ can give us. We must not be content with lower standards. The Englishman in India stands for efficiency, for duty, for justice; let him also stand still more definitely for brotherhood and love.

Nothing less than the love and self-sacrifice of Christ will avail for the great work of Empire which God has entrusted to us to-day. There are high barriers and deep gulfs that separate race from race and class from class in our Empire and in the world. The one power that can enable us to bridge the gulfs and break down the barriers is the love of God and the power of the living Christ in our hearts and lives. God grant that this power may be ours.

THE NEW MAHARAJA OF NABHA.

Industrial Baroda.

CHANGES BETWEEN 1901-1911.

The old native industries have ceased to be profitable and no new industries have taken their place. Trade which was formerly centred in towns is now shared to a large extent by the villages also. Thirty years ago there were no shops to be seen in villages and the villagers had to go to the nearest town for the purchase of such articles as cloth, sugar, salt, etc. Now, all the larger villages have their own shops which supply the local wants. The opening of new railways or the extension of old ones has also ruined the trade of some towns. When a place was unconnected with railway, goods for its market were obtained from Bombay, Ahmedabad or Surat through agents in the nearest town with a railway station. The agents not only ordered out but also received the goods, and forwarded them in carts to the indenters. When such a place itself becomes a railway station, goods are obtained direct, instead of through the agency and the trade of the old railway towns thus suffers. For this among other reasons, the town population in the State is in some places stationary and in others decadent. Most of the towns in all the districts have made no progress in population since 1872.

AGRICULTURE AND FACTORIES

Apart from the bad seasons and plague, the past decade was one of great progress. The State railways which in 1901 had an aggregate length of 184 miles, have in 1911 grown to 446 miles or more than double in length. In 1901-02, the cultivated area in the State amounted to 5,815,095 bighas. In 1910-11, it was 6,074,321 bighas, an increase of 259,226 bighas or 4.5 per cent. The additional area brought under cultivation consisted mainly of fertile lands relinquished during the famine period. In 1901, there was only

one spinning and weaving mill in the city of Baroda, and 44 ginning factories and presses in different parts of the State. In 1911, the number of spinning and weaving mills have increased to 4, that of ginning factories and presses to 83, and seven dyeing mills, five oil factories, and 42 factories of a miscellaneous nature have sprung up. Joint stock companies have risen in number from 6 in 1901 to 39, and their capital has increased from Rs. 88,250 to Rs. 66,13,500.

EDUCATION.

Of the total population of the Baroda State, only ten persons out of a hundred are literate in the limited sense, in which this term was used at the Census. Taking the sexes separately, one male in every six can read and write and one female in every 50. Of the total number of literate males, 68 per cent. are over twenty years of age, and four per cent. under ten. Baroda is the only State in the whole of India in which Primary education is both compulsory and free.

Late Sir P. N. Krishnamurthi, K. C. S. I.

The following Government notification has been issued by the Mysore Government:—Whereas Sir P. N. Krishnamurthi, K. C. S. I., Jahgirdar of Yelundur, departed this life on the 10th December, 1911, and whereas Mr. Narasinga Rao Purnayya has applied to Government to be declared as the Jahgirdar of Yelundur, in succession to Sir P. N. Krishnamurthi, deceased, under the provisions of the Yelundur Jahgir Regulation I of 1885, notice is hereby given that the said application will be taken into consideration on or after 26th February 1912. Any representation from persons interested in the matter of the succession to the said Jahgir made before that date in writing to the Secretary to Government, General and Revenue Departments, will also be considered by Government.

The Tata Works.

The vast undertaking known as the Tata Hydro-Electric Power Supply Ltd, is rapidly going ahead. Construction is being pushed forward, and there are about 10,000 workmen engaged at present. The whole scheme will cost about £ 120,000. The *Advocate of India* representative had an interview with Mr Alfred Dickinson, Consulting Engineer in charge, in which he said — "This is a scheme authorised by the license granted by the Bombay Government in 1907. It is known as the Bulk Supply Scheme, the object being not to supply electric energy in small quantities for purposes of house and other lighting, but to supply energy in large quantities for power and such like purposes, such as driving of cotton mills and other works, and for supply of energy to railways and tramways. There are several methods of electric energy by steam engines, gas engines and oil engines, but the power in this one will be generated by water. To enable this to be done, large reservoirs are being constructed by erecting dams in Lanouli and Walvon valleys. From these reservoirs water will be conveyed in open duct to Khandalla. From here it will be conveyed in steel pipes to the Power Station, situated at Kampoli. In the distance between Kampoli and Khandalla there is a fall of 1,730 feet. At Kampoli will be established a large Generating Station, in which will be placed water turbines directly connected to electric alternators. From the Generating Station energy will be conveyed by overhead conductors to the Receiving Station in Bombay. It will be distributed to mills and other consumers by underground feeders in the same way as energy is now distributed by the existing Company. The power at present used by Cotton Mills alone in Bombay far exceeds the power at present being installed at the Generating Station.

The Sugar Industry.

CONFERENCE AT LUCKNOW.

At a Conference of those interested in the sugar industry at Lucknow, Rajho Prasad Narain Singh, Rai Bahadur of Baraon Estate, Allahabad, submitted a note on "Improvement in the Sugar Industry"

Allusion was made to the presence of Mr. Hulme, the newly appointed sugar expert, and pleasure was expressed at the interest that was being taken officially in the advancement of the industry, and in conclusion the following suggestions were put forward :—

(1) To popularise on a yet more extensive scale with Government help the above described Hadji's system of sugar industry amongst the people.

(2) To encourage shy cultivators and semindars to co-operate and to assist the Government in their efforts.

(3) To establish *rab* boiling miniature plants of that process in every three or four or more villages and *say* in a mile's circumference or radius with a central centrifugal factory.

(4) To lend the plants to cultivators.

(5) To appoint more Inspectors or Assistant Inspectors to supervise and initiate the people in the method sympathetically for the first few years.

(6) To give the cultivators Government *taccavi* for sowing extra sugar cane areas, in addition to what they might sow each year for themselves for making *gur*. To utilise *opium* advances in this case also.

(7) To limit and confine the *taccavi* for cane crops to be used in *rab*-making only and not in *gur*.

(8) To start central factories under this process with power establishment, and to experiment in some of them whether the vacuum pan system could be added to it with any benefit and then after some years' trials and sustained results to

add this on to the system where central factories are concerned, to allow the rural factories to remain as simple as possible without any vacuum adjuncts added to them.

(9) To promote irrigational means for cane areas.

(10) To introduce better qualities of cane species only after sustained trials at district headquarters and farms according to the nature of the soils in different districts or different parts in one and the same district.

Industries in the United Provinces.

A recommendation was put forward at the Naini Tal Industrial Conference in 1907, to the effect that the Cawnpore Technological Institute should be placed in a position to provide instruction in chemistry applied to the following industries, viz., (1) Sugar. (2) Leather. (3) Alkalies. (4) Bleaching, dyeing, printing and (5) paper-making. In this connection the Local Government, in November last, invited the opinion of the Upper India Chamber of Commerce as to the class of manufactures in which it is essential that the chemist appointed for the above purpose should have had practical experience. The Chamber thought it would be quite impossible to find a chemist who was an expert in the technology of such widely different subjects as those mentioned above. They considered that the man at the head of an institution of this kind should have a good knowledge of chemistry as applied to manufacturing processes generally, also of machinery and mechanical contrivances, and that he should possess sufficient commercial knowledge to enable him to work out the cost of processes and to determine their commercial possibilities. The assistant chemists, it was suggested, should each have a thoroughly practical knowledge of one of the different industries in which the institute is to give instruction. With regard to the salaries

which it was proposed should be attached to those appointments, the Chamber deprecated the sweeping reductions made on the original scheme, and considered the reduced salaries to be quite inadequate to tempt men having the required qualifications.

Indian Cotton for Lancashire.

The following *Press communiqué* from the Government of India will be read with interest :—

At a meeting of the Council of the British Cotton Growing Association, held on the 5th December, 1911, attention was drawn to certain Indian cottons which had been shipped to Liverpool during the year and which had been grown from seed in the Tinnevely district. A gentleman representing an important group of spinning mills reported that the cotton was very suitable for a considerable class of goods produced in Lancashire and that Lancashire could use 500,000 bales of this cotton per annum. The cotton in question is the variety known as Cambodia cotton of which description is given in the *Indian Agricultural Journal* for October last, and the congratulations of the Council of the Association have been conveyed to the local authorities in Madras for their success in producing so satisfactory a class of produce. The good opinion entertained in Lancashire of this kind of cotton has also been communicated to all Local Governments with a view to such action as is possible being taken towards its cultivation in areas suitable for it.

Oil from Grass.

A large industry in pressing oil from lemon grass is now being carried on in the Walwanad Taluk, South Malabar, by some native capitalists who shipped recently oil valued at over Rs. 10,000 to foreign countries where the oil, it is said, finds a ready market. The lemon grass is in abundance in the Walwanad Taluk, during all seasons of the year.

Indian Hosiery.

In case our cotton spinning and weaving mills are in want of something to do, they might offer an explanation as to how they have allowed cotton mills in Japan to walk off with the bulk of the cheap Indian hosiery trade, and they might add a line or two as to how the Japanese weavers are able to hold the Indian field in face of the fact that they have to pay shipping charges and customs duty before they are able to bring their goods into competition with those of Indian mills.

* * * *

The situation has all the appearance of being an extraordinary one. It is only within the last few years that the Japanese have attempted to storm the Indian market in the hosiery line but they have done their work so well that during 1910 they sent to this country hosiery to the value of £900,000, and it is fully expected that the value of these imports in 1911 will far exceed the figures for the previous years. It certainly does not at first blush look very creditable that our Indian cotton mills should be defeated to this extent on their own ground, but there is something in the fact that the Japanese lay themselves out for much finer spinnings than find favour here. But that is a defect that could be remedied, and is hardly an excuse for the Japanese success on our own commercial battlefields in the matter of cheap singlets, which seem to be gaining favour with wonderful rapidity amongst the natives. If our mills are really incapable of meeting this already large and growing demand, it would be interesting to have the exact reason clearly stated. We are aware that a question on this subject was asked in the Viceroy's Council some time ago, but elicited nothing wonderful. This Japanese hosiery import business has about quadrupled since then.

AGRICULTURAL SECTION.

Chemistry and Agriculture.

In the course of an article on "Technical Education" *versus* Practical Training, the *Pioneer* writes as follows on the importance of a knowledge of applied Chemistry to the progress of agriculture —

In two great departments of industry, technical education has been attended with extraordinary results, namely, agriculture and chemistry; in fact, one might say that the application of chemistry to agriculture has doubled the fertility of the soil in those countries in which it has been practised. The first experimental agricultural station in Europe was founded by Sir John Lawes at Rothamstead in 1840, and it was not until 1851 that Germany opened a similar station at Moecklen near Leipzig. Since then, Germany has gone ahead and has opened station after station, and there is now a very large number of such experimental farms throughout the country, where, by constant research and investigation scientific agriculture is advanced. As usual, England led the way with an isolated effort due to individual enterprise, the German Government has taken up the English idea, has exploited and applied our discoveries and has encouraged scientific agriculture by liberal grants. A very practical result of this action has been the creation of that wonderful industry "the manufacture of beet-root sugar." By the application of chemistry to the cultivation of beet-root, a crop has been raised which produces about £25,000,000 worth of sugar annually and which enables the cultivator to get ample supplies of fodder from the tops of the roots. This alone is a triumph for agricultural chemistry, but in other directions it has also done wonders for the staple crops of the

country. Had the Government of India devoted a tithe of their attention to the cultivation of indigo in the eighties, it is quite possible that natural indigo would still hold the field, and that the synthetic product of the German laboratories would never have been able to find a profitable market.

India, which is a purely agricultural country, offers a splendid field for the chemist and, although the rooted conservatism of the Indian peasant presents a troublesome obstacle to be overcome, it has generally been found that the best Indian cultivators are quite willing to adopt an improvement which increases the value of their crops and which is within their means to obtain. Unfortunately, the classes at our agricultural institutes are not attended by practical farmers, but by young men who are anxious to get appointments in the Revenue and Agricultural Departments of Government, men who have no intention of farming themselves, but are quite ready to show others how it ought to be done. It is doubtful if students of this type will prove of very great benefit to the agriculture of the country. The Indian peasant finds it difficult to learn by mere instruction, but he is always ready to imitate any good thing that he can see for himself and understand. It is remarkable how superior the village cultivation is in the neighbourhood of large indigo factories in Behar to that which is not so situated. The reason is that the villagers near the factories have watched the European planter's methods of cultivation year after year. They have seen his system of manuring, his deeper ploughing and the excellent results obtained, so in their humble way they imitate him and almost unconsciously raise the standard of their own agriculture. The lesson to be learnt is that the country needs not so much a body of itinerant instructors as practical demonstrations, to which the great

mass of cultivators will have ready access. To accomplish this end, a very large number of experimental farms must be established, where the actual effects of improved methods can be seen on the ground. In such places, really practical instruction can be given, the pupils will be genuine agriculturists and their only text-book will be Mother Earth herself.

The teaching of the experimental farm should be supplemented each year by an agricultural exhibition in every district, and the United Provinces owe a great debt to the present Lieutenant Governor for the splendid lead he has given in this respect. The educative effect of the Allahabad Exhibition was immense. It was visited by thousands of real cultivators and its lessons were carried to every village in the Provinces. No doubt, there was a mass of complicated machinery which was bewildering to the rustic, but at the same time there were many things which he could understand, and if the Exhibition sent a certain proportion of peasants to their homes, dissatisfied with their own primitive and extravagant methods, it did a great work. The annual agricultural fair of a district is a most useful institution. It can generally be made to coincide with some famous *mela* to which the country people resort in large numbers, and it serves as an index, which shows how far the teaching of the experimental farm has been effective, but the person who must never be forgotten in all experimental farms is the chemist. To the practical farmer he may seem a useless expense; but his value in the end is inestimable. The hosts of mediocre chemists in Germany have established the most flourishing industry in the country by utilising the inventions of the great chemical geniuses of England and France, who for want of an adequate rank-and-file could not themselves make sufficient use of their own inventions.

The Food of Indian Birds.

One of the most valuable of recent contributions to the "Memoirs of the Department of Agriculture in India" has just been issued in the form of a fairly bulky volume on the 'Food of Indian Birds'. The enquiry was carried out by Mr. O. W. Mason, lately Supernumerary Entomologist, Imperial Department of Agriculture, and its final object was to elicit definite facts regarding the influence, beneficial or otherwise, of birds as a whole, and of each common bird. Though apparently it has been limited to local observations round Pusa, the enquiry has been very exhaustive, and its results may be taken to apply generally to the whole of India, inasmuch as, in Mr. Mason's words, in all probability "foods of widely distributed species differ but little in different localities." It is, therefore, of great interest to learn from the brief summary of the enquiry which Mr. Maxwell-Lefroy contributes to the volume, that "in the main the birds common in Pusa are, from our point of view, beneficial," inasmuch as they assist the agriculturist by the destruction of harmful insects. Coming to details, there is a difference of opinion between Mr. Maxwell-Lefroy and Mr. Mason in regard to the crow. Mr. Maxwell-Lefroy would protect the crow, because it feeds on *Chrotogonus*, the very destructive grasshopper, though "sight of the specimens dealt with ate frogs." Mr. Mason, on the other hand, says that "crows cannot definitely be classed as beneficial, and require, if anything, to have their numbers kept within certain limits." But there is no doubt about the value of the King Crow, which is described as "a most important bird—far more so than the records seem to show," says Mr. Maxwell-Lefroy.

Protection of Indian Cattle.

At a recent meeting of the Committee of the British Association for the Protection of Indian Cattle—an influential body lately formed in London—the following aims and objects were framed:—

1. To prevent the unnecessary slaughter of cattle in India with the view of increasing the number and improving the breed of the animals employed for the cultivation of the land.

2. By this means to encourage the agricultural development of the country, and so render the United Kingdom less dependent upon foreign countries for her raw material.

3. To improve the general condition and promote the more humane treatment of cattle, in India.

Membership (which is free) is warmly invited and those interested in the welfare of this humane cause are requested to communicate to the President who will be most pleased to hear from them at the address below:—"K. S. Jassawalla, President-Founder, 45, Courthope Road, Hampstead, N. W., London."

Departmental Reviews and Notes.

LITERARY.

M. MAETERLINCK AND THE NOBEL PRIZE.

M. Maeterlinck, who received the Nobel prize for literature this year, intends to found a literary prize with the proceeds of his award. The Nobel prize amounts to £7,792, which M. Maeterlinck will increase so as to furnish at 4 per cent. an annual sum of £320 or £640 for two years. He wishes to found this prize for the best work written in French, whether of a literary, artistic or scientific order.

A NEW PAPER.

The long-felt desideratum of having an organ of voicing forth the feelings of the people in the land of the Rajputs is shortly to be removed as the advanced circle of citizens are contemplating to start an English weekly called *The Rajputana Echo* to give expression to public opinion. This shall be printed and published at Ajmere under the joint editorship of Mr. Fateh Chand Mehta, B. A., LL. B., (Cantab.) Bar-at-Law, Pandit Bansilal Sharma, M. A., LL. B., and Mr. S. A. Rashid, B. A., LL. B.

TIBETAN SCRIPTURES.

A copy of the Tibetan Scriptures has been purchased for the Adyar Library. These are printed on Tibetan-made paper from wooden blocks and the price of a set varies according to the weight of the paper, the heavier taking better impressions from the blocks and consequently fetching better prices.

CONGRESS OF ORIENTALISTS.

The Congress of Orientalists opens at Athens on April 4, but the usual *bulletine* as to programme, accommodation and the like have not yet been issued.

ERRORS OF THE EDUCATED.

R. W. N. writes to the *Bombay Gazette*:—A very common mistake even with good writers, is the substitution of "had" for "would," before the adverb "rather," "sooner," "better" and some others. "I had rather stay than go," instead of "I would rather." The origin of the error is evident enough. The two words "had" and "would" have the same contracted form when combined with a pronoun. "I'd rather" may be a contraction of either "I would rather" or "I had rather." This contracted form is generally used in common speech. Even when we are inclined to lengthen it we rarely give the full pronunciation. We say "I'd rather," leaving the verb doubtful to the listener's ear—and perhaps to ourselves. When driven to write it we feel naturally inclined to take the shortest word, without much regard to the strict grammatical meaning of the phrase. That the expressions "I had rather" is incorrect, will be made evident by simply converting "rather" into its synonym "more willingly." Yet, it must be admitted that this incorrect form is warranted by such high authorities from Shakespeare to some of the best writers of our own day, that it is entitled to be regarded, if not as an established idiom, at least as tolerated solecism. The confusion of "lay" with "lie" is among the most common error of speech, though well-educated persons are usually able to avoid it in writing. Every one who is familiar with the idiom of our language knows, or ought to know that "lay" is what is called a transitive verb and that "lie" is intransitive. We say "lay the book down." To say "lie the book," would be ridiculous. The error usually committed is in the opposite direction, the transitive verb being used in an intransitive sense. Many persons, not deficient in education, would say "Some of the children are laying on the grass." That the error prevails in the very highest circle of society and of scholarship cannot be doubted, when we find it allowed to mar the effect of one of the finest verses in Byron's well-known *Apostrophe to the Ocean*.

EDUCATIONAL.

LOCAL BODIES ON MR. GOKHALE'S BILL.

At a recent Meeting of the Viceroy's Council the Hon. Mr. Gokhale asked,—‘Will the Government be pleased to state what municipalities and district boards or councils in each presidency or province were invited to express an opinion on the Elementary Education Bill now before the Council, and how many of such bodies have expressed an opinion on the measure? Will the Government lay on the table copies of all opinions on the Bill received from local bodies by the various local Governments and Administrations?’

Mr. Syed Ali Imam replied —‘All communications which have been received on the Elementary Education Bill have been printed as papers relating to the bill and copies thereof have already been sent to all hon. members. A set of such of them as contain opinions or summaries of opinions of municipalities and district boards or councils is laid on the table. The information which the hon. member desires will be found so far as it can be obtained in those papers.’

RELIGIOUS AND MORAL INSTRUCTION

The Government of Madras have appointed a Committee consisting of the following gentlemen to consider and report upon the question of religious and moral instruction in schools:—

The Hon'ble Mr. J. H. Stone, *President*

The Hon'ble Mr. Justice P. R. Sundara Aiyar.

The Hon'ble Mr. T. V. Seshagiri Aiyar.

The Hon'ble Khan Bahadur Mahammad Habibullah Sahib Bahadur.

Diwan Bahadur P. Rajaratna Mudaliyar, C.I.E.
Rao Bahadur M. Rangachariyar, Professor of Sanskrit, Presidency College.

Rao Bahadur A. C. Pranatarthara Aiyar, Inspector of Schools, Fourth Circle.

Mr. T. R. Ramachandra Aiyar, High Court
Vakil,

Mr. M. Krishnamachariyar, Headmaster, Hindupur Secondary School.

Mr. A. Panchamakean Aiyar, Headmaster, P. S. High School, Mylapore.

The Rev. W. Meeston, Madras Christian College.

The Rev. J. S. M. Hooper, Principal, Wesleyan Mission High School, Triplicane.

The Rev. Father Bertram, St Joseph's College, Trichinopoly.

The Rev. H. Pakenham Walsh, Bishop Cotton Boys' School, Bangalore.

The Rev. Canon G. Herbert Smith, representing the Missionary Council on Aided Education.

Diwan Bahadur K. Krishnaswamy Rao, C.I.E., representing the Council of Native Education.

Mr. K. B. Ramanatha Aiyar, representing the Madras Teachers' Guild.

The report of the Committee should be submitted to Government through the Director of Public Instruction.

CO EDUCATION.

A report condemnatory of the system of mixed school education has been presented by the Headmaster of the Central London School District, and its abolition is recommended. He states that the worst characteristic of the training is its instability. The co-education system, it was expected, would infuse a spirit of emulation into the children, but not only had it not done so, but it had the opposite effect of making the girls disheartened and indifferent, and hampering the progress of the girls and boys alike.

THE DURGAM EDUCATION GRANT.

The *Pioneer* understands that of the Rs. 50 lakhs which the Government of India intended giving as an educational grant as supplementary to the ordinary Provincial expenditure Rs. 30 lakhs will be distributed for Primary education for boys, Rs. 5 lakhs for female education, Rs. 5 lakhs for Hostels, Rs. 2 lakhs for Technical education, and Rs. 3 lakhs to European schools. This will leave Rs. 5 lakhs reserve for the moment.

LEGAL.

THE RIGHTS OF A HINDU CONVERT.

Justice Abdur Rahim and Sundara Iyer, of the Madras High Court, delivered judgment on February 7th in a case involving large questions of importance as to the effects of conversion to Christianity of Hindu co-parceners. The parties in the present case were members of a Hindu family governed by Marumakatayam law, and the ultimate point that arose for decision in the case was as the effect of the conversion of two sisters who became converts under the names of Lydia and Saloma on their rights in property which descend to them and to a brother who, however, died before the sister. The contention urged on behalf of the appellants, who were some of the children of Lydia and Saloma, was that the two sisters were jointly interested in properties and that their rights devolved on their children and that the Marumakatayam law of joint holding with rights of mutual survivorship continued to govern the family notwithstanding conversion. On the other hand, the contention on behalf of the respondents was that the junior members of a Marumakatayam family were only entitled to maintenance and such rights ceased by act of conversion putting the converts outside the pale of the family and that Karnavan was only the owner of property belonging to a Marumakatayam Tarwad. Their lordships first disposed of this contention by holding that the position of manager of the family was very similar to that of manager of a Mitakshara family, though the former's position was pre-eminent in that there could be no partition enforced as against him, but the beneficial ownership of such a manager was no greater than that of the Manager of a Mitakshara family. Their lordships considered it as well established that all the members of

a Tarwad had joint rights of ownership in an estate. Coming then to the effect on that ownership and the conversion of Lydia and Saloma their lordships held that a joint Hindu family ceased to exist as such when conversion took place. The incident of survivorship was attached to Members of a joint Hindu family only as such, and it ceased to exist with the extinction of that family. Members could, if they had chosen, have entered into a new contract with mutual rights of survivorship but in this case there was no evidence on any contract. Their lordships then referred to *Abraham v. Abraham* (9 M. I. A. 184) and especially to passages where the Privy Council said that it was not a question of heirship, but co-parcenership as expressing rights and obligations growing out of status of an undivided family and as creatures of and subject to be governed by Hindu law and that the co-parcenership became dissolved by the conversion which by Hindu law put them out of caste. But as rights of converts were preserved by Statute, the result was that the converts became co-owners and tenants in common of joint property. This right of co-ownership descended to their respective children by the operation of the Indian Succession Act. Referring to 31 Bom. 25, where *Jenkins, C.J.*, differed from the decision in 10 Mad., their lordships pointed out that it was not the Indian Succession Act that destroyed the right of survivorship but the Hindu law itself which is not affected in this particular case either by that Act or by the Act removing converts' disabilities. Before the Succession Act, Hindu law might be applied to a convert as a rule of equity, justice and good conscience. If it appeared that a convert intended to be continued to be governed by that law, but after the Act, no amount of such intention would avail to evade the operation of the Act unless there be such a contract proved.

Their lordships then remanded the second appeal to the Court of First Instance for disposal in the light of observations in the High Court's judgment making all children of converts parties before the Court.

MEDICAL.

HAY FEVER IN CHILDREN

Although hay fever is essentially a disorder of early life, Hollopeter declares that fully three-fourths of all the cases occur before the fifteenth year, yet it is frequently mistaken for other affections, such as catarrhal fever, spasmodic croup, bronchitis, influenza, actual rhinitis, catarrhal conjunctivites, etc., hence the necessity for a careful consideration of all the symptoms, always bearing in mind the possibility of the disorder being hay fever.

The above mentioned writer seems convinced that hay fever is not usually recognized in young children:—

"It passes through the physician's care under many names in some form of catarrhal fever, coryza, autumnal or summer cold, many titles for slightly varied pathological conditions. If this is so, we are dealing with a disorder fully as prevalent as tuberculosis and though not fatal, equally distressing. Hay fever in children is milder and more varied as to time of occurrence, the habit period having not been established. This habit-period of disease is especially difficult to dislodge, as is well seen in the adult, but in the young it presents the most favorable conditions for treatment.

"Hay fever, therefore, is like diphtheria, a local expression of a systemic toxemia, and for its relief oft times calls for the making over the child, physically as well as mentally."—*Lancet Clinic.*

FRUIT CURES.

"A French medical journal contains an account of the various "fruit cures" which have been in vogue in the past or which are being practised at present. Of those the most important is the "grape cure," which has been raised to the dignity

of a treatment in several continental health resorts,—in the Tyrol, Bavaria, Montreux at Bingen and several other places on the Rhine, at Pallanza in Italy, at Odessa and Juba in Russia, and very widely in France. In France, it is the Chasselas grape that is most employed, and the patient is recommended to eat from one pound to six pounds daily, half the quantity in the morning, a quarter before lunch and the remainder before dinner. As a rule the patient goes into the vineyard and gathers the grapes which he eats on the spot. Analysis shows that the grape pulp, which alone is eaten, contains 10 to 20 per cent. of sugar, less than one per cent. of acids and minerals and over one per cent. of albuminoids, the rest being water. The course, as a rule, lasts for a month and is said to result in an increase of weight and appetite. Some patients prefer to drink the grape juice, and the raisin cure is another modification of the treatment. The strawberry cure may be said to date from the time of Linnaeus, who was cured of gout by this means in 1750. The strawberry has more water and less sugar than the grape, and the fact that it contains a minute amount of salicylic acid may help to account for the reputation it enjoys in the treatment of rheumatism. Lemon juice has long been made use of in certain affections, chiefly in those of a rheumatic nature. For the beneficial effects of lime juice it is only necessary to refer to the Board of Trade regulations."

IMPORTATION OF HYPODERMIC INJECTIONS.

A notification has been issued prohibiting from the 1st March the bringing by sea or land into Burma, by post, of hypodermic injections, and restricting the importation of these articles by other means to those by which they are imported by medical practitioners or licensed Pharmacists as defined by the Rules under the Opium Act.

SCIENCE.

THE SMELL FROM MOTOR CARS.

The obnoxious smell that is sometimes associated with motor cars is not always due to over-lubrication. In many cases the odour is due to oil or grease leaking from the gear-box and thrown by the shaft on to the hot exhaust pipe. At this point the pipe may not be hot enough to really burn the oil up immediately, but it does it gradually, and makes a most unpleasant smell in so doing. The remedy is a simple and obvious one. As a rule, the leakage, if round the bearing of the gear-box primary shaft, cannot be stopped, and the thing to do is to protect the exhaust pipe from the splashes. This can be done by fitting a thin iron shield an inch or two from the exhaust pipe and between it and the line of the oil splashes.

DENTISTRY.

School dentistry appears to have reached its highest development in Sweden, where the teeth of all pupils are under constant supervision. The dental surgeries of which there are about 30 are open each day, and at these special institutions, the school children are served for small fees—the plan of moderate charges having been found more satisfactory than free services. In Germany, with twelve times as many inhabitants, the complete dental surgeries for children are said to number about 100.

EYE COLOUR AND MENTAL TRAITS.

In reviewing in *Science*, the third edition of Punnett's little classics "Mendelism," W. L. Castle cites the following interesting passage:—

"A discussion of eye colour suggests reflections of another kind. It is difficult to believe that the markedly different states of pigmentation which occur in the same species are not associated

with deep seated chemical differences influencing the character and bent of the individual. May not these differences in pigmentation be coupled with and so become in some measure a guide to mental and temperamental characteristics? In the National Portrait Gallery in London, the pictures of celebrated men and women are largely grouped according to the vocations in which they have succeeded. The observant will probably have noticed that there is a tendency for a given type of eye colour to predominate in some of the larger groups. It is rare to find anything, but a blue among the soldiers and sailors, while among the actors, preachers and orators, the dark-eye is predominant, although for the population as a whole it is far scarcer than the light. The facts are suggestive, and it is not impossible that research may reveal an intimate connection between peculiarities of pigmentation and of mind.

THE WEIGHT OF VARIOUS BRAINS.

While the weight of the individual brain in each particular species, as compared with that of the entire system, may be said to have some bearing on the intelligence of the individual, there is no fixed proportion between the weight of the brain and the total weight of the body, as between one species and another, as is shown by the following table:—

		Average		
		Grammes.	Ounces.	Proportion. Per cent.
Elephant	...	4,660	164½	1-439 0-23
Whale	...	2,490	8978	1-25000 0-04
Man	...	1,400	49½	1-42 2-38
Horse	...	500	176	1-534 0-10
Gorilla	...	423	150	1-213 0-47
Orang Outang	...	400	141	1-134 0-75
Sheep	...	133	047	1-377 0-27
Dog	...	105	037	1-200 0-50
Pigeon	1-150 0-67

PERSONAL.

THE TOLSTOY OF THE EAST.

A representative of *The Daily News* had a conversation recently with Mr. Kellermacher, a well known architect of Johannesburg, who is at present in very close touch with Mr. M.K. Gandhi, the leader of the British Indians in the Transvaal against the Pass law.

Mr. Gandhi who so unselfishly suffered violence and imprisonment in the passive resistance movement on behalf of the right of British Indians, has also given up his little fortune of six or seven thousand pounds for social causes like that for which Tolstoy laboured. The hundred acre farm of Phoenix near Durban was some time ago handed over by him to the Trustees of the Colony, and this son and grandson of Indian Prime Ministers and eloquent and successful practitioners at the Indian Bar is at present penniless.

"He is," said Mr. Kellermacher, "an extremely modest man, as you know, a man of the highest courage, and he is the happiest man I have seen. He lives on a farm of eleven hundred acres near Johannesburg, which by coincidence belongs to me. Only about fifty acres are at present cultivated, the rest is virgin soil, and we have provided good supply of water through three bore-holes. General Smuts has promised to visit us, and in the next Parliament the law in resistance to which 2,500 people have followed Mr. Gandhi to prison will be abolished."

"And what is Mr. Gandhi doing on the farm?"

"He teaches a school of fifteen Indian pupils, and he is a shoemaker. He insists upon doing the hardest and the meanest work upon the land, and he does the work of ten men, sitting up all night with someone sick and beginning manual work as early on the morning as any one. There is no one in the world, I imagine, who carries out so vigorously the principles of

Tolstoy and you must remember that the Hindu temperament and belief do not tend so much in the direction of work as ours do.

"Mr. Gandhi believes that politics and religion are not activities apart from life, but must be put into active effect in every phase and detail of life. He teaches not by words but by deeds. Words can be misunderstood, but not deeds. Men who come in contact with Mr. Gandhi gain a new idea of the value of life and of human relationship. He is the one man who fought the cause of his countrymen in South Africa. He did it by throwing away all his privileges and insisting upon sharing the hardest blows that were going. He is doing just the same in the work of the farm.

"Tolstoyism," ventured our representative, "must be far more difficult in Africa where the colour prejudice is so strong."

"Colour prejudice," says M. Kellermacher, "is all rot. There is only misunderstanding with blacks when you are seeking to get everything out of them that you can. As soon as you take up the attitude that you must not exploit them the colour prejudice vanishes."

MR. FREDERIC HARRISON AND RELIGIOUS FAITH.

In his autobiographical memoirs just published Mr. Harrison regards the "growing disbelief in the family" as the most dangerous symptom of our age. With the following passage he concludes the book:—"I close this book with words that indeed resume themselves into all that I have ever written or spoken during half a century, which is this—that all our mighty achievements are being hampered and neutralised, all our difficulties being doubled and all our moral and social diseases are being aggravated by this supreme and dominant fact that we have suffered our religion to slide from us, and that in effect our age has no abiding faith in any religion at all. The urgent task of our time is to recover a religious faith as a basis of life, both personal and social. I feel that I have done this, in my own poor way, for myself and am closing my quite life in resignation, peace and hope."

POLITICAL.

FOREIGNERS IN CHINA.

A United States Consular report gives the following table, showing all nationalities having subjects resident in China :—

<i>Nationalities.</i>	<i>No. of Persons.</i>
American	.. 3,176
Austrian	.. 255
Belgian	.. 255
British	.. 10,140
Danish	.. 260

Non-Treaty Powers	.. 141
Total ..	<u>141,872</u>

ALL-BENGAL HINDU EDUCATIONAL CONFERENCE.

Dr. Rash Behari Ghose presided at a large gathering of the delegates of the All-Bengal Hindu Educational Conference held recently in Cornwallis Street, Calcutta, when a number of Resolutions were passed urging co-operation amongst all Hindu sects, and farther help from the Government in disseminating education, also the formation of Branch Societies in all sub-divisions to assist.

POLITICAL PRISONERS.

The London correspondent of the *Bengalee* understands that Mr. Keir Hardie will at once take up the question as to how many political prisoners, if any, have been released by calling for a return or otherwise.

MADRAS EXECUTIVE COUNCIL.

The King-Emperor has approved the appointment of the Hon. Mr. P. S. Sivaswami Iyer, C. I. E., as Ordinary Member of the Council of Fort St. George *vice* the Hon. Mr. V. Krishnaswamy Iyer, deceased.

BENGAL EXECUTIVE COUNCIL.

The Hon. Mr. Shams-ul-Huda has been offered and has accepted nomination to the appointment of Indian Member of the Executive Council of Bengal, when such appointment is created under the Act for carrying the administrative changes announced at Delhi into effect, and that the Maharaja of Durbhanga has been offered and has accepted the similar appointment on the Executive Council of the new Provinces of Behar, Chota Nagpur, and Orissa.

CHINESE PATRIOTISM.

Dr. Sun-Yat-Sen has resigned his office in favour of Yuan Shi-Kai who has now been elected President of the Chinese Republic. This self abnegation on the part of Dr. Sun-Yat-Sen speaks volumes in favour of Chinese patriotism. We in India who cannot forget our precious selves even in a good cause ought to learn a much-needed lesson.

EXECUTIVE AND JUDICIAL FUNCTIONS.

The Hon. Mr. S. P. Sinha, who has given notice of a resolution advocating the separation of the executive from the judicial functions, has been requested to withdraw his motion for the time being as the matter is still under discussion between the Government of India and the Secretary of State. Mr. Sinha has accordingly *done so*.

GENERAL.

CENSUS AND THE BRAHMOS

The number of Brahmoe in India according to the census of 1911 is 5,504 as against 4,050 in 1901. Of this number 2,939 are males and 2,565 are females. The subjoined table shows the number of Brahmoe in different Provinces, States and Agencies.

PROVINCE,	PERSONS	MALES.	FEMALES.
Baluchistan	50	25	25
Bengal	2,608	1,361	1,247
Bombay (Presidency)	131	73	58
C. P. and Berar	30	17	13
E. B. & Assam	1,288	681	607
Madras	374	219	155
Punjab	688	386	302
U. P. of Agra & Oudh	41	24	17
Bombay	28	17	11
Sind	163	86	47
Agra	29	15	14
Oudh	12	9	3
States and Agencies	294	153	141
Baroda State	6	4	2
Bengal States	65	31	34
Bombay States	4	2	2
C. I. Agency	9	6	3
C. P. States	2	2	3
E. B. and Assam States	10	6	0
Hyderabad State	36	18	18
Kashmir State	1	—	—
Madras States	2	1	1
Mysore State	65	31	34
Punjab States	12	10	2
Rajputana Agency	82	42	40
Cochin State (included in Madras States)	2	1	1

COST OF A GENERAL ELECTION.

What the entire cost of a general election is can only be a matter of conjecture. The official expenditure, which is not precisely the same thing, is always not out in a return prepared from the particulars supplied to the Central authorities by the various returning officers. After the lapse of a year the details for the general election of December 1910 have just been issued. The Expenses of all the candidates, exclusive of returning officers' charges totalled £ 790,959. Of this sum £ 156,612 was for agents, £ 104,915 for clerks, etc., £ 335,159 for printing, stationery

etc., £33,445, for public meetings, £39,637 for committee rooms, £71,271 for miscellaneous matters and £49,929 for personal expenses. The returning officers' charges amounted to £190,009 and the average cost per vote was practically the same in each of the three combined nations—England and Wales, 3s 8d, Scotland, 3s 7d, Ireland, 3s 3d. Out of a population of over 44,000,000 the number of electors (not the number of persons entitled to vote, for we still have plural voting) was only 7,694,741. The number of votes recorded was about 2½ million less than the number of voters on the registers. Some of the abstainers were such "volentes volentes" as owing to the uncontested seats some electors who only possess one vote had no chance of exercising their privilege. But when every allowance is made the number of shirkers must have been considerable. Will the proportion of such be so high when women are added to the electorate?

SOCIAL REFORM AMONG SWEEPERS.

The sweepers of Jullunder have opened a Samaj named "Valmiki Samaj" which lays down that sweepers instead of calling themselves "Chohras" should call themselves "Mehtars", that they should not eat the flesh of dead animals and should burn their dead bodies instead of burying them. Chaudhri Gurdes Dass, the president of the Samaj, sometime ago applied to the municipal authorities that the names of those sweepers who possess property qualifications should be brought up on the municipal voter's list. The application has been granted by the Dy. Commr. On the occasion of the last Dassera the "Valmiki Samaj" opened a Valmiki refreshment room in honor of King Elward. Hindus and Mahomedans who treat them as untouchables are not to be admitted into it.

THE INDIAN REVIEW.

A MONTHLY PERIODICAL DEVOTED TO THE DISCUSSION OF ALL TOPICS OF INTEREST.

PUBLISHED ABOUT THE THIRD WEEK OF EVERY MONTH.

EDITED BY MR. G. A. NATESAN.

MARCH, 1912

No. 3.

THE INDIANS IN SOUTH AFRICA.

BY

MR. HENRY S. L. POLAK.

THE history of Indians in South Africa, from the day that the Imperial Government was induced to swallow, with its eyes fast shut and its mouth wide open, the fateful Transvaal Law 3 of 1895, to the present day, its attitude has been one of casting pledges to the winds, weak yielding to loud-voiced and unjust demands, and subordinating principle to the dictates of political expediency. Nor is there any reason to suppose that that attitude is likely to undergo any material change in the near future. As a Government, the Imperial authorities will incline rather to the Colonial than to the India Office. It is realised that it is safer, in dealing with such high spirited "Imperialists" as the British public, to kow-tow to Colonial prejudice, even if insult has to be heaped upon the people of India, and until Indians make up their minds that this state of things must cease, they may rest satisfied that it will continue indefinitely.

South Africa is now a single Union of Provinces, far more powerful for evil than ever before, when they were separate states, with often conflicting policies. All the old separate streams of envy, malice, chicanery and enmity are now

being diverted into one swift-flowing channel. Greater powers than have been granted to any other British dominion have been conferred upon the Union, without the exacting of any corresponding guarantee of good faith in regard to Imperial obligations. Self-government has been given, and is interpreted to mean, not only the right of misgovernment of those capable of self-defence by the abolition of an objectionable régime, but even of those of whose interests the Imperial Government is the self-constituted guardian, who have no voice in the control of the administration, who are a weak, hated, and despised minority. And this, too, is the interpretation that the Imperial authorities put upon their own functions—that they may not even legitimately offer a protest when any old-standing legislation, discriminating against Indians because of their race, is re-enacted. The South Africa Act provides that all racial matters must be left in the hands of the Union, and not the Provincial Government. The Provinces are constantly endeavouring to arm themselves with powers to be wielded against the Indian inhabitants; the Union Government does not greatly trouble about this, rejoicing rather at the opportunity of inflicting vicarious punishment; whilst the Imperial Government is being constantly, deliberately, and, in some cases, willingly blinded to the real tendencies of these attempts. The Act arms the Imperial Government with "the

power to refuse assent to unjust legislation. Does any sane person, with recent Colonial history before him, and after digesting the speeches delivered at the last Imperial Conference, indicative of the insolent contempt with which Imperial Ministers are regarded by Colonial Cabinets, really suppose for one moment that that Government would have the courage to refuse assent to any measure sent up by a substantial majority of the South African Parliament—a majority that is assured wherever Indian affairs are to the fore? Let not the Imperial authorities take umbrage to their souls for whatever improvement has fallen to the lot of the South African Indians. Had they not been goaded on to plead hesitantly for redress, by the deliberately assumed sufferings of those Indians, the growing indignation of the people of India, and the constant hammering of Lord Ampthill's Committee, they would never have lifted a finger. The Colonial Office has done nothing of good-will, but because it has been compelled, by outside pressure, to take action. The Colonial Office—that is the real rock of offence—and the Indian people ought to focus all their attention upon this fact. The Colonial Office, with the memory of the American War of Independence, represents the jingo spirit that rules the Empire to-day. It cannot be expected, in the circumstances, to speak to, but rather for, the Colonies, which probably accounts for the inability of the Government of India to accept Mr. Gokhale's recent resolution on indentured labour. And until the Colonial Office is made to realise the danger of betraying an Imperial trust, the situation is bound to get worse. Since Lord Crewe has gone to the India Office, his points of view appear to have changed greatly. Why was the change of office needed? The principles involved remain the same. The facts at issue are approximately the same. But the point of view has changed. The new point of view is that it is an Imperial danger of the

most tremendous significance for twelve millions of selfish, reckless, passionate, uncultured white colonists to conduct Imperial affairs in such a manner as to arouse the fierce resentment and fanatical hatred of the three hundred and fifty millions of the coloured subjects of the Crown. With its white—or so called white—population of a million and a quarter, South Africa may yet wreck a great and mighty Empire; and if it does, that Empire will have deserved destruction, for it will have been a party to it.

What is happening to day in South Africa? What is the present fate of the 150,000 Indians there? What are their prospects? Well, they are being robbed, maligned, demoralised, and ruined as fast as it is possible for these things to be done. The Transvaal Gold Law deprives them of the right of residence and trade outside of locations in mining areas. This implies a complete reversal of the Imperial Government's policy, announced in 1904, by Mr. Lyttelton, after the Supreme Court decision that the then existing law did not compel Indians to trade and reside in locations. The Imperial authorities were warned, in 1908, of the probable effects of this measure but they preferred to believe the diplomatic prevarications of the Transvaal Government, that no rights were being taken away. Yet, if and when the law is rigorously enforced, practically the entire Indian community will be segregated, and, in effect, expelled from the country, for rights which were previously personal and transmissible have become local and non-transmissible.

The Transvaal Townships Amendment Acts, apparently quite innocuous, have taken away the right of a European to hold fixed property in trust for an Indian virtual owner. Couched in general terms, they provided for the conversion of leasehold into freehold title, and conferred upon the Governor the power to settle the conditions upon which the Crown grants were to be made. One

of the conditions, not inserted in the law itself, is to the effect that the grantee is forbidden to permit coloured persons to reside on or occupy the property, except as domestic servants, on penalty of its confiscation without compensation. Mr. Amod Moosa Bhyat, one of the leading Indian traders of the Transvaal, last year brought a certain freehold property in the town of Boksburg, and had it registered in the name of Mr. Ritch. The facts were known to all, and Mr. Bhyat, commenced to trade on his own premises. But Boksburg is a "white" township, and the "white" inhabitants found Mr. Bhyat's dusky presence undesirable. They did not wish a brown man, and an Asiatic at that, to compete with them under any conditions, and they have induced the Government to serve a notice upon Mr. Ritch, requiring him to deliver up the title-deeds for confiscation, without compensation to Mr. Bhyat, who thus finds himself faced with costly legal proceedings, on the one hand, and ruin, on the other. Thus, the Imperial Government has now to realise that it has granted power to its subordinate administration to rob the thrifty Indians who have invested their savings in the country where these were made. And it should be understood that all this is being done, not directly under the provisions of a law that comes before Parliament for discussion, and before the Colonial Secretary for scrutiny, but by means of regulations that Parliament does not see and of which the Colonial Office is carefully left in entire ignorance.

The Indian residents of the Township of Vrededorp, a suburb of Johannesburg, were given notice to leave their homes and businesses there, on the 8th ulto, with merely nominal compensation. Readers of these columns will remember Lord Selborne's recent appeal, in the House of Lords, for sympathy with those who were fighting for the preservation of their racial welfare—the white community. It was Lord Selborne who, as

the *Rand Daily Mail* says, "freed" the township of Indians when the Colony was under Crown government. Says the paper:—

At the time the Vrededorp Stands Ordinance was under discussion in the Legislative Council the fear was expressed that the Imperial Government might decline to approve of such drastic legislation.

The then Governor of the Transvaal, Lord Selborne, however, came to the rescue, and, in a despatch to the Secretary of State for the Colonies, dated October 29, 1906, he said:—

"Under the law of the Transvaal no Asiatic can acquire title to land, and as, under the terms of the tenure granted in Vrededorp by the Government of the late Republic, the owner of the stand is required to occupy his property, the occupation of a stand by an Asiatic would clearly be a violation of these terms. The restriction, therefore, which is embodied in the present Ordinance merely perpetuates the legal conditions which were found in existence in Vrededorp when the country was annexed to the British dominions. But there are strong reasons for retaining this restriction on its own merits. The arrangement whereby a community of poor whites was placed in close juxtaposition with the Malay quarters and native locations was not in itself a happy one, but it would be much less so if these different elements of population were massed together. The practice of allowing Europeans, Asiatic and native families to live side by side in mixed communities is fraught with many evils, and is, I am satisfied, injurious to the social well-being of all the three. The policy of the Government, which aims at keeping the quarters in which the various races reside apart from one another, has my approval, and it is in pursuance of this policy that white persons are prohibited from residing in the bazaars assigned to Asiatics and in the native locations. It would have been impossible for the Government of the Transvaal to sustain this wholesome regulation, and at the same time to insist on throwing open for Asiatic occupation a township specially designed by the late Government as a workman's quarter for poor whites of Dutch nationality. The difficulty of such a course would have been all the greater seeing that the occupation by Asiatics of this quarter is not at present lawful, and that the whites themselves are not allowed to reside in the Malay and native quarters immediately adjacent. The poor whites resident in Vrededorp, who are for the most part Dutch, are strongly in favour of the provision maintaining this prohibition."

The fact of the matter was that *all permanent residences in Vrededorp was illegal*, but Lord Selborne, as a sop to the Boers, who were the "poor whites" resident there unlawfully, granted fixity of tenure to them at the expense of the Indians, who were dispossessed. The sum of £ 20,000 at least is at stake, besides the future of a number of families who, by reason of the Gold Law and Townships Acts, will have the greatest difficulty in finding a place, outside of a location, where they can earn an honest

The Draft Municipal Ordinance threatens respectable Indians with the loss of their occupation in many branches of industry, but its passage is delayed because it contains provisions in conflict with the safeguards of the South Africa Act.

Indian railway passengers are threatened with murder if they dare to avail themselves of the accommodation to which they are still, in law, entitled.

The Orange Free State has no modern Indian history; its shame lies in the past, but it is a shame that cannot be blotted out. The Cape Colony, which, of yore, was liberal and friendly, is gradually becoming tainted with the anti-Asiatic venom that is poisoning the springs of life for the Indians of South Africa.

Natal still taxes the chastity of its ex-indentured Indian women and the honesty and marital fidelity of the men, so that, to-day, only six labourers out of every hundred, at the expiry of their indentures, can afford the dubious privilege of freedom. The Licensing laws rob even the Colonial-born Indian of his right to earn his livelihood as a store keeper.

That is the present tale of woe. What of the future? The new Immigrants Restriction Bill is now before the Union Parliament. It ostensibly provides for the solution of the passive resistance difficulties. It repeals the offensive Registration Act of 1907 and apparently removes the racial bar from the statute-book, so far as immigration is concerned, though whether it really does this depends upon the interpretation given to the relevant clauses by the lawyers who are now being consulted by the Transvaal Indian community. The point at issue is a highly technical one, and is not suited to discussion here. But almost as important is the fact that, in spite of the declarations of the Imperial Government, that, in arriving at a settlement of the Transvaal trouble, it would not countenance any diminution of the rights of Indians resident in the other

Provinces, subtle attempts are made in the Bill to annul those rights. The right of appeal to the courts seems to have been largely taken away. The statutory definition of domicile, in Natal, protecting the resident Indians, disappears. The definition of domicile and the relation of wife to husband and father to son are left to the determination of arbitrary officials who, on the one hand, have it laid down for them by a judge of the Transvaal Supreme Court, that a Mahomedan Indian is entitled to bring any woman into the Province and call her his wife, to the exclusion of his first wife, married to him according to the law of the Province, as Transvaal law does not recognise the Mahomedan law of marriage; and, on the other, are convicted of contempt of court or are described by a Provincial Judge-President as being unwilling to be convinced by the best legal evidence that an Indian boy is the son of his father. The Bill contains a number of minor defects, but those enumerated will give some idea of its nature and intention.

It is easy to understand, however, that Lord Selborne, in raising the phantom of self preservation, has confused the real issue, which has never been whether or not there be unrestricted Indian immigration into South Africa, but the two fold one of the method of immigration restriction—whether on racial or cultural lines—and of the treatment to be accorded to the resident Indian population.

There is no doubt that a sustained attempt will be made to "freeze" Indians out of South Africa. That it will fail goes without saying. The South African Indians have already shown their mettle, and will no doubt continue to do so. It takes two to drive a bargain, and the Indians of South Africa have been no parties to this nefarious transaction. The future lies very dark indeed before them. But it is by no means a hopeless one. They will continue the struggle against injustice by every legitimate means in their

power. They refuse to admit defeat or to leave the country, which, of course, is the same thing. And they look to Ind'a to put forth the effort that will make the struggle against such heavy odds a less difficult one. Trouble that is shared is much easier to bear, and if the South African Indians can be assured that India's heart beats with theirs, they will be even prouder to take part in a fight for the national honour that will help to create the new India. Though no endeavour should be spared to prevent the impending calamity, if the worst happen, India will have no cause to be ashamed of the labours of her colonists in South Africa. *Gold is refined by fire, and the spirit of men by suffering.* But the best way to help is undoubtedly to convince the Imperial Government of the need to put a little backbone into the Colonial Office, so that at least an attempt may be made to redeem the errors of the past. India has much to forgive.

INDIAN RAILWAY FINANCE.

By MR. D. E. WACHA.

[The following is a Note which Mr. Wacha has recently appended to his brochure on "Indian Railway Finance" criticising the Report of the Indian Railway Committee in London presided over by Mr. J. Mackay, now Lord Inchcape. The criticism has been made, as Mr. Wacha says, from the purely Indian point of view, and the present note has been prompted by the debate which took place on 26th February 1912, in the Viceroyal Legislative Council at the instance of the Hon'ble Mr. J. K. Gokhale. We now leave Mr. Wacha to speak for himself. Ed. I. R.]

This criticism of Indian Railway Finance aims at presenting from the Indian point of view:—

Firstly, a general survey of the railway policy of the Government of India and, secondly, a criticism on the recommendations made in their report by the Indian Railway Committee appointed in March 1907, by Lord Morley, the then Secretary of State for India, to inquire and report, after calling witnesses,

(1) Whether the amounts allotted in recent years for railway construction and equip-

ment in India are sufficient for the needs of the country and for the development of its trade; and, if not, then

- (2) What additional amounts may properly and advantageously be raised for this purpose;
- (3) Within what limits of time, and by what methods they should be raised;
- (4) Towards what objects should they be applied; and
- (5) Whether the system under which the Railway Board now works is satisfactory, or is capable of improvement, and to make recommendations.

Sir John Mackay (now Lord Inchcape) was the Chairman of that Committee. It is not difficult to conjecture, therefore, the selection of the identical gentleman by the present Secretary of State on a recent secret and unofficial "mission," the aim and object of which are at present unrevealed.

But be the secret aim and object what they may, I cannot help thinking that the Hon'ble Mr. Gokhale has rendered useful and distinct service to the Indian public by raising the debate. It serves an useful purpose so far as it rivets the attention of the public not on the immediate subject alone but on the larger and more vital question of the policy of the Indian Government on railway matters, specially railway finance. It is a matter of profound regret that though sixty years have now elapsed since the date of the commencement of the construction of railways in this country, say since 1848, there has not been published hitherto a complete and accurate history of Indian Railway finance. But one important tell-tale or crucial fact of the net financial result of these different railways may be stated here. Of course, there have been paying railways as well as losing ones. There are some which are losing still as may be learned from the Annual Railway Administration Report. But the final result is, that taken as a whole, it is of a most dis-

appointing character. Up to 1910, there has been a net loss to the State, that is the tax payer, of fully 40 crores of Rupees! In other words, in the State ledger, there is a *debit* of that amount. It is this colossal amount which has yet to be wiped off. The taxpayer may consider himself fortunate if it could be wiped off in the year of grace 1925.

But from this one crucial fact of the net financial result of Indian railways, it will be admitted that there is eminent necessity of a complete narrative of railway finance which shall inform us as to what the gain or loss there has been from year to year with the *causes* which have led to it. The necessity is the more obvious when regard is had to the fact of the colossal capital outlay already incurred, namely, 439 crore rupees, and the burden of interest charge entailed on the annual revenues—revenues which on the one hand are threatened with considerable diminution by reason of the impending extinction, or next to extinction, of the opium receipts from the annual budget from 1914, and revenues, which on the other hand, are found to be admittedly inadequate to meet the growing expenditure on education, sanitation and other objects of utility to which the Government are already committed.

It cannot be denied that during the last few years there has been a larger capital outlay on railways owing to the programme of further construction, equipment and extension at a breathless pace, that is to say, at a greater pace than is warranted by the necessities of the country and by the ability of the State. None disputes the utility of extended railways. But that utility in any country must be strictly limited by its financial strength. Utility is one thing and financial ability is another. It is not possible for India, an admittedly backward and poor country, to imitate the example of so progressive and wealthy a country as England or the United States. India's need must be measured by India's financial

ability, that is, the ability of the taxpayer to bear the burden of heavy annual interest charge on capital borrowed for public works. A wise State, conscious of its financial condition, would pause and take breath before now and again entering on large enterprises demanding colossal borrowings. India is certainly one of those States which demands all the financial sagacity that her helmsmen may command. However great the need of new lines or extension of old, or of additional development and equipment, they must cut their coat according to their cloth. And even then, care has to be taken which utilities demand more urgent attention. The Government might well be asked whether a larger sum during the last 20 years might not have been more wisely and economically spent on Irrigation works. Again, there are persons who think that had even half the amount recently borrowed for railway purposes been spent on diminishing to a reasonable extent the illiteracy of the masses and the death rate of the country owing to terribly insanitary conditions, the people would have been infinitely better off than with these new railways the absolute utility or even urgency of which is open to serious challenge. Will it be denied that the Government have done very little in respect to irrigation, education and sanitation, compared with what it has done for railways? The people at large might have been infinitely better off agriculturally, socially and intellectually by reason of the larger sums which might have been wisely spent on those objects instead of on railways merely which only a microscopic minority of foreign but influential traders have uniformly clamoured and successfully agitated for. It must be ruefully acknowledged that the policy of the Indian Government in the matter of the welfare of the masses has been far from statesmanlike. A powerful and interested class, a minority, has been pampered to at the expense of the masses to whom less than proper justice has been

financial operations during the same decade. Gross earnings increased by 36·20 per cent. while gross working charges 60 per cent. Interest charge, again, which stood at 4·37 crore rupees in 1901 rose to 6·127 crores in 1910! Thus while the annual average in the first quinquennium came to 4·70 crore rupees, in the second it came to 5·75 as may be worked out from the table appended to the foot of this prefatory note. Is there not a sufficient case, I may inquire, for honourable members to raise a discussion on this question of railway finance at the meeting of the Council at the coming budget debate? It may also be useful to raise the question of the expediency of separating railway revenue account from the general revenue account. I need not say it would result in a better check and control over railway finance than it has ever been during the last 50 years and more. In the past, opium receipts, oftener than not, played the *dens ex machina* with the annual budget. Opium receipts have now a *days given place* to railway account. It is this account principally which spells a surplus or deficit in the annual budget. The time has come to lay low this divinity also. It all depends on the public spirit, the courage, and the competence of the honourable non-official members of the Viceregal Council how they tackle this subject. Let us hope the coming debate may witness the first serious campaign of non-official crusade against improvident and uncontrolled Railway Finance. The breathless progress of the Railway Rake demands a strong curb and effective control.

King George's Speeches on Indian Affairs.

PART I.—A complete collection of all the speeches made by His Majesty during his tour in India as Prince of Wales.

PART II.—Full text of all the speeches delivered by His Majesty during his Coronation Durbar Tour in India.

APPENDIX containing the Coronation Oaths and Proclamations of King George, King Edward and Queen Victoria.

WITH 8 PORTRAITS. PRICE RE. ONE.

To Subscribers of the "Indian Review," Rs. 12.

THE LATE MR. W. C. BONNERJEE.

[A portrait of the late Mr. W. C. Bonnerjee was presented recently to the Calcutta University by the representatives of his family. The portrait was executed by Mr. A. E. Harris.]

Metropolitan Architecture in Ancient India.

BY

MR. G. A. CHANDAVARKAR.

PRIMITIVE man would be instinctively prompted to provide himself with food and shelter and when necessity compelled him to seek protection from the elements, the idea of constructing a dwelling should have struck him. In course of time, these primitive dwellings came to be replaced by mightier structures. With the development of man's instinct for social organisation, these dwellings came to be constructed nearer and nearer one another, till at last villages sprang into existence. In the wars which one tribe waged against another, the physically strongest man became the military leader. Gradually when men began to realise the necessity of subordinating individual actions to the dictates of society in general and to the mandates of one man in particular, the idea of kingship was conceived and the choice naturally fell upon such military leaders. With the growth of political instinct, such kings whose power and origin were both considered to be superhuman began to live in particular places and occupy special buildings. The massiveness and the grandeur of these buildings ought to be commensurate with the dignity and sanctity attached to the person of that God's Vicegerent. Slowly but surely, the villages formed the nucleus around which cities grew and out of these primitive dwellings arose the palatial buildings. Hamlets grew into villages, villages into towns and towns into cities. The tent of a savage became a wigwam, a wigwam a house and the house when amplified became a palace.

Thus we see that though the history of architecture is coeval with the history of man, the history of building palaces and constructing roads marks an epoch-making period in the progress of

civilization. Large towns and royal roads are a necessary concomitant of civilization. Capital cities are only possible where men have made a considerable advance in civilization. In a well-known Sanskrit work called "*Sukra-niti*," Sukracharya has laid down certain plans and made valuable suggestions for the construction of capital cities and royal roads. In these fundamental principles enunciated by that author, we see the embryo plan which under different political and social conditions might have become the model plan for the whole of India. The twentieth century architect may find flaws—and what is there that has no flaws?—and detect no great architectural skill in those shlokas but he shall certainly admit that the shlokas are brimful of history and that they furnish us with a criterion by which we can judge what advancement in civilization the people had made even in those 'prehistoric times.'

The personal history of this author is shrouded in mystery but tradition and folklore describe him as the priest and preceptor of *Asuras*. Indeed, an element of truth lies in this tradition. In the historic development of the early Aryan race, *Asuras* and *Suras* occupy the position of the two opposite poles. While the *Suras* considered life on this earth a mere dream and an illusion, the *Asuras* thought that it was real and full of meaning. The character manifested by *Devatas* was of a meditative and a passive nature while the one revealed by *Daityas* was of an aggressive and militant type. *Asuras* dedicated their lives to the worship of matter while the *Suras* sacrificed their all in the service of spirit. These *Daityas* seem to have made a considerable advance in civilization, they knew the art of shipbuilding, they carried on naval warfare and they are also believed to have used aerial cars.

They founded great cities like *Lanka* and constructed formidable fortresses and naval ports like *Dwaraka*. The sphere of their influence,

far and wide. They founded colonies in Macedonia Scandinavia, Siberia, Turkistan and even in America. Assyria was, however, the stronghold of these Asuras*. It is but natural, therefore, to expect that the priest and preceptor of such a mighty race should compose a book wherein mention should be made of the plans of constructing capital cities: nor is the construction of cities the only subject with which this Niti deals. Treating as it does of a multitude of other subjects of varying degrees of importance and interest, it is cyclo-pædic in its nature.

The principles of ethics and statecraft enunciated therein are well calculated to exert a healthy influence on those for whom the Niti was primarily meant and to direct their vigorous energies in the proper channel. The Asuras, however, seem not to have digested the wise sayings of their preceptor and met with the inevitable fate, a disastrous downfall, so much so, that hardly is there any monument left by them to tell to future ages the

doleful story of their rapid rise and quicker down-fall. But Shukracharya has, by composing this book which serves the purpose of an index to mark their position in the scale of civilization, immortalised their names. The study of the growth of civic life is of supreme importance as it enables us to draw inferences about the growth of civilization in a society. Because without the evolution of a high civic life, no civilization is possible. The scientific study of the Sanskrit language, the wide researches made by antiquarians and the sound conclusions arrived at by oriental scholars have given unmistakable proofs of the greatness of Aryan civilization in almost all the branches of human knowledge. Mention has also frequently been made of 64 Kalas (arts) in Sanskrit works, and treatises. Dr. Rajendra Lal Mitra makes mention of the following eight Sanskrit books treating of architecture: (1) Manasara (2) Mayamata (3) Kasyapa (4) Vjaghana (5) Sakaladhikari (6) Viswakarmiya (7) Sanat Kumara (8) Sarasvatyam. But curiously enough, the Doctor who is himself the discoverer of this Niti has not included it in the eight works above mentioned on architecture. Probably because this book does not treat mainly of architecture. However, we do find some Shlokas in this Niti which treat of civic architecture and this short essay which has those for its basis is an humble attempt of the writer to substantiate the statement—if substantiation is still needed—that the ancient Aryans were a highly civilized race.

The following are the suggestions of the author.—

THE SITE FOR A CAPITAL CITY

213 and 214*. The capital city should be constructed

* The Nos. refer to the numbers of Shlokas in Chapter I of Sukra-niti edited by Jivananda Vidyaasagar Esq., B.A. of Calcutta.

* Next in antiquity to the civilization of the Nile valley was that of the Kingdom of Assyria. Excavations carried on at Nineveh, Mesopotamia and Khorsabad have revealed plans of great palaces of remarkable extent and magnificence. It is singularly interesting and highly instructive to note the derivations of some of the countries and the names of rivers beyond India and to find that many such names are purely of Sanskrit origin as is the case with the following few—

Sanskrit derivatives.	Meanings	Modern Names
Cula Deva	1. Family God The country colonised by Brahmins	1 Chaldea.
2 Sharmans	2 (Brahmins) Jermans.	2 Germans
3 Samudra	3 An Ocean	3 Sumatra
4. Nilal	4 Blue and dark waters	4 The Nile.
5. Tripura	5 Three cities	5 Tripoli.
6 Auras	6. Descendants of Awa.	6 Iranians.
7. Turishka	7 Warrior chiefs	7. Turkistan.
8 Scandana Nahi	8 Name of a city in Maghada.	8 Scandinavians.
9 Griha		9. Græceus or Greece.

- (i) in the region of the plains.
- (ii) in the region where the soil is conducive to the luxuriant growth of trees and creepers.
- (iii) where the nature of the soil is likely to yield an abundant supply of grain and water.
- (iv) where timber, fuel and fodder can be easily procured.
- (v) where there should be at a suitable distance a navigable river which should empty its waters in an ocean.
- (vi) where mountains or hills should not be at a very great distance from the residence of the King.
- (vii) and where birds and beasts can live in comfort.

215. The city is to be surrounded by a rectangular or preferably a circular wall and by a ditch. The wall should be five times greater in height than the palace.

216. There should be four main gateways corresponding to four directions (N. E. S. W.) Royal roads shall have their beauty enhanced by having gardens at suitable distances. Along the roads leading to various surrounding villages, wells and tanks should be dug. Arrangements should be made to have police stations located at regular intervals along the roads and to mark the tracks by avenues of trees.

217. In the city special buildings ought to be erected for purposes of imparting education, every such school having a boarding house for students to reside and read.

221. The four gateways should be guarded day and night by well armed men.

Remarks—These *shlokas* give us a glimpse into the then state of society. This architecture symbolises the rule of might. The history of those times was a history of strife, struggle, attack and defence. A great object was served when a castle

was constructed in such a way as to command a navigable river. These watery high-ways enabled the Ruler to impose tolls which was a source of income. The river emptying its waters in an ocean would make the city almost be a seaport. Even in our own times, the attempts to make Paris a seaport are noteworthy. For a fortification a commanding position was to be selected and when a building was constructed on a low ground, the control of the neighbouring hill was necessarily obtained. The rectangular form of the boundary wall was not very convenient as the angles of such rectangles became the most vulnerable points and to avoid this difficulty, the author recommends a circular form. Within this boundary wall large areas of lands were enclosed where extensive buildings if built, could serve as barracks for soldiers. Utilitarian considerations dictated the necessity of a ditch. Cities in Ancient India were solely built for purposes of defence, but the importance given to school buildings rouses our curiosity. If the king were a mere military leader, whose only duty was to wage wars in self-defence, what necessity was there for the author of this book to suggest that the king should construct school houses also in his city? We should not be deluded by the notion that these were mere military schools. In some other *shlokas* it has also been pointed out that the instructions imparted in such schools should be conducive to the harmonious development of bodily and mental faculties of *Brahmacharies* reading in them. The fact of the matter is that even in those days, to provide facilities for imparting liberal and free education was the paramount duty of the king.

THE PALACE

218. There should be a big central hall in the palace where the court of justice could be held. Stables for horses and elephants should have stalls and other necessary equipments. Wells and tanks should be dug in which purity of water should be maintained and these should be supplied with

236-37. The roof of a house should be tiled. In the middle, it should be elevated so that water may conveniently flow down.

The roof should be high-pitched and may assume the form of a flat terrace.

238. The height of the walls should be 3 times greater than their breadth. The boundary wall should be guarded by soldiers and by placing cannons at suitable distances.

240. The width of the ditch should at least be twice the thickness of the boundary wall. It should be full of water and be at some distance from the wall lest the constant flow of water may not affect its foundations.

THE COURT OF JUSTICE.

243. This should have 3, 5 or 7 rooms. The width of the central room should be more than double the width of the adjoining room. The ground-floor of the central hall should be a little raised. The sideways rooms may have two upper stories and the roof may be either terraced or tiled. The central hall should have only one storey. It should have four gateways and be provided with

- (1) "Pankha"—an arrangement to set the air in motion—(VATA-PREKHA-YANTRA.)
- (2) "Clocks"—an instrument to measure time—(KALA-PRABHODANA-YANTRA.)

250. An assembly presided over by the Prime-Minister should frame laws.

251. Buildings for the Prime-Minister and the Commander-in-chief should be separate and be at a distance of at least 100 yards away from the king's palace.

254. Arrange the houses or quarters in the following order.

- (1) Rich men.
- (2) Common-people.
- (3) Civil Officers.
- (4) Commander-in-chief.
- (5) Commanding officer of sub-divisions.
- (6) Cavalry.
- (7) Elephant Stables.
- (8) Cannons and Military barracks.

(9) King's Body-Guards.

(10) Artists and Carpenters and Sculptors.

ROYAL ROADS.

260-63. Royal roads should proceed from all sides of the palace. The breadth of the Royal road should be at least 15 yards and that of other ordinary roads 10 yards while that of the streets not less than 5 yards. The roads where shops are located should necessarily be broader. The foot-path which is meant only for pedestrians should not be less than 3 yards broad.

264. In capital cities there should be as few lanes or narrow streets as possible.

266. In towns, roads should have just enough convex surfaces to allow the water to flow down smoothly. They should be of the nature of the tortoise shell. (KOORMA-PRISHTA-MARGHA-BHUMI.)

267. All the houses should face the Royal roads. Lanes and dust bins should be on the back side of houses.

268. The houses on both sides of the roads should be in parallel rows. Every year the roads must be macadamized. To prevent the dust nuisance and the formation of mud and to keep the surface firm, *chunam* and some hard substance should be used. *SUDHA-SHAKARA* is the term used by the author.

In recent times, the rapid development of trade due to the introduction of railway lines has revolutionized the methods of transports and has accentuated the need for more adequate facilities for carrying merchandise from one part of the country to another. The pack-animals for transport and enormous caravans have been almost dispensed with and in the near future, the introduction of motor traction shall render the problem of road-making much more difficult. In the days of Shukracharya, the people had felt the dire need of broad and well-metalled roads and this need is only felt when an enormous volume of traffic passes on such roads which also form highways for commerce and serve us as an

advancement in civilization which the people in those days had made.

REST-HOUSES

268. Rest houses for travellers should be constructed between every two villages. The Superintendents of these houses should necessarily be Government Officers.

When travellers come and reside in such houses, the Superintendent is required to obtain some information regarding the new-comers which should be based upon the answers given to the questions asked by him to those travellers. Ingenious questions were to be asked of them not with a view to harass them unnecessarily but merely to maintain peace in the land, which would necessarily be disturbed if no check were to be exercised over people travelling to and fro. If the questions proposed by the author to be asked of such as seek shelter in these rest houses and the answers given by them, were to be recorded in a register, the Superintendent would be required to have in his possession a book, the contents of which we note below. The officer in charge would then be required to make entries in the columns marked as the following —

1	2	3
The Name of the Traveller.	His permanent Residence.	His Family connections.
4	5	6
The place where the traveller comes from	The object of his travel	His caste
7	8	
The number of persons accompanying him.	Whether he carries arms on his person	
9	10	11
Whether he has any animals or vehicles with him	His destination.	Other particulars.

If the new-comer happens to carry arms, he should be disarmed during the night and the weapons should be retained by the officer. He should count the number of occupants and close the gateways. These strangers should be well-guarded by the Police and if, in the opinion of the

Superintending Officer, they should be considered as men of suspicious character, their movements should be closely watched. Next morning their arms, if any, should be returned and they should be allowed to proceed on their journey without any hindrance. The village headman is in duty bound to look after their comforts and they should never be molested unnecessarily. There should be no teasing, harassing and uncalled-for questions. The officer's duty is only to maintain peace in the land and sincere attempts should be made to achieve that end. In maintaining the peace of the country as a whole, no attempts should be made to disturb individual harmony and make travelling, without which no education in any age can be said to be complete, a nuisance. It is not the intention of the author to discourage travelling by placing so many restrictions in the way of travellers. Or the other hand, the very fact that rest-houses were constructed at regular distances goes to show that travelling was encouraged by the Rulers.

With the plans of palaces and courts of justice laid down in Sukra niti, it is highly interesting and instructive to compare the plan of *Bascula Utpa* which was erected by Trojan in 115 A. D. There was in it a great central hall, 360 by 180 feet, consisting of a wide central nave flanked by double aisles with lower roofs. At one end there was a semi circular *apse* round which there was a raised dais for Magistrates. The roof of the *Bascula* had the nave portion considerably higher than that over the aisles. It was generally open and the aisles also were roofed.
(cf 236 and 218 *Shlokas* above).

Persian splendour and luxury culminated in the great capital at Persepolis or *Takht Jamshyd*. The great hall of Xerxes at Persepolis had an area 350 by 300 feet, and it was one of the most extensive and imposing buildings that were ever constructed in Persia.

Again, the domestic architecture in Rome also resembled in many respects the domestic architecture in Ancient India.

"In the House of Pusa at Pompeii, many of the rooms of houses facing the street were used as shops. The front door opened directly from the street into a small lobby which led to the *Atrium*—a courtyard roofed over round the sides but open to the sky in the centre. Under the central opening was a tank the *compluvium*. Three rooms at the end of the court, the *tablinum* and the *Alco* were used for storing the family archives. By the side of these apartments, a way led to the more private portion of the house. Here we find a larger court, uncovered in the centre—the *peristylum*—the roof of which was supported in the house of the wealthy by rows of marble columns. There was the dining room—*Triclinium*—and the other rooms were grouped round the peristyle while the bakery, kitchen and offices completed the establishment." (cf. 218 and other shlokas above)

The description of the palace at *Ayodhya* as given in the *Ramayana*, is almost similar to the description of an ideal capital city as described by *Sukracharya*. The following points are noteworthy:

1. The great country of *Kosala* was on the banks of the river *Strayn*
2. It was happy and prosperous and abounded in cattle, grain and wealth.
3. The great and magnificent city of *Ayodhya* was 12 *yojanas* in length, its thoroughfares were broad and principal gates large and lofty.
4. It was surrounded by a deep unassailable moat.
5. The numerous body of archers guarded the city and
6. There were assembly-halls, gardens and almshouses.

The temple built at *Thebes* by the Great *Rameses* also presents a model plan and the description brings out strikingly some points of resemblance as the following:—

- (1) The doorway gave access to a great fore-court flanked by colonnades.
- (2) The fore-court and the inner court were open to the sky.
- (3) There was the hypo-style hall.
- (4) The central portion of the roof was higher than that of the sides, an arrangement which allowed light to be admitted through stone panels which were perforated.

As a means of defence, the proximity of a hill or a mountain to a city was a necessity. From an *utilitarian* point of view, the nearness of a forest also is insisted upon inasmuch as it is a supplier of wood and furnish of fodder and leaves for manure and as it served the purpose of a hunting ground for the ruler. But above all, in a country where everything including architecture is closely associated with *Dharma*, the effect produced on the mind of the king as an observer of nature should also be taken into account. When the king goes to court the evening or morning breezes and when he sees a pation of a hill, river or a landscape, he is struck with infinite variety and incessant motion in nature. The bubbling waters below, the rolling clouds above, the restless leaves on the one side and the hum of myriads of insects on the other—all these proclaimed to the Ruler the provisional character of the world and conveyed to him a moral lesson the significance of which was never lost sight of—"clouds empty their waters for others, trees bear fruits for others, rivers do not flow for their own benefit, so, ye Ruler! Live like these objects in Nature and work for the good of your subjects. In their prosperity lies your happiness and in their greatness lies your glory."

In the fundamental principles of the metropolitan architecture enunciated by *Sukracharya*,

though there is little to be absolutely copied or blindly to be imitated, there is much to interest and instruct us. Of one thing we can be pretty certain that the Aryans were a more highly civilized race than we consider them to be and these shlokas never appear to us at least as the 'simple strains' of the shepherd sunk in primeval ignorance' but on the other hand seem to us as the very quintessence of the wisdom of the ancestors of the Hindus, nay, of the Persians, Germans and Englishmen alike. The theory that the ancient Aryans were not proficient in the art of building substantial edifices with stones or bricks and that the forefathers of the Hindus learnt the art only from the Greeks, has been well nigh exploded by Dr. Rajendra Lal Mitra in his well known book *Indo-Aryans Vol. I.* The Doric or Ionic or Corinthian influence was hardly felt and even the Egyptian and Assyrian influence was not very great at least on architecture.

Neither the resemblance of the Indian architecture nor its similitude to the Egyptian one can afford us any conclusive proof that Indian architecture was novel original. The position of the doctor is unassailable when he holds that whatever the origin or the age of Indian architecture may be, looking to it as a whole, it appears to be perfectly self-evolved, self-contained and independent of all extraneous admixture and that it has its own peculiar rules and particular features—all bearing the impress of a style that has grown from within—a style which expresses in itself what the people, for whom and by whom, it was designed, thought, felt and meant and not what was supplied to them by aliens in colour, creed or race.

Will our "Nation-builders" whether reformers or revivalists evolve such a self-contained and indigenous architecture and erect the national edifice aiming at its stability, strength and symmetry or will they remain satisfied by merely stigmatising us as those who indulge in prurient fancy and extol and exaggerate everything ancient?

EMIGRATION FROM INDIA

ADMINISTRATION OF CONTRACT LABOR.

By

MR. SHRIDHAR V. KETKAR, M.A.
(Cornell University, Ithaca, N.Y., U.S.A.)

THE ill-treatment accorded to Indian emigrants in the British colonies has been a subject of much discussion. This article attempts to present facts regarding the administration of contract labor with a view of enabling the readers to ascertain the administrative peculiarities of the system, which give ground for the ill treatment they hear so much of.

While considering this question, the laws and practices both in India, and in the colonies deserve consideration. While treating the methods of the colonies, I have to a certain extent confined myself to the examination of the administration of contract labor in Trinidad and British Guiana; still what I am saying of these two colonies can be said in a large measure of all the British colonies. The principles of administration are the same though there are differences in some minor details.

The Indian Government has first of all defined the countries where the emigration of contract labourers is lawful. Herein they have included all the British colonies, the French colonies and also those of the Netherlands. If any of these colonies wish to secure Indian immigrants, they send out agents to India. Indian law requires that these agents should be paid fixed salaries by the colonies and that their salaries should in no case depend on the number of persons they induce to emigrate. These agents have to do business through persons who are called "recruiters."

Emigration of contract labourers is legal only through the ports of Bombay, Madras, and Calcutta. In these ports there are Protectors of emigrants and Medical Inspectors, appointed by the local governments. The Protector is supposed to protect

all the emigrants, and aid them with advice. He is expected to see that the regulations of the Indian emigration Act have been complied with. When an emigrant returns from the colony, the Protector is supposed to inquire into the treatment the emigrant received either during his voyage or in the colony and to report the information to the local government.

The recruiters who work for the emigration agent are required to have a licence from the protector of emigrants, with a specification of the area within which the former are permitted to recruit. Unless such a licence has been received, to enter into a contract with a person binding him to emigrate is forbidden. The Protector of Emigrants is required to inquire into the character of the recruiter and may deny him the licence at his own discretion. The recruiters have to show the licence to the police officers or to the Magistrate when called for. The recruiter is supplied by the emigration agent with a statement of the terms of agreement he is authorized to offer. *The law requires that the statement should be both in English and in the vernacular of the locality where he is licenced to recruit and should be shown to the officers of Police or Justice when they demand it. The recruiter is required to give a true copy of the statement to the person whom he invites to emigrate. He is also required to provide for a proper accommodation for the emigrants as he may collect them for registration or for removal to the port. At the ports of embarkation, there are emigration depots which are inspected by the Medical officers of the Government. When the emigrants are registered they are brought to these emigration depots and their arrival is reported to the Medical officer so that he may go there for inspection.*

The emigrants can refuse to emigrate even at the last moment, and cannot be compelled to emigrate, though they can be sued for damages

incurred on account of their previous agreement. The vessels which carry the emigrants require a special licence. Law requires that every emigrant should have at least *seventy-two cubic feet of space*, that there should be a separate place fitted up for the hospital and that there should be arrangements for the separation of women. Unless these regulations are complied with no licence is granted. The vessels are required to keep provisions for all passengers. The vessel must carry with her a properly qualified surgeon. The emigration agent is supposed to give every facility to the Protector of Emigrants in the performance of his duties.

Let us now consider the laws and the practices on the other side; that is, of the colonies which invite these emigrants. The chief officer of the Immigration department is styled in British Guiana the Immigration Agent-General. Some colonies like Trinidad choose a more pretentious name "The Protector of Immigrants." This officer is appointed by the English Sovereign and is responsible to the Governor of the colony for the proper execution of the Immigration ordinances. He is also Secretary to the Governor in matters concerning immigration. He has a right to go to any plantation at any time to inspect the condition of immigrants, with regard to their dwellings, and hospital accommodation. He may inquire into any complaint which the employer may have against the immigrant or the immigrant may have against the employer or anybody else. He may lay the complaint before the magistrate in behalf of the immigrants and may even appeal from the decision of the court in behalf of the immigrant if he thinks that the latter is not done justice to. He is assisted by Senior and Junior Immigration Agents who are appointed by the Governor. There are Medical officers connected with the department who have the right of plantation.

In order to induce the immigrants to come over to the colony and to pay their passage both ways there is an Immigration Fund, managed by the Receiver-General. This fund is made up of various items the chief of them being Indenture Fees and Acreage Taxes. The Indenture Fee is paid by the employer who wishes to have immigrants to work for him. The employer has to state the number of immigrants he wants, designating also their nationality. The immigration officer has the power to determine how far these requests should be complied with. If he has doubts as to the character of the employers he may even refuse their application.

When a ship arrives to the port the Chief Immigration Officer assisted by the Medical Inspector ascertains whether the provisions of the law have been complied with. He makes a report on the matter to the Governor. In case there is any sick immigrant on board he is at once transferred to the general hospital. Every immigrant arriving in the colony is to be provided with food and lodging in the Immigration depot at the expense of the Government, until he is allotted and delivered to the employer.

When the immigrants are allotted, the applications of the heads of the various departments of the public service are considered first. Those of private employers like owners of plantation are considered next, and when their applications are complied with, applications for domestic servants are considered. This order is followed unless the emigrant himself expresses his choice otherwise. In making these allotments husbands are not to be separated from their wives or children from their parents. As far as possible friends or neighbours at home or persons coming from the same village are not to be separated.

Any contract made in the country of the immigrant is valid in the colonies, though some colonies have made a rule that no contract entered

into in India shall be valid unless the permission of His Majesty's Government is previously taken. The usual term of indenture is five years. A minor immigrant is not to be indentured to an employer unless the employer has made a provision for the education of the minor in reading, writing and elementary arithmetic.

The medical department of the Government is supposed to look after the dwellings of the immigrants, their rations and their hospitals. The employers who neglect to send to hospital the indentured immigrants are subject to fines. The Immigration ordinance provides rules for the payment of wages, and assignment of work. No immigrant can be compelled to work for more than forty-two hours in a week.

The Immigration Agent has to keep a register of the marriages and divorces of the immigrants and the law provides a number of rules to guide the same.

The enumeration of these provisions should have made it sufficiently clear that in the way of making proper rules for the control of the situation, very little more is to be desired. The colonies have made decent laws to give Indian immigrants justice and fair treatment. However, that Indian immigrants receive notoriously bad treatment is something which would not be denied by any fair minded person. What then is the secret of this?

One need not go too far to seek the solution of the apparent inconsistency. The laws are good enough but the question is whether they are properly put into effect. Seemingly good laws improperly carried out often do more mischief than those which are honestly unjust. They make the task of reform more difficult and distant. We ought to inquire whether the Immigration Agent General or the Protector of the Immigrants is really a protector. Usefulness and soundness of the entire system depends on the

on the virtue of this officer. If this officer is really a friend of the Indian immigrant as he ought to be according to theory, a great deal of the suffering would no doubt be alleviated. This fact is well recognized by those who by knowledge and experience are fit to give opinion on the subject. Mr. Harold H. Smith, the Editor of *Tropical Life*, London, has more than once insisted on this vital point in his monthly. Very often the Protector of Immigrants has an exaggerated idea of his personal importance and has very little sympathy with the low class Indian laborer he comes in contact with. He feels much stronger sympathy for the estate managers who are very often his personal friends and, if not friends, more or less his equals by wealth, social standing and similarity in race and religion.

What can the Government of India do in this matter? Since the early forties the Government of India has criticized the treatment of the Indians in the colonies in their despatches to the Home Government. But this criticism was of little avail. It only led to some mutual unpleasant language on the part of one government regarding the other in their despatches they sent home. A great deal can yet be done to alleviate the suffering and to make the emigration pleasant and popular. The Protector of Immigrants in the colonies is always an Englishman, and so are his immediate assistants. If the Indian Government confer, with the Government of the colonies with a view to appoint some natives of India of ability and character in the Immigration department of the colonies to positions of responsibility and should it succeed in inducing the colonies to do so, I think it would lead to good results. It should also try to have some of the magistracies in the colonies filled by people of Indian extraction to act as tribunals for Plebeian Indians. It is not possible that East Indians worthy of these offices can be found in the colonies, but men with proper

knowledge and ability can be sent for from India. If the Government of India is to recommend these men, it would certainly lead to better understanding between the Governments and would lead to the solution of the difficulties to a great extent.

The policy of the Governments of the colonies with regard to the moral condition of the immigrants is not beyond reproach. For Asiatic indentured immigrants there are special laws governing illicit intercourse between the sexes and here the ideas of morality appear to be subordinated to the economic motives. Take British Guiana for example. Here the law requires that the punishment to the indentured immigrants for the offence of cohabiting with an immigrant woman with threats of murder or injury, should not exceed one month's imprisonment with or without hard labor. Again, for enticing away the wife of another the immigrant should not be fined more than twenty-four dollars. (Ordinance No 18 of year 1891 see 157—160). The labor which the immigrant gives to the colony is fixed and the Government of the colony does not wish that its amount should be diminished by the crimes of the immigrants.

Inasmuch as these laborers return to India and become again members of Indian society it is the duty of the Indian Government to see that the colonies do not corrupt the morals of the emigrants by loose and pernicious legislation and it is greatly to be desired that the Indian Government would consider this matter.

REPRESENTATIVE INSTITUTIONS In England and in India.

BY .

MR. KESHOLAL T. SHAH, B. A.

The Indian student of English history is filled with a profound admiration, not entirely unmixed with a certain sense of undefined envy, as he reads of the struggles, the vicissitudes and the final victory of the representative institutions in England. In his mind the English Parliament is indissolubly connected with the ideas and images of Chatham thundering against Fox and Murray and intimidating Newcastle, of Pitt defying the trenchant invectives of Fox and North and sustaining the eloquent criticisms of Burke, of Peel encountering Canning and Gladstone Disraeli, of Cobden and Bright and Parnell declaiming against heavy taxation and bad representation and disgraceful maladministration of the sister kingdom. But when, with this idea in his mind—an idea bordering upon profound reverence—he comes to see for himself at close quarters the arena where the heroes of Britain fought much harder struggles in peace than the maddest adventure of the most quixotic champion of the mediæval period, when he begins to perceive the hidden springs of this mighty machine, it cannot be denied that he experiences a sense of sad disappointment. After once attending in the Strangers' Gallery during a parliamentary debate in the House of Commons, the Indian gentleman, if he has already attended the sittings of his own Imperial or Provincial Legislative Councils, cannot help thinking that his conclusions with regard to the comparative merits of the two legislatures, if it be permitted to dignify our Councils, with that august name—were too hasty and exaggerated, if not entirely unfounded. For to his mind, the Indian legislature even at its most important sitting for passing the budget, has been a mere farce, a feeble and almost disgraceful imitation of the Imperial legislature, a counterfeit

legislative chamber where the measures of the Government are invariably a foregone conclusion, where irresponsible demagogues, bidding for popular notoriety, launch reckless criticisms without the sobering fear of ever being called upon to make good their criticisms, where the official members keep up a smile of contempt or indulgence as they see a bitter adversary running full tilt against the windmill of their measures, or a timid supporter re-echoing like a parrot the arguments of his patrons, speaking in vague generalisations, without facts, without confidence, without judgment; while, on the other hand, the idea of the Imperial Parliament has been associated in his mind with powers whose very vastness staggers the denizen of a despotic country. Comparing the two in their actual working, however, in a view of unbiassed criticism, he finds that, if he cannot change his opinion with regard to his own legislature, he must perforce modify his conception of the powers of the individual members of Parliament.

The reasons which induce this modification are not apparent on the surface; they need some insight into the working of the parliamentary machinery of to-day. When such an insight is obtained, the student understands why complaints are heard on all sides against the Government of the day, whichever party happens to be in power. It is alleged—and, it would seem to an unprejudiced observer, with very good reason—that the Government absorbs more and more the time of the House, and that the private member, practically deprived of all his legislative initiative, is relegated to greater and greater obscurity and insignificance till it may fairly be doubted whether the will of the people is at all effectively attended to. For the strict party organisation and discipline prevents any independent member from rebelling against the party chief, who, if he is in office, holds the most formidable weapon of a threat of dissolution in his hand which will be mercilessly used if

defection or desertion crippled the party and frustrated its programme. And we may presume that despite their professions of attachment to their constituency, members of Parliament are not at all eager to have frequent meetings with their electors, and more so if they are deprived of all party support. In effect, therefore, the private member—and the phrase embraces all those who do not hold office at the moment—is no better than an automatic machine for registering the decrees of the leader inside the House; and a sort of an animated gramophone to repeat the burden of his song outside. So much so that, by a strange perversion of facts, the extremists of the Opposition—whatever denomination they are known by—do not scruple to assert that at present the representation is the worst since 1832. The advocates of the party leaders have publicly admitted the increasing disabilities—there is no other term more expressive of the fact—of the private member; but they contend that he still performs the most important functions of expounding the policy of the leaders to his constituents and of keeping the leaders informed of the changing attitude of the electorate. Even if we accept this explanation it is but an imperfect mitigation of an admitted and existing evil. As a matter of fact, no such ‘important’ functions are discharged by the rank and file not because they are incapable or unwilling to perform their duty, but because even in this case they are deprived of all opportunities. The increasing activity of the leaders absorbs the attention of the whole country in them, while their followers in Parliament are returned because they are the pledged supporters of the few favourites of the nation. Nothing appears more conspicuous in a general election to an observer than the way in which Ministers and ex-Ministers fly round the country from one end to another in one ceaseless whirl of battle, explaining their policy, animating, exhorting, inducing, their followers, supporters or

waverers and denouncing the policy—and not infrequently the personality of their opponents. And even during the Session hardly a day passes without a speech of some Minister on the question of the day. The scientific observer of these institutions, if he desires to search for the first cause cannot but feel that even the decisions of the electorate are formed much less by the force of logic than by the strength of party feeling. Without impeaching the famous intuitive political sagacity of the Anglo-Saxon race—at least we are led to believe in it by our professors of English History—we must say that the public follows the prominent leaders more like dogs or other pet animals following the signs of their masters, than like intelligent and rational beings who can think and act for themselves. For what can such a glaring instance of popular credulity as the rejection of a proposal for a referendum prove if not this fact? It had been for a long time the dream of all true social democrats, and was, of course, anathematised by true Tories. But when it was known that the proposal was embodied in his programme by the leader of the Conservatives it was distrusted and rejected by all true Liberals and Radicals and even Socialists. Why? why, because it was held out by a man who was not supposed to believe in a Government of the people by the people for the people, and that therefore there must be some sinister motive underlying this obvious “Dodge.” The all-pervading influence of the party spirit is so great that it will not be far from the truth to assert that England is to-day really governed by a small and compact band of very powerful and influential leaders of public opinion—I had almost said of political adventurers without casting the slightest imputation on the honor, integrity and patriotism of these men. And if there is an individual in this band whose towering personality represses all insubordination amongst his colleagues, and who can obtain and retain the esteem and confi-

dence of the electorate, England has a far greater chance of an autocracy to-day than ever she had under the most despotic Tudors.

Though they may be placed before the public in an unpalatable form, these are unquestionable facts. All parties admit them to be true, though all suggest various—and far from mutually harmonising—explanations of the evil. To one who observes without bias or prejudice it would appear that the real pain is in the stomach but the patient presses his head as if that would ease or diminish the pain. At a later stage of our investigation the true explanation will be made more clear. Suffice it to say at present that the principle of representation—one of the greatest discoveries in political science for which the entire credit is due to England—runs a great risk of being attacked and destroyed by the principle of party Government in the very place of its birth as far as Imperial Legislature is concerned.

It is strange to observe that one of the branches of the parent stalk, transplanted in a foreign clime, among a people, who had, indeed, the germ of representation, but who could not develop the germ by adverse circumstances, shows signs of a healthy and vigorous growth. It has been said above with what feelings the average educated Indian regards his Imperial Legislative Council in India when compared to the mighty Parliament of England. At first sight the opinion seems to be not without foundation. Crippled as it is by an overwhelming amount of business, the English Parliament still affords numerous opportunities for distinction and service to the country to every private member. As a matter of fact all Cabinet Ministers were not born the sons of Ministers. On the other hand, in India we perceive—excepting exceptions—that the members who are supposed to represent some body or some interest are distinguished by that mediocrity of talent which would induce them to try to represent the few of their constituents, but which would not

resist before the frown of a Minister, much less before the unsparing denunciation by an unfriendly, but nevertheless, an influential journal. Hence we see the farce. It is far from the intention of the present writer to speak with disrespect of those great Councils of the State where all the wit and wisdom and experience and ingenuity of the country is supposed to gather. But he cannot help thinking it a sad mockery of the principle of representation, when he thinks of one gentleman declaiming against military expenditure every year, and pleading for primary education with incontestable facts and figures—but all in vain; and of another gentleman advocating the cause of Gujerat agriculturists in the Bombay Council for one does not know how many years passed without effect—and all the time both these gentlemen are supposed to be representing the people's sentiments. In spite of this flagrant divergence between theory and practice, the historian of the future will admit that the great principle of representation was making silent progress all this time under all these seeming obstacles. We have as yet no party in India, at least no recognised party. We are prone to regard it in the heart of our hearts as an evil, and to-day it really seems to be so. But notwithstanding this feeling, it may be asserted that the absence of party facilitates the speedy acceptance by the authorities—whenever they are in a mood to accept—of popular grievances from men of all descriptions. The same lack of partisanship promotes a greater co-operation between members who come from the most distant parts of the Empire. At the same time it may be observed that this very lack of party organisation stimulates the growth of a class of reckless critics, whose extravagant demands the Government may safely affect to treat with contempt. Their rise does not make the Government suffer, nor does the contempt of the Government make them suffer. The only party suffering is the country which is bereft of all progressive legislation for want of

co-operation and sympathy between the Government and their irresponsible, and occasionally truthful, critics.

Paradoxical as it may sound we must confess that we have no ministerial domination in our Councils in the sense in which such a phrase would be accepted in the House of Commons. Of course the Executive is all-powerful, and initiates and controls all legislation. Nor need they ever fear at least under the present constitution—a vote of censure or want of confidence. But yet they do not, they cannot, tyrannise over a particular set of men, and hold their existence in their hands, in the same way in which the leaders of the party in power do in England. This ought to promote a greater independence amongst our Councillors, and we may assert, that were extreme diligence not applied in the selection of that mediocre non official majority, such an independence would very speedily be developed. Here comes in the radical flaw of our Councils; there is no real representation of popular opinion, and consequently the state of affairs results as we see.

We cannot stop our survey, brief and imperfect as it is, of the working of the Representative Institutions in the two countries, after looking only at the central legislatures. Passing from the Parliament and the Legislative Councils, to the Town Councils and County Councils of England or the Municipal Corporations of India we make some new discoveries. Though not entirely bereft of party spirit, the Town Councils present a model of a Representative Institution, efficient and democratic as any such institution could hope to be. Space would not permit us here even the briefest account of these modern descendants of the old Aryan village communities. Suffice it to say that in their deliberations they exhibit all the good sense and keenness which characterize the English people. At the same time the greatest deference is shown to popular will as expressed at elections. The same tribute may be

unhesitatingly paid to their executive functions interspersed as these powers are among a medley of co-ordinate authorities often conflicting with, and seldom exclusive of, each other. Logical accuracy will hardly ever be found in the division of powers in any typical English institution. These remarks are applicable not only to the enlightened Councils of cities like London, where the successful experts in every walk of life may be presumed to be elected, but even in those remote districts of Coal fields and Iron mines, where the Council Board is not infrequently adorned by actual operatives in the mines, the same characteristic success of independent, unfettered Representative Institutions in a narrower sphere is visible.

Let us now inspect the representatives of the English Town or County Councils in India—the Municipal Corporations. The presence of a large official element even in the foremost city Corporations would persuade a stranger to believe that these Corporations are not independent, and democratic; and this belief would tend to be strengthened if the stranger glances at the voting qualifications for the election of the City Fathers. In spite of these apparent obstacles to the progress of the democratic principle, we must admit, when we have narrowly examined the working of these bodies, that they have within them the principle of a strong vitality. In truth, the representative principle nowhere exhibits such marked success in India—a country supposed to be incapable of any self-government—as in these Town Councils. On their narrow stage they have acted their parts in a way which reflects undimmed lustre on the master who controlled them, and on their own inherent capacity for self-government. Even in the more backward parts of our country these institutions provide a school for learning the art of self-government which no amount of philosophic disquisitions in the College halls could ever have done. But in this connection it may pertinently be remarked that the principle in question would

have progressed at a continuously accelerating rate had it not been hampered by two almost insurmountable obstacles. In the first place the difficulty of acquiring a foreign language, so well as to be able to express all minute shades of sentiment on an intricate question of public welfare, still keeps back the best portion of the public in these country districts. Great as this loss is, it is difficult to see how we can get over it. All people cannot acquire a foreign language, because the requirements of the struggle for existence makes it impossible to devote greater time to the acquisition of another language. We can neither expect, much less compel, the officers in the district to learn the vernacular of their districts. The expectation of regular promotion and transference from one place to another destroys any desire, if such there be, to acquire the dialects of the districts they are ruling for the time being. The suggested complete autonomy to the people would seem too premature, and certainly not prudent for the rulers or the ruled. We can—we must—then, only trust to Time to work its silent but effective revolution in this case. Another equally great difficulty is in the inability, if not the unwillingness, of our people to adapt themselves to the new ideas of Municipal requirements, always changing in a progressive civilization with every new advance in science. This is a negligible quantity; but we may hope that here, too, Time's equalising influence will run to the rescue. While these obstacles exist, it cannot be denied that the advancement of Representative Institutions in India will be greatly hindered.

Brief and superficial as this survey has been, it reveals some striking facts about the working of the Representative Institutions in England and in India which may well furnish us with maxims for our guidance in future. The complaints about the working of the central Imperial Legislature are due to a cause, which, though present to the minds of all, is not openly admitted. The Parlia-

ment, in plain truth, has too much work—far more than it can be legitimately be expected to get through with anything like a complete discussion of the subjects. How much power the Parliament has delegated to subordinate bodies for making byelaws will be evident to anyone who compares the Statute Book of the eighteenth century with that of the nineteenth. In the former, the Parliament never seems to have risen to the dignity of a general proposition. It viewed with extreme jealousy all Legislative power that could compete with it. In the last century it confined itself to enunciating general principles leaving the particular departments such as the Local Government Board, or the Education Board, or even the Crown in Council—once the sim of Parliamentary distrust and jealousy—to work out their own byelaws. We may take but one instance to prove the altered state of affairs. In 1768, Lord Chatham, by an Order in Council threw open the English port to foreign trade; but for this Act neither his dignity nor the memory of his past services could save him from Parliamentary censure, and an act of indemnity gave but a weak sanction to the exercise of Prerogative even by the Great Commoner. Exactly a hundred years later, another great Minister, failing to induce the Parliament to abolish the system of purchasing military commissions, utilised the obsolete weapon of Prerogative and abolished the system by an Order in Council in the teeth of Parliamentary opposition, without fearing any censure. But in spite of such a delegation, in spite of all night sittings Parliament can scarcely get through even the most necessary seasonal legislation. Means have therefore to be devised to ensure the passage of the necessary bills within the necessary time, and in their maturity these means suggest more than a mere metaphorical affinity to the odious Guillotine. Their action gives colour to the statement that the most important bills frequently passing the Lower House without

most important clauses being touched. All this unmistakably points to one issue: further devolution of powers must ensue for sheer want of time to cope with all demands, if the Parliament does not desire to reduce itself to being an engine for ministerial despotism.

It might seem that this great emphasis on the working of the Imperial Parliament has, at best, only a remote bearing upon the Indian Councils. On the contrary, this examination brings home to us the truth that over centralization of powers in a single assembly proves ultimately injurious to itself. The proper sphere of central Legislatures is the enunciation of general principles, and ultimate control of their working. Local problems with their details had best be left to local bodies, without the power, position or prestige of the central authority being impaired at all. The success of local bodies to meet with their own wants is evident even from the most superficial survey of their working.

Another great evil of over centralization, more strikingly apparent in India than in England is that Reform is very slow, seldom spontaneous, never ungrudging, wherever the permanent officials control the Legislature. Inured to routine work, the official mind instinctively abhors any change that would require a complete recasting of long formed habits. The heads of departments in India enjoy a permanence of tenure, which does, perhaps, procure a great efficiency in administration, but which certainly bangs, bars, and bolts the door against all timely reform. It would be an inestimable boon, if, by some means, our officials could be made to enter into the feelings of the people, to grasp each rising want at its first appearance, and to meet it as soon and as well as possible. For the present, however, this is an ideal, destined, like all ideals, to remain for a long time a subject of official success and popular desire.

The problem before us in India with regard to these institutions is twofold. Though they are at present scarcely out of their infancy—at least the great central Councils—it is highly undesirable that extreme party spirit—which eventually degenerates into a mere faction fight—should be consciously promoted. On the other hand, it seems a strange coincidence, if not a mysterious decree of Fate, that all English speaking nations, whether independent countries like the United States or dependent colonies, tend to produce two parties in the State. Our own Congress has shown, even while its deliberations are hardly worth the paper they are printed upon, that if we are to acquire and assimilate English civilization, we must be prepared to accept England's legacy of the Government by party. It is, therefore, premature to congratulate India on her absence of party feeling. Under these circumstances let it be the conscious endeavour of Indian statesmen, irrespective of their race, to eliminate, as far as possible, the chances for irresponsible and reckless criticism of the party in power. The sobering cares of office exert almost a miraculous influence in the transformation of ideas and sentiments; and the mere possibility of ever being called upon to make good their criticisms, more effectively muzzles all political opposition than even the most rigorous of autocracy could ever hope to do. To this end—the conclusion seems irresistible—the highest executive offices should not be allowed to remain the unchallenged monopoly of one class alone, thereby rendering that class indifferent to all wholesome and deserved criticism. It is to be hoped that the next step in the progress of Representative Institutions in India will be in the direction of a further expansion of our Legislatures, making them more truly representative of the people, allowing them a greater control of the Executive, and increasing the chances of those whose natural and acquired merits are rewarded by the confidence of their fellow-countrymen, to be liable to discharge executive functions in conformity with the principles they have been advocating, and without imperiling the interests of any class or the existence of the State itself.

Indentured or Contract Labour.

BY

MANILAL M. DOCTOR M. A., LL. B., Bar-at Law

"Except when he is really at his wit's end, either on account of family dimensions, or perhaps absence of means of living, he will not go"—Lord Sanderson.

THE above head line is a misnomer. The system of labour designated by the expression cannot be described otherwise than by calling it *forced labour*. Men may call white black, and bitter sweet, but the senses cannot be deceived. The word *contract* connotes liberty or choice and the word *indenture* refers to the duplicate agreement of two persons to one and the same thing—there must be a meeting of minds, say the jurists, to constitute a true *contract*.

Now in the case of our ignorant villagers—men and women—boys and girls—do they possess the education, intelligence or even information to understand the terms of service in foreign countries, granted that recruiters were truthful and honestly anxious to explain the real conditions? It is *however* officially admitted—and as every one knows officials are not prepared to admit anything until their very last device at concealment or evasion cannot stop the truth from crying out—that the recruiters as a class are the worst off-scourings of our cities and that "those who tell the most lies get the greatest number of coolies."

Thus, there is, and can be, from the nature of things, no meeting of minds between the ignorant villagers and the coolie recruiters. How then can there be any *contract* or agreement between the Emigration Agents in Calcutta or Madras and the coolies? No—but it is said that the contract is between the ignorant village boy or girl of the District of Arrah, for example, and the highly educated and wily planter lawyer in a distant colony like Fiji or Trinidad whose legally equipped mind meets across thousands of miles of sea and land, the mind of our ignorant and over confident

villagers, who are recruited to work for the former. And even then the coolies do not *contract* to serve a certain estate or master until after they reach their destination. So that, really speaking, thousands of raw boys and girls are induced, threatened, overawed, kidnapped, abducted or forced to *contract* to work for the undefined and unknown planting communities in foreign countries, about whose history, geography, climate, people, government and other conditions even our political leaders have no information at all. The Protector(^{of}) Immigrants from Mauritius told Lord Sanderson's Departmental Committee, unblushingly, that he charged different prices for different *contract* labourers according to their age, health, strength and size. It is a fatal coincidence that the colony which has the honour of inventing this system of indentured Indian labour should, through the mouth of its Protector, "let the cat out of the bag" and enable us to prove that the system is nothing but slavery, pure and simple, gilded as *contract labour* to satisfy the forms of modern civilization. If *contract labour* were *contract labour* in reality, as it is in name, it could never have been so cheap and welcome to the colonists in lieu of slavery, in reality and name, which was officially abolished. The majority of British Imperialists and capitalists (who have invested their money in colonial industries) seem to swallow and even conceal the evils and immorality of sending thousands of men with a complement of 33 women for every hundred of these men to distant lands, where it is considered *justice* to send people to *gaol* for absence from work, non completion of hard tasks, refusal to be treated at the hospitals on plantations, insubordinate language, etc. For these real or supposed crimes the prisons of Mauritius treat 40 per cent. of their inmates to free board, residence and medical care, during the slack season (after crop time) when the planters do not really want the men for work and can save themselves the expense of their maintenance by simply transferring them to the

care of the Prisons Department. These men, as a rule, are so anæmic that, as the Superintendent of Mauritius Prisons says, they have to be given special food and medical care during the incarceration. Mr. Bateson, an ex-Magistrate of Mauritius (whose very appointment was resented by the elected representatives of the planters in the Governor's councils and who was made so uncomfortable subsequently that he resigned his post in disgust) says: "the position of indentured coolies when charged in the courts is hopeless—justicia they get only by accident—they are deterred from giving evidence themselves and unable to procure evidence The coolie is absolutely defenceless. . . . I WAS A MACHINE FOR SENDING MEN TO PRISON for the convenience of the employers." Again the same honest Englishman says "Their plight is equally unhappy when they bring a charge for assault. Witnesses from the estates will not come forward "from fear," indeed it is practically impossible to substantiate a charge against an employer—the hand of every man is against the complainant and the police are quite as corrupt as in India." What stand can a poor nervous illiterate, ill-fed, ill-clad, ill-treated and timid Indian make before the courts of a European colony, where the magistrates and lawyers are as a rule cousins, nephews, brothers or sons of planters and, therefore, incapable, being only human beings, of doing or obtaining justice to or for a homeless and defenceless stranger, who neither understands the language nor the procedure of the courts before which he may stand, charged or prefer a complaint? But it is said there is the Protector of Indian Immigrants—their *mayhap*. It is seen from the evidence given before Lord Sanderson's Committee that real Protectors like Mr. Heslop Hill are an exception and that even this gentleman was quickly got rid of by the planters at enormous cost to the Government of the Straits Settlements.

All "Protectors" may not be as bad as Com-

mander Coombs of Trinidad, but they all as a class belong to the category of official parasites who do just enough work for the planters and the labourers to keep the system going, following the line of least resistance and smothering the complaints of Indian labourers against their employers by branding them "frivolous" unless the grievance be too enormous or loud to be screened under official platitudes and cant. On this subject Lord Sanderson's Committee are obliged to blame Protector (?) Trotter of Mauritius, but they use carefully the following guarded expression, only in their official report "The Protector takes too narrow and formal a view of his powers and duties" in not refusing to supply coolies to estates against which there are frequent complaints, ill-treatment and so on. But the Protector (?) of Mauritius has a daughter married to one of the leading planters of the colony and has invested his fortune in the sugar industry. How can this Protector (?) be expected to do otherwise than shield the planting interest by even perjuring himself in their favour, if need be, when in extreme and exceptional cases reconciliation, compromise, threats, promises of better treatment, lighter work, increased rations, higher wages and the rest of the armory of colonial tricks, fail to persuade a labourer or group of labourers to go back and resume work after long-suffered brutality and oppression on sugar estates? Though this Protector was appointed after the Labour Commission of 1874 and therefore expected to execute and watch their scheme of reforms, he has allowed the Government of Mauritius (hitherto exploited by a certain clique of planters represented by Sir William Newton and M. Leclézio not only in the Legislative but in the Executive Council of successive Governors) to get rid of extra colonial labour Magistrates and replace them by the relatives of local planters, without even the knowledge (not to say sanction) of the Government of India, whom it was his duty to warn of this change. One can well understand the situation of

things in this colony by mentally picturing to oneself a small Indian State of the area of 700 square miles, where everyone knows almost every body else, where groups of influential families supply recruits for the revenue, judicial and administrative posts and where from the very nature of things, favouritism, nepotism, corruption, official co protection and tyranny are necessarily grown for the mutual profit of the members of an oligarchy of race, creed and clan, who among themselves exploit the labour of a subject race and share the riches accruing from the system. "The whole Civil Service of Mauritius is rotten from top to bottom" said Mr. D.C. Cameron, the then Colonial Secretary, in 1907, who was on this account got rid of, by the planters of Mauritius. But this does not concern us, except as indicating what justice our indentured labourers can expect at the hands of magistrates and others, who are supposed to be placed there to see justice done. One magistrate is known to have perjured himself by saying that he personally explained all the conditions of "indenture" to labourers, including the one relating to the transfer or sale of labourers, from one employer to another. No magistrate ever takes the trouble of (nor has time to do more) mentioning more than the period of indenture and the amount of wages—many do not do this even and some do not see the faces of labourers, who are supposed to indenture and sign their contracts in their presence. False personation is not unknown to planters besides the ordinary tricks of giving the men drinks, bakshis, advances of money, promises of land, etc. Inducements, threats, and persecution are seasonably used a few days before the expiry of the first indenture to get the man to consent to a renewal of his contract. The law says, no second contract can be passed whilst the first is in existence. But the planters of Mauritius dodge round this provision by terminating the first contract a few days or months before its stipulated period (which can be done by mutual consent)

and getting the man to reindenture, whilst the discharge certificate of the first indenture is in preparation with the clerk of the Court or in the hand bag of the planter himself or at any rate, under his control. If the man consents to renew his contract the discharge certificate is torn up in the presence of the magistrate—but if he refuses, it is not handed over to him and the employer insists that the unexpired period of the original contract must be served, if the man wants his discharge. But when that period has run out the man is put off, with various excuses, such as his having to make good "lost days" or days of absence during the expired contract and thus the man is detained from day to day indefinitely, mentally and morally tortured, given too hard tasks, ill-treated and coaxed by turns, with a view to get him to continue to serve the estate on the old conditions. The clerks of Courts dealing with contracts are as a rule the proteges of planters and help the latter in putting off their labourers under various pretexts—and the magistrates connive at this, if not actually support the injustice. Prosecutions under the labour laws for habitual idleness, disobedience of orders, non completion of tasks, insubordination etc. are undertaken in order to obtain re-indentures—such cases being liable to be withdrawn at the mercy of the planters—and even criminal prosecutions under the Penal Code have sometimes the same object in view. Further those who own or possess land and cattle are threatened with boycott of sugarcane, stopping of water and fodder supply, rights of way etc., which in Mauritius are not independent of neighbouring employers of labour, who use every means in their power to obtain contract labour. Recently a good number of free Indians were recruited by false pretences and fictitious promises to consent to leave their homes and brought down to Mauritius without knowing where they really were going, to sign contracts of service on arrival in Mauritius, with the help of some one or other of ordinary tricks referred to above.

We must peremptorily ask the Government of India to, immediately abolish not only the future emigration of Indian boys and girls under contracts of service but the slave system of indentures and re-indentures in the colonies disguised verbally as contract service.

The Presidential Campaign In America.

BY

MR. SUDHINDRA BOSE, M. A.,

(Fellow of the State University of Iowa.)

AMERICA is again caught up in a whirl of politics. The Presidential boomers have sounded the pre-nomination Presidential Campaign. The belligerent candidates with their aggressive lieutenants are rapidly advancing to capture the nomination. The newspapers are filling their columns with excited accounts of quarrels, jealousies, and intrigues of these politicians. The situation is daily growing intense. "Nothing but death," announces President Taft, a candidate to succeed himself, "nothing but death can keep me out of the fight now." All this excitement and turmoil becomes peculiarly significant when one calls to mind that such a political fight occurs once every four years, and that the actual election does not take place till the second Monday of next January. The present writer has been through two presidential elections and is now facing a third. The coming election, however, promises to eclipse all his previous experiences.

The President of the United States is nominated at a national convention. The delegates to this convention are elected either by caucus in convention or by primary convention. The convention is held in some large city about the middle of June and continues for four or five days. It is attended not only by the accredited delegates, but by a large number of spectators, including the Senators, Representatives, politicians, "mere" men and women. Of course the sight seers have no votes in the convention, but they number from fourteen to fifteen thousand as against eight or nine hundred delegates.

When the convention assembles the Chairman taps the table to call the meeting to order with a

gavel made of wood from all the forty-eight states in the Union. Then he proceeds to give what is known as the "key-note address." In this set speech he paints in gorgeous colors the doctrines of his party, boasts of its achievements and eulogises the administration of the President, if he happens to be in sympathy with him. The speech may create wild excitement.

At the last Republic convention, the mention of President Roosevelt's name by the Chairman called forth a tempestuous cheering, which actually lasted for forty-eight minutes. Just as the Chairman had said that "Roosevelt was the best abused and most popular man in the United States," the fifteen thousand men that packed the vast Coliseum began to cheer, howl and *hip, hip, hurrah*. In a moment pandemonium was let loose. All the people were as though caught in a tornado of enthusiasm. Handkerchiefs, coats and hats sailed aloft. Flags, pennants and parasols were flattered in all directions, and the cheering that huge throng inaugurated was baffling, overwhelming and thundering.

After the Chairman has delivered his address, and several minor committees have reported, the committee on resolution presents the "platform." The planks of the platform represent the programme of the party and indicate the issues on which the coming election is to be secured. If the party's nominee is elected he is then supposed to carry out this programme during his administration.

The platform having been adopted, the next thing in a convention is the nomination of the candidates for the President and the Vice-President. The number of nominations for the President has been seldom less than five and scarcely more than twelve. The nominee in the Republican party, is declared elected when he has an absolute majority of the whole number voting. If none of the nominees gets the requisite majority, the ballots are taken again and again. The friends and "workers" of the nominees "plough around"

among the delegates and swap their votes. The delegates, when they realize that there is a small hope of electing their favourite candidate, "smoke him out"; then they combine and swing their votes to one they wish to support. This method of nomination often unexpectedly weakens the strongest men and leads to the success of an obscure but shrewd politician. It is interesting to note that while General Garfield was nominated in 1880 on the thirty-sixth ballot, President Taft got the nomination four years ago on the first ballot.

Following the nomination of Taft there was a wild demonstration in the convention. An ear-piercing cheering, in honor of the Presidential candidate, continued unbroken for twenty five minutes. The band played and the crowd yelled. It was a thunderous noise. Some of the delegates mounted their chairs and waved Taft flags as they shouted vociferously. Others raised huge Star Spangled banners and paraded up and down the aisles. Men again and again cried "S'down," "S' down," "S'down"; but no body ever sat down. Their voices were drowned as if in the roar of the Niagara.

I have alluded thus far only to the Republican party. There are, of course, other parties, but the Democratic party is the next in importance and strength to the Republican. The doctrines of the Democratic party are in many respects the opposite of the Republican. The Democrats believe in more individual freedom and less centralized Government. Although the Democratic party counts many able men in its ranks, since 1860, it has been broken into so many irreconcilable factions that it has, with two solitary exceptions, utterly failed to command the confidence of the country. The Republican party, on the other hand, advocates a strong national Government. It seeks to protect American labor and industry against foreign competition by high tariff. The Republicans have been in control of the Government ever since the Civil War under President Lincoln, with

the exception of two Cleveland administrations.

All the different parties—and there were eight of them last time—hold their national conventions and nominate their presidential candidates; but the work of electing a President is not accomplished with mere party nominations. Indeed, it can hardly be said to have begun. For the members of a party, much less those who have no party affiliation, are bound to vote for a party. Hence the voters have to be "educated" to accept the views of the party managers. This sets to work a country wide political machinery. The national convention, right after the presidential nomination, appoints a national committee to carry on a campaign for the election of its candidate. The committee is made up of one member from each state. It is largely responsible for the conduct of the campaign. It prepares campaign literature for the voters, sends campaign news to the press, assigns speakers and raises money.

There are three chief committees besides the national committee: they are the township committee, the county committee, and the state committee. Each one of them works in its limited area for the election of the party candidate. Thus the work of the national committee is directly supplemented by each of the state committees in every state. The state committee organises an aggressive, energetic campaign. In addition to what literature it receives from the national or central committee, it publishes political pamphlets discussing the national and especially state issues. The campaign literature is "humanely interesting." When there is not much argument to advance, the "literature" is highly spiced with personalities, denunciations and invectives of the most torrid kind. One of the great purposes of the literature is to reach people who do not generally come under the direct influence of the "spell binders." For this reason Mr. Bryan, the prince of the spell binders, the democratic nominee for the President in 1908, had his speech,

"Shall the people Rule?" translated into a dozen foreign languages spoken in the United States, and had a million copies placed before the eyes of the voters. The phonograph is also pressed into active service. Those who do not care to sit down and read in cold print are given a chance to hear the canned speeches of the most popular orators in phonographs. However, it is impossible to run a political campaign without live orators to enthuse the people and to organize support. Sometimes the committee has as many as seventy or eighty speakers on the string at a time. The committee has to arrange dates and places for the speakers, and provide for their reception and entertainment. Besides engaging speakers, it employs a large number of paid agents to canvass the state. They meet the voters and prepare the polling lists, classifying the voters into friends, enemies, or doubtfuls in respect of their attitude to the party. The hottest fire of the campaign is concentrated in those parts of the country where the doubtfuls abound. Last, not the least, the state committee has to find all the money it spends for the state campaign. It receives very little help from the national committee.

During the campaign months the brass-band parades and torch light processions are the order of day and night. I cannot believe that these demonstrations help win many votes,—they are so spectacular, so circus-like. But the Americans are of opinion that they develop red-hot campaign enthusiasm. Granting that demonstrations succeed in creating artificial enthusiasm, I am still inclined to think that the average American will vote red or white because his father voted that way, and not because he is over-nice as to the justice of any particular principles.

Three days before the last election I well remember how a monster Republican parade was held in New York in honor of the Republican candidate Taft. Ninety thousand Republicans with bands playing and colors flying marched

through the streets of New York from ten o'clock in the morning to seven in the evening. It was a very cold and windy day, but half a million people choked the streets to see the parade.

The vast army of marchers represented the Businessmen's Association of the city of New York. It was made up of all trades and professions of the Republican persuasion; the hide and leather trade formed one company, the wholesale dry goods another, the lawyers the third, the University students the fourth, and so on. As the parade passed through the gaily decorated streets, it was lustily cheered by a boisterous crowd; but the paraders themselves were by no means silent. They too were letting out lots of steam and singing various "campaign refrains" expressive of their sentiment. One of these refrains was:

Hurrah, hurrah! we have them on the run;
Hurrah, hurrah! the fun has just begun;
Keep it up till election day,
Then vote from Sun to Sun.

It has been the general custom for the presidential candidates, until the last election, not to make a personal canvass for their election. They are to stay at home and make a "front porch campaign." That is to say, they are to remain at home and receive deputations and delegations from different states at their front porch, instead of going out seeking their votes. It is the general consensus of opinion that a becoming reserve should hedge about the presidential nominees. Time, and again candidates violated this unwritten law, only to pay for their folly by sweeping defeats at the hands of the voters. President Franklin Pierce remained at home, but his rival General Winfield Scott stumped through the country, and as a consequence, was "snowed under" in the election. President Harrison followed the example of President Pierce and was rewarded with a triumphant return to the White House. Coming to more recent times, we find the martyred President McKinley settled on his front porch at Ohio, from

graft in English politics may not be apparent to a superficial observer, nevertheless, it is there just the same. Graft succeeds in hiding itself in England because it has been worked there to a perfect system, reduced to a fine art. When a wily politician seeks a parliamentary election he proceeds to "salt" his districts. He gets up smoking concerts, flower show concerts, even theatricals, and then distributes freetickets among those where they will "do most good." A notorious feature of the English graft is well expressed in the common saying, "pound for peerage." The easiest way to raise funds for campaign expenses is the promise of "honours," sale of knight hoods and other titles. It is an open secret among the English politicians that a title hunter can buy a title for sixty thousand rupees and up. "Though the present Liberal government," wrote a noted publicist four years ago, "when it first went into power made a strenuous attack on the House of Lords, it recently has come to light that the Liberals have created more peers—that is, conferred honorary titles in exchange for contributions to party funds—than did the previous government of Conservatives and Tories." Is not this the same as buying votes? Is not this downright bribery?

A few days before the presidential election comes around, telephone posts, telegraph posts, lamp posts, fences, gates, public buildings, all are plastered over with 'Instructions to voters,' 'Specimen ballots' and other election literature. The ballot is a large sheet of paper. On it are printed the names of different parties with those of their different candidates for all sorts of offices, including that of the President. The voter marks on this paper the individuals or the party lists he wishes to support.

I recall very vividly the scenes at the presidential election four years ago. According to the old people who have lived here all their lives, the election night in 1908 was unusually quiet and

mild. But to me it exceeded anything I have ever seen on the streets in noise and excitement. We went down-town to see the election results displayed from the newspaper offices in the evening. Amid yells, whooping, laughter and cat calls, thousands of boys, girls, men and even finely dressed women, hysterically shouted for their favoured candidates. Young men and women carried small feather dusters, known as ticklers, and brushed people's faces as they went along. A cool crisp wind was sharply blowing that evening but nothing it seemed could chill their enthusiasm. As the results were flashed on the canvass screens by stereopticon machines, the crowd yelled and screamed and roared. When it was announced "Taft carried New York", men throw up their hats, and the "hurrah for Taft" rent the air. Then, "wait," rejoined the Bryan men, "wait, till you hear from the South. Bryan will yet beat Taft to a frazzle." Sometimes, as the results were slow in coming, the people were told on the canvass to "chew Bull Durham tobacco" or "smoke Prince Albert cigars." The crowd, though demonstrative and impetuous, was on the whole orderly. It was exceedingly good-humored, ever ready to laugh and shout at almost anything. The people remained in the streets far into the night. And as they began to drop out toward the small hours of the morning we could still hear the tired cries of—

" 'Ra fr Tat!'"

" 'Ra fr Brine!'"

The Indian Financial Statement.

INTRODUCTORY

[In introducing the Budget for 1912-13 in the Imperial Legislative Council the Hon'ble Sir G. F. Wilson made the following Statements:—]

I HAVE once more to ask for the consideration of this Council while I lay before them my annual review of the finances of India. In pursuance of what is now the established custom, I shall do no more to-day than present the Financial Statement for 1912-13. The discussion upon it will open on Thursday next, and on the 22nd of March I hope to submit the Budget in its final form, while the closing debate will take place, with Your Lordship's permission, on the 25th.

2. It is to-day, as it was a year ago, again my exceeding good fortune to record a period of progress and prosperity. The year which is drawing to a close has been in many ways a memorable year. It will stand out illustrious for the first visit of a King-Emperor to his Indian dominions. It will be remembered for the stately ceremonials of which Their Imperial Majesties were the central figures, and even more for the enthusiastic loyalty and reverence with which they were received by their people. It will be associated with important territorial changes which will lead, we all trust, to greater political content and will strengthen the cause of good government. In all these ways the year will take a memorable place in the history of India. But it has not been without its dramatic interest in realms far removed from political changes or Imperial pageantry. For at one time, during two anxious months, the half of India was on the verge of a drought for which we might have had to go back thirty-four years for a parallel. In the middle of August the outlook was gloomy in the extreme over the greater part of the northern Provinces; and a further suspension of rain would have brought widespread suffering and a serious dislocation of our trade and finance. This catastrophe, however, was averted. Rain came, late but abundant; the area of distress was reduced to narrow limits; and we now cherish every hope of bumper harvests, busy trade and advancing prosperity. The change, as I have said, was dramatic, it was also a striking lesson of how narrow is the line in India between plenty and want, and how incessant is the need for caution in our forecasts and for economy in our expenditure.

REVISED ESTIMATE OF 1911-12

[Dealing first with the season the speaker showed how after a period of gloomy foreboding plentiful rains set in and saved the situation, with the result that the harvests were on the whole good.]

3. The record of our over-sea commerce has thus been an impressive one. The value of our exports is up to date the highest on record. Wheat has not been so big as it was in 1909, or cotton as it was in 1910, or jute as it was in the famous year 1905; but each of them was bigger than in any other year except those which I named, and the cumulative effect was an all-round excess. Moreover, silver was re-exported, chiefly to China, in very large quantities; and the declared value of rice, opium and seeds has been well above the figures of any previous year. Similarly with our imports. They were unusually active in April and May; they eased off in the ensuing four months, as if waiting for the Bêlle Monsoon to disclose its intentions; and there was a striking revival from October onwards. It is piece-goods

and gold that have been the notable features of the year; gold forming one-sixth of our total imports and having reached, during the December quarter alone, the imposing value of 10 crores. Combining both currents of trade, I gave the total value of our private sea-borne commerce for the first nine months of last year as 272 crores, which I said constituted a record. This year the corresponding figure for April to December, 1911, is 304 crores. Even after every allowance for an inflation of prices, which may be in some degree undesirable, this result means busy revenue, a strong exchange, and no small measure of general prosperity.

6. Happily, then there has been justification for the faith in which the Budget for the current year was framed. It was based, as I said a year ago, "on the hypothesis of normal harvests, a good export season, and steady progress in our trade and industries." These hopes have been more than realised. The total revenue of the year, Imperial and Provincial, I budgeted at £78 millions; we now expect to obtain nearly £81½ millions. For the total expenditure, Imperial and Provincial I estimated nearly £79 millions we shall require barely £78 millions, so that we have an aggregate improvement of £4½ millions, of which about £2½ millions belong to the Provincial account. The Imperial surplus will thus be enhanced from just over £½ million to 2½ millions. The greater part of this is contributed by unexpectedly high opium receipts. The balance due to general causes is small, but it is only the residue, as I shall subsequently show, after very large sums have been handed over to the Provincial accounts.

Opium.

7. This leads me at the outset to the well-worn theme of our opium policy and its results. The position when I summarised it a year ago, was one of some difficulty. We had completed the first stage of the period fixed conditionally for the extinction of the trade with China in Indian opium. That period, under the 1907 Agreement, was ten years from the beginning of 1908, but at the end of the first three years we were entitled to ask China if her curtailment of production had kept pace with our reduction of exports; and our future arrangements were to be dependent on the reply. When the time came, however, China was unable to give an authentic answer, and the British officers who were touring the poppy-growing provinces had not yet reported. Out of consideration for China's difficulties we had consented not to press our strict right, and to continue the reduction of our export for another year. In the meantime certain of the Chinese authorities, particularly the Viceroy of Canton, had been imposing disabilities on our trade, which, in our opinion, were clear infractions of the Chefoo Convention; and we were insisting on their removal if our co-operation with China was to continue. Negotiations on these and other outstanding points were in progress when the last Budget was before this Council, and it was obviously impossible to prejudge or anticipate the result by any discussion at the time.

8. On the 8th of last May, the negotiations culminated in an agreement which I may safely describe as satisfactory and honourable to both sides. The agreement is public property, and I need only very briefly recall its leading features, and explain what it means to China and to ourselves respectively.

(i) What was conceded on our side was this. We were to restrict our China exports in 1911 to 30,000

chests, with a progressive reduction thereafter of 5,100 chests a year. But if China can completely eradicate the cultivation of the poppy before 1917, we are to shut down our exports at the same time. In the interval, as each province stops its production and import of native opium, the admission of Indian opium into that province is to cease; the ports of Shanghai and Canton, however, being the last to be closed. Finally, we agreed to a consolidated import duty of Rs. 600 a chest, being a very large increase on the old duties and a welcome addition to the Chinese revenues.

(b) The concessions which China made on her side were these:—An excise tax equivalent to the import duty was to be imposed on native opium. All other taxation and all restrictions (such as those at Canton) on the wholesale trade in our opium were to be withdrawn. Facilities were to be given to our officers to investigate the facts of cultivation, taxation and trade restrictions in the interior.

(c) In a supplement to the Agreement it was settled that though the other Treaty Ports would be closed to it at once, Indian opium not specially certified for China might be admitted into Shanghai and Canton for two months after the date of the Agreement. All opium thus admitted, however, as well as all opium bonded in the Treaty Ports and in stock at Hong Kong for China on the date of the Agreement, would be listed, except so far as it was covered by special certificates from us, and the number of chests thus listed would be taken in reduction of our regular exports during the three years 1912 to 1914. The list, which was not completed till later, showed that the necessary reduction will be 3,820 chests in each of the three years.

Such are the main features of the Agreement which was concluded at Peking on the 8th of last May. The attitude of the Government of India throughout has been absolutely straightforward. We are in full sympathy with the reformation of China; and we are prepared to make, and have made, large sacrifices to help her. But we cannot consent that, under the guise of a reform which may be no reform, revenue should be transferred from India to China without any other benefit to the latter. We unhesitatingly recognised the sincerity of the Chinese Government, but we demanded certain ordinary precautions to insure that our sacrifices shall not be frustrated by reactionary tendencies in the provinces, and we insisted that our trade, so long as it lasts, shall receive equal privileges with the trade in the indigenous drug. This is the spirit in which we pressed the claims of India: and in this spirit the negotiations were carried to a successful conclusion by Sir John Jordan, the British Minister in China. To that distinguished official India is deeply indebted for his care of her interests and for the skill with which he secured a settlement that is sympathetic and just to China and to India alike.

9. Since our Agreement was signed last May, startling events have happened in China. Revolution and civil war have rent the country, and its ancient Monarchy has now been replaced by a Republic. Amid the inevitable confusion, the cause of opium reform has suffered in some measure, though we may hope that the set-back has only been temporary. Cultivation of the poppy has revived in parts of the far interior, where it had been officially extinguished. And some spasmodic attempts have been made at Canton and elsewhere, to infringe the Peking Agreement. But nothing has occurred

which cannot be explained by the suspension of the central Government: and on the whole our compact has stood a severe test remarkably well. We, of course, have carried out our part of it with scrupulous care; and we have done more, for we have gone outside our bargain to help China, as I shall shortly explain.

The operation of the Agreement is automatic, except as regards the special measures for closing down our trade in less than seven years. These hinge upon the provisions of Article III, which will exclude Indian opium from any single province of China and the Treaty Ports therein (Canton and Shanghai always reserved) as soon as there is clear evidence that the province has ceased both to grow the poppy itself and to import native opium from other provinces where it is still produced. It is this provision which I apprehend will be the key to future developments. For the present it has resulted in closing the whole of Manchuria and the provinces of Shansi and Sze-chuan. The two latter had been thoroughly inspected by Sir Alexander Hosie, the British Consul-General, at Tientsin; and similar local enquiries are being extended under that officer's direction, to all the other provinces. The work has involved protracted journeys through the hinterland of China amid conditions of no small physical hardship; and I am glad of this opportunity of acknowledging the great value of the services which Sir Alexander Hosie has thus rendered us.

10. I referred a moment ago to the proofs which we have given China of our goodwill towards her by co-operating in matters which are outside the strict letter of our treaty obligations. The first of these, mentioned in my last Financial Statement, was our decision to " earmark " or certify opium for China from January, 1911. The second was our postponement till the second half of 1911 of our usual monthly sales of opium for other markets than China. By these measures it was our purpose to help China through a critical time. In the early part of 1911 her position was that she could not exclude foreign opium without an international agreement. Meanwhile, prices were bounding up, and it was generally surmised that the closing of her ports was only a matter of time. The inducements were great to pour opium from all quarters into the country before the Agreement could be negotiated, and thus to render nugatory her efforts to effect a direct and progressive reduction of her imports. Our action prevented this. Later, we took a third and even more important step by curtailing the quantity of our opium sold for markets other than China. That step was pressed upon me, in a Resolution which was moved in this Council last March, by my Hon'ble friend, Sir Sassoon David. I was unable to accept his proposal at the time for two reasons: first, because the whole question was under diplomatic discussion at Peking; and second because, we had carefully calculated the requirements of our non-China customers and found them to be well in excess of the 10,000 chests which my Hon'ble friend suggested. After the Peking Agreement was concluded, however, we decided to cut down the 10,000 chests, which we had budgeted to sell, to 14,000; and thereby to reduce the possible margin for smuggling opium without our certificates into China. For 1912 we have brought the figure still lower to 13,200 chests. We doubt if this is sufficient for the legitimate local needs of Singapore and elsewhere. We know that it means an avoidable loss of revenue to us. But against the inconvenience and the sacrifice we have

set our anxiety to prevent the illicit diversion of uncertified opium from less profitable markets into China. There then are our relations with our neighbour in this great and humane reform. She must in the last resort work out her own salvation, but India will assist her by every means in our power and will advance with her, step by step, until the goal is reached.

11. Towards the close of the year a Conference was held at the Hague by the Powers which were represented at the Shanghai International Commission on opium. The ostensible object was to conventionalise the findings of that Commission. To us that particular object was comparatively unimportant, for we have already undertaken all, and more than all, that China asked from us, while our domestic control of the use of opium in India is not a matter in which we require international assistance. We welcomed the Conference, however, from another point of view. It enabled us to lay before the Powers a narrative of the unselfish policy which India has followed. It gave us an opportunity of reviewing and improving our arrangements against the misuse of opium in this country. But above all it justified us in asking for the co-operation of the Powers in checking what, I am convinced, may become a much greater curse than opium has ever been, or is ever likely to be, to India, I refer to the consumption of cocaine and morphia and their respective congeners. The evil done by these drugs is already great, their spread is rapid and insidious, and nothing short of the most drastic State control over their manufacture and sale will stop the growth of a particularly degrading vice. I am happy to say that the Conference accepted this view and that, with the assistance of Sir William Meyer, who most ably represented the interests of India, a convention has been drafted which, if the Powers accept it, will go far to strengthen our hands against this new danger.

12. One word more before I close this account of our opium policy. The poppy growing States of Central India and Malwa are sufferers as well as ourselves from the loss of the China market, and hitherto they have been unable to share with us the temporary compensation of the high prices fetched at the sales of Bengal opium. The whole of the permissible Malwa exports up to the end of 1911 had already been bespoken by advance payment of duty. Some of the Durbars endeavoured to secure a portion of the enormous profits of the trade by imposing extra transit dues; but their efforts were ineffective and lacked combination. It was clearly necessary for us to intervene and we did so from the beginning of 1912. The old pass-duty of Rs. 600 is now doubled; and the privilege of obtaining our certificates for China is exposed to auction. We propose to credit one-half of the extra pass-duty and one-half of the auction fees to the Imperial Exchequer, and to hand over the other half to the States on certain easy conditions and under a formula of distribution which they themselves have agreed upon. We intend also to give the Durbars an opportunity of securing a footing in the non-China markets, which they have made no effort to exploit in the past. For this purpose, 1,000 out of our 13,200 chests will be taken as an experiment from Malwa if arrangements can be made for marketing it and if reasonable prices are offered. In these ways we hope to mitigate to the producing States the blow that must fall upon them sooner or later. We believe that they, in turn, recognise the generosity of our intentions.

13. There are three special reasons why I have dwelt at what may seem to be inordinate length on this dull subject. First, the future of our opium revenue has been made clearer by the Agreement of last May, and a lengthy pronouncement of policy may not again be necessary. Second, I wished the Council to see that our attitude has not been vicarious righteousness on the one hand, or selfish obstruction on the other. We have made real and lasting sacrifices and manifested a practical faith in China's capacity for regeneration. Lastly, I desired to show that we have not ignored the legitimate claims of our merchants or the interests of the Malwa States. With these explanations, I turn now to the financial outcome of our policy. In 1911 we sold 15,440 Bengal chests and exported 15,576 Malwa chests with certificates for China. We also sold 14,000 Bengal chests for other markets. Speculation was active throughout the year and reached its zenith in October, when the China drug rose to the phenomenal price of Rs. 5,600 a chest. Then came the revolution and prices dropped, but they are still over Rs. 4,000, while the curtailment of the Singapore sales has kept that section of the market strong. In 1912 we propose to sell 6,500 Bengal and export 14,560 Malwa chests for China, as well as 13,200 chests (of which 1,000 at the outside will come from Malwa) for other markets. The first two months of our new Bombay system of auctions have been satisfactory; the average yield (including pass-duty) having been close on Rs. 3,000, of which we take Rs. 1,800 and the Durbars the remainder. In the current financial year, the net result is that Bengal opium is now expected to realise £1,241,000 and Malwa opium £331,000 more than I budgeted for.

14. The true measure of this remarkable windfall is obtained by comparing our actual receipts with what we should have obtained under the sliding scale which, as I explained last year, we treat as the gauge of normal conditions. The sliding scale figure for the year is 615 lakhs; our anticipated receipts are 878 lakhs. The excess is £1,757,000, which we propose to use on precisely similar lines to the windfall which it was my good fortune to announce a year ago. Two thirds of the amount will be remitted to London for the redemption of temporary sterling debt. The remaining third, or in round figures £566,000 (£5 lakhs), will be distributed in grants for non-recurring expenditure of a beneficial character. Our precise disposition is briefly as follows:—

£333,000 among the Provinces for sanitation,

£133,000 among the Provinces for agricultural improvements and similar purposes;

£10,000 to the Central Research Institute for work in public hygiene;

£33,000 towards the establishment of a School of Tropical Medicine in Calcutta; and

£27,000 for Government laboratories in Burma and at Farel (Bombay).

Last year the bulk of our opium windfall was earmarked for education; this year it goes to the sister grace of cleanliness. The details will be found in the explanatory memorandum attached to this statement; and I have no doubt that my Honble colleague, Sir Harcourt Butler, will explain next week the objects which these grants are intended to further.

Ordinary Revenue.

15. I am able at last to turn from the story of opium and its troubles to the ordinary business of the closing year. As I mentioned, we expect the total revenue including that of the Provinces, as well as our own, to be nearly 3½ millions better than my original estimate. Of this improvement £3,400,000—or practically the whole—is Imperial in its origin. The fact is disguised, as I shall shortly explain, by large transfers of revenue from the Imperial to the Provincial exchequers; but to get a clear view of the position, we must for the moment neglect these transfers. Of the true Imperial betterment then, close on £1,600,000 is accounted for by the high prices of opium, and £1,800,000 by the general increase in the prosperity and trade of the country.

16. The main contribution to this great advance comes again from our State Railways. Every one of our main lines has shared in the improvement. Wheat, cotton, jute, coal and oil-seeds swelled the returns; the passenger traffic has grown exceedingly; and the extra business brought by the Royal visit has outrun our expectations. The total earnings for the year are now expected to be £1,587,000 above our budget, and the highest on record. This growth of receipts has meant, of course, extra expenditure in working the traffic, and extra payments in profits to the Companies which lease our lines; so that the increase in net revenue is £1,185,000. Closely associated with our Railway figures, as they must always be, are our Customs returns, which promise an increase of £330,000 over our budget estimate. For this we have to thank petroleum, piece-goods and rice; petroleum imports having been stimulated by a rate war among the great oil Syndicates; piece-goods being always an active market in prosperous years, and the export of rice being in abnormal demand to meet a shortage in the Far East. To enumerate all the other heads of revenue which have contributed to our surplus would take more time than I can spare. The chief of them are Interest, with an excess of £237,000 earned almost entirely on the high balances in our Home treasury; Mint where, owing mainly to the demand for British dollars in consequence of the troubles in China, our receipts have risen by £143,000; and Exchange, which was strong throughout the year and has brought us an additional £106,000. I am glad to see that the consumption of Salt, and with it our revenue, have begun to move again after a long period of stagnation. There was some holding up of stocks before the Durbar in the hope of a reduction in the duty; but a brisk business is now being done, and, in spite of the growing popularity of credit sales in Bengal, the revenue is expected to be £63,000 higher than our estimate.

17. The one and only budget head that has disappointed us is Land Revenue, where our figures faithfully reflect the distress in parts of Bombay, and the failure of the early autumn crops in certain areas of the Punjab and the United Provinces. The sale of proprietary rights in the canal colonies of the Punjab has also advanced more slowly than seemed probable a year ago. The deficiency from the budget, for the head as a whole is £260,000, of which approximately a half would be the Imperial loss.

The marked improvement in our resources, however, has enabled the Government of India, with the concurrence of the Secretary of State, to make a number of

important grants to the Provinces; and this pleasing operation takes the technical form of increasing the Provincial shares, *pro tanto* diminishing the Imperial share of the land revenue receipts. It will thus be found that, in place of a drop of about half a million, our figured tables show an apparent deterioration of nearly £1,600,000 from the budget estimate of our Imperial income from this source; while the Provinces, instead of being about half a million to the bad, are shown as being £1,630,000 to the good.

18. The grants which we have thus made out of our abounding good fortune cover a large field. I have already mentioned the £500,000 allotted from the excess opium receipts. Of those which are taken from our general resources I need enumerate only the more important, referring my Hon'ble friends to the explanatory memorandum for greater detail:

£82,000 in connection with the re-constitution of Bengal and Assam;

£212,000 for the cost of the Royal bonus of half a month's pay to Provincial officers in civil employ;

£72,000 for the remission of famine debts in Kathiawar, as announced at the Delhi Durbar;

£157,000 to the Madras Corporation in aid of its waterworks and drainage scheme;

£133,000 to Burma for the improvement of communications;

£58,000 for special Provincial expenditure in Assam and Burma on the expeditions upon the North-East Frontier.

The first of these grants represents the cost of providing suitable opening balances for the three new Provinces of Bengal, Assam and Behar and Orissa. The other grants explain themselves. They are all non-recurring.

Ordinary Expenditure.

19. The expenditure of the year is less by £843,000 than we provided for in the budget. £225,000 of this occurs in the Provincial account, mainly as a consequence of the inability of the local Governments to spend in full their grants for education and sanitation. The Imperial savings come to £618,000, which may be taken as appearing almost wholly under two heads—the Royal Visit and the Opium Department in Bengal. Apart from these, there has been an increase of about £100,000 in Military expenditure, which will be explained later. On the other hand, the £120,000 which was allotted under a new head for Protective Irrigation has not been utilised—a disappointing result in view of the importance of these works. In other respects our estimate of expenditure was a very close one, and there are no material departures from it. The non-recurring expenditure on the Royal bonus, in so far as it falls into this year's expenditure accounts, was met without difficulty by savings in other directions.

20. The opium charges require a few words of special notice. China's zeal for reform and our pledges of assistance mean a large and, we must assume, a progressive reduction in our output of Bengal opium. To keep abreast of this, we have closed down the Patna factory and abolished the appointment of Opium Agent for Behar. We have focussed the administration in one Agent, and the manufacture in one factory, at Ghazipur.

We have also concentrated the area of licensed cultivation, giving up Bihar entirely, as well as a number of the outlying districts in the United Provinces. How drastic the reduction has been, may be judged from the fact that in 1901-02, the last year before we began to curtail our exports, the area under poppy was 200,000 bighas; in the current season it is only 25,000 bighas. Recruiting for the department has, of course, been stopped for several years but the sharp restriction of area in the present year, with the closing of one factory and a number of sub-agencies, has necessitated some retrenchment in establishments. I should like to explain how this is being carried out. I should like also to express the sympathy of the Government of India with a body of deserving officials for whom the outlook for some time past must have been full of uncertainty and gloom. What we are doing is, first, to get rid of the least efficient of the opium employees on such pensions or gratuities as the rules permit; second, to transfer to other departments all who are fit for a new class of employment; and third, to encourage the retirement of the senior men by offering full pensions to all those who are within five years of completing their qualifying service. On these lines we are dealing with every rank from the highest paid departmental officer down to the humble peon, and we hope to prevent any genuine hardship. The notices of discharge which were served on a number of the Gazetted officers have been withdrawn; several of the younger men have been provided by the United Provinces Government with posts in the Provincial Civil Service, the claims of others are still being pressed in different offices, and any who are ultimately redundant will be retained as supernumeraries until we can absorb them or find other employment. When the department has been lightened in this way, and by the acceptance of the special pensions which we are offering, we trust—though, of course, we cannot promise—that it will be put on a footing which will make further retrenchments unnecessary. The area of cultivation is now as low as it need be for several years; and any future reductions will probably be no more than parallel with the normal decrement of an establishment for which there is no recruitment.

To come back to the present, however, the Council will perceive a saving of £445,000 in opium charges. This is due in part to the economies in administration which I have just mentioned, but in the main to the abnormally thin yield of the last poppy harvest. The consistance was poor, and our payments were correspondingly low.

Expenditure on the Royal Visit.

21. I now, My Lord, wish to describe briefly, and of necessity in somewhat general terms the expenditure incurred on the Imperial Durbar at Delhi and on the other incidents connected with the visit of the King-Emperor and Queen-Empress to India. Our accounts have not yet been closed or compiled, and considerable alterations in detail may still have to be made. But, looking back to the cordiality and even the enthusiasm with which this Council applauded the provision entered for the Royal visit in my last budget, I consider myself bound in courtesy to take this, the first available opportunity of laying before them the manner in which that provision has been used. It will be remembered that the total allotment for the Royal visit was £1 million sterling. It was necessarily a very rough forecast, as

we had no estimates to go upon at that early date; but our feeling was that it would enable Their Imperial Majesties to be received and entertained in a manner suitable to the wishes of their Indian subjects. One-third of this million was to be military expenditure; and the remainder appeared in the civil estimates, with a small deduction for recoveries from the sale of tents and other equipment. The total net provision for Imperial Civil charges, including a small advance grant in 1914-15, was £633,000. The actual net expenditure against this grant, so far as we can at present estimate, may be tabulated as follows:—

(a) On the Durbar at Delhi:—	£
Administrative charges	62,100
General services, roads, lighting, water supply, sanitation, etc.	180,100
State Ceremonies	58,300
Sports, garden party, fireworks, music, etc.	20,000
King-Emperor's Camp	16,000
Camps of the Government of India, Foreign Department, Commander-in-Chief, Political and other Imperial officers	115,600
Visitors, Press and Police camps, etc.	60,300
Miscellaneous	12,300
Less recoveries	145,800
Total £	420,800
(b) On the Royal tour	48,300
(c) On Medals and other incidental charges	13,300
Total £	482,400

We have still to meet the cost of an addition to the regalia. Allowing for this and leaving a small margin for charges which have not yet come in, we may take the net expenditure at £560,000.

The allotment provided in the Military budget was £333,000 which was intended to cover a very large concentration of troops at Delhi. When the failure of the early rains in Northern India induced difficulties about food supplies and forage, the Military programme was reviewed and the number of troops under orders for Delhi was materially reduced. The actual estimated expenditure has been only £207,000. It will, I am sure, be no small gratification to this Council that the reception of Their Imperial Majesties was carried out on a scale worthy of the occasion and yet with a regard for economy which has left us so well within the funds allotted for the purpose.

22. The expenditure from Provincial revenues on the Royal visit had not been the subject of any reasoned estimate when the budgets of the various local Governments were framed in the opening months of 1911. It was worked out, however, during the hot weather in the closest consultation with the Government of India, and we have now got provisional accounts. It is estimated that the eight major Provinces spent £173,000 on their camps at Delhi, and about £72,000 on local celebrations, illuminations, etc.

23. Such, then, so far as we can judge from our unfinished accounts, were the charges for the reception and entertainment of Their Imperial Majesties. But the Council will probably expect me to narrate also the cost of the Royal bonus and the various minor bonus which were announced by Your Excellency on behalf of the King-Emperor at Delhi. For these, of course, there

could, in the nature of things, be no budget provision; and some of them actual expenditure or loss of revenue which will not be brought into our accounts for some time to come. The only boon of any importance for which I have a reasonably complete estimate is the bonus of a half month's pay to certain civil employees and to the Army in India. The whole of this will be met from Imperial revenues; and we believe that it will cost about £325,000 in the Civil accounts and about £160,000 in the Military accounts, or a little under £500,000 in all. The remission of debts in certain Native States means a loss of nearly £85,000; and the monetary effects of the other boons (apart always from the grant for Education) is inconsiderable. I believe, therefore, that I should be safe in putting the total figure at £600,000 at the outside.

BUDGET ESTIMATE FOR 1912-13.

21. I now leave the eventful year which closes with this month, and open my budget for 1912-13. There is no one who realises more keenly than I do the dangers of prophecy in India; but the budget forecast must inevitably involve some element of prophecy. All that I can say is that our prospects to-day are excellent, and that we have every hope that the brightness of the outlook will continue. I propose, then, avoiding unreasoning optimism on the one hand, and holding fast to my faith in the progress of India on the other, to estimate again for a year of normal seasons and trade. There still hang over us the uncertainties of the opium revenue, and there are as there always will be, special claims of an urgent nature upon our exchequer. But with care and economy we shall be able, during the coming year at least, to discount the former and to satisfy the latter without any addition to the burden of our taxation. On the other hand, our position is not one which justifies any important remission of taxes. I present to-day, therefore, what I may call a "No Change" budget. My estimate is that the revenue and expenditure, Imperial and Provincial, will balance almost exactly at £79½ millions. In the purely Imperial section of the accounts, however, there will be a surplus of approximately £1½ millions, which it is proposed, for reasons that I will touch upon later, to retain unimpaired.

Revenue.

25. If we set aside Opium the total revenue, Imperial and Provincial, for which I budget is almost the same as in the current year. We expect an improvement in the Land Revenue collections and in those other classes of receipts which respond most directly to favourable agricultural conditions. On the other hand, I have taken a somewhat conservative estimate of Railway and Customs revenue, while we cannot count upon a continuance of this year's high receipts from Mint and Interest. The net result, as I have said, is practical equilibrium. But in the Imperial section of the accounts with which we are at present more immediately concerned, the position is one of considerable strength, seeing that we have not to repeat the large non-recurring grants to the Provinces which diminish our share of the land revenue receipts in the current year. Apart from opium, which, as usual, throws the comparison out of gear, the Imperial revenue which we hope to obtain next year will be £920,000 in excess of our estimated receipts in 1911-12. I shall dispose of opium first, and then discuss this figure in some detail.

26. The consequences of the new Agreement with China are written large across our estimate of opium revenue. The number of chests which we may sell with China certificates in 1913 is limited to 16,380, of which we are under a promise to offer 14,660 to Malwa. Our China sales for each calendar year will now, in all probability, be held from January to October in Calcutta, and in Bombay from the preceding November to August. Our uncertified exports will amount to 13,200 chests, of which we shall give Malwa a chance of taking 1,000 chests; and the sales will be spread over all the months in the year. I shall spare the Council the reasons for these divergencies in procedure, which are intended to secure the maximum of revenue with the minimum of inconvenience to the trade. I shall also spare my Hon'ble friends the puzzling calculations which are needed to fit these arrangements into the mould of the financial year, and will merely say that it is proposed to sell altogether 19,821 chests for China in 1912-13, which with the 13,200 chests for other markets, gives roughly 33,000 chests in all. As compared with the much larger quantity on which we have been paid in the current year, this in itself suggests a considerable fall in revenue. But I have not ventured to budget for the same high prices as we are now receiving. With the restoration of settled government in China, we may look for the revival of more rigorous measures against the opium habit, and these are likely in turn to affect the tone of the market for our exports. In any case prudence forbids us to attempt to follow the vagaries of a highly speculative market. Between a falling output, therefore, and a cautious forecast of prices, my total estimate of opium revenue for next year is £2,235,000 below what we expect to obtain in the current year. The actual figure is Rs. 613 lakhs, which happens to be almost identical with the figure (Rs. 610 lakhs) for 1912-13 on our theoretical sliding scale. If prices should outrun our calculations I have little doubt that we shall find useful employment for the money.

27. The improvement in our Imperial receipts from general sources is of a negative character, being entirely due to the smaller volume of special grants to local Governments. In other respects we do not look forward to the same high revenue returns as in the current year. Under Railways in particular I have thought it wise to assume some slight relaxation after the rich harvest of the Durbar year. It is not only that we shall have no Royal visit; but so much depends on trade conditions which it is impossible to forecast, and I think a moderate margin of safety should offend no prudent publicist. I have accordingly taken the net earnings of our State railways at £601,000 less than in the present year. Similarly with Customs. If the almost feverish activity of the trade in rice, silver and petroleum were to continue, our Customs receipts would probably touch the imposing figure of 10 crores. But all booms have their day, and we have made a deliberately moderate estimate for these commodities; the net result is a reduction of £146,000 from this year's receipts. Three other heads of Imperial revenue yield somewhat fortuitous contributions to the decline. Interest is worse by £192,000, because the balances in our Home treasury are being materially reduced; Mint by £135,000, because we do not expect the same demand for dollars from China; and Exchange by £100,000 for the technical reason that we always budget for our exchange transactions at par.

In the classes of revenue which are more closely associated with the internal prosperity of the country, we anticipate no set back. Now that the Salt revenue is moving, we except that it will rise by another £31,000. From Stamps an improvement of £71,000 is probable; and a still larger increase would have been taken for Excise if it had not been obscured by the complete provincialisation of that source of revenue in Bengal. The chief advance, however, is under Land Revenue, where the return of normal conditions in the areas that suffered from the irregularities of the last monsoon will, we trust, be the main contributor to an increase of which the Imperial share should be something in excess of £109,000.

23. This brings me to the dominant factor in the whole comparison—the provincial grants which appear as land revenue assignments, and the reduction in which will push up our apparent Imperial receipts. The details are complicated and can better be set out in the explanatory memorandum. But their net effect is that we are saved the non-recurring grants of roughly £2 millions which signalise the current year, and that we propose, as I shall explain later, new recurring grants of about £1 million in the coming year. There is thus an addition of £1½ millions to the Imperial share of the land revenue, over and above the £100,000 which comes to us from improved collections.

Expenditure

24. The position in regard to expenditure is fortunately simple, and not unsatisfactory. Imperial and Provincial charges together, the total provision for next year is nearly £½ millions higher than the estimated expenditure of 1911-12. The whole of this excess, however, occurs in the provinces, and by far the major part of it represents drafts on the large Imperial subsidies for education, sanitation and other beneficial services which are being placed at the credit of local Governments. When we turn to the estimate of Imperial expenditure, we find that there is an actual decrease, the total being £73,000 less than in the current year. The chief factors in this result are the following. Our interest liabilities show a growth of £2,77,000 more as we must always do, with the growth of our borrowings, and also in a minor degree with the expansion of our provident funds, Savings Bank deposits and the like. Our Railway revenue charges, apart from interest on the regular railway debt, are also higher by £97,000. But the only other large excess over the grants in the current year appears under Education and represents a special reserve of £50,000 for the advancement of this great service. Otherwise the spending departments have shown much restraint, and there is little or no general rise in administrative charges. On the other hand there is a noteworthy drop of £511,000 in military expenditure, to which I shall refer later; and as if to make room for the new education expenditure we have a reduction of £180,000 under the head where the outlay on the Royal visit is recorded in the current year.

25. With the substantial improvement in our general revenue and the curtailment in expenditure, it was obvious that we were in sight of a large surplus. It was decided therefore to take an important step forward in the path of educational reform. The King Emperor had announced at Delhi a permanent grant of 50 lakhs (£533,000) for the furtherance of truly popular education. We decided to add another recurring £67,000 to

the Royal boon, and to supplement it by a further but non-recurring grant of £133,000. The total new provision for the year has thus been raised to the handsome figure of 12½ lakhs, or more than the whole amount which we spent this year in connection with the Royal visit and the Delhi Durbar. I will leave it to my Hon'ble friend in charge of the Education Department to describe how the money is to be employed, and I confine myself to explaining where it is to be found in the estimates. £300,000 of the recurring grant has been transferred, through the usual method of Land Revenue assignments to the provinces which have regular financial settlements, and £3,000 to the North-West Frontier Province. The remaining £97,000 recurring and the whole of the £433,000 non-recurring have been entered, for the present, as an Imperial reserve under the Education head, for distribution at more leisure.

31. There are two other small matters which we have taken the opportunity of disposing of. One is the provision of a small reserve (£15,300) for strengthening the sanitary services in India in accordance with a scheme which is now before the Secretary of State. The other is the abolition of the last of the petty cesses upon the land against which my predecessor waged incessant war. The cess in question is the village service cess in proprietary estates in Madras, and as I have explained more than once, the reasons why we have not hitherto taken up the question are first, because we had no money and second, because we could not remit the cess before it was imposed. The levy of the cess is now being extended as the old service tenures are being resumed; and it is estimated that its relinquishment will cost Imperial revenues £17,000 next year, rising gradually until the proprietary estates are wholly relieved. The rent of the tenures will be credited as Land Revenue, of which the province will receive a moiety. The province will pay the salaries of the village servants, and the net loss to provincial revenues will be made good by Imperial assignments.

Debt Expenditure.

32. No narrative of next year's programme of expenditure would be complete without a reference to the momentous project which lies before us in the construction of the new Imperial Capital of India at Delhi. I may say at once that we are not yet in the possession of any estimates of its cost. Plans for the temporary housing of the Government of India headquarters are under preparation; but no plans for the permanent Imperial City are to be thought of until the best available experts have studied and advised upon the project in all its bearings. Meanwhile, my immediate duty has been to devise a scheme for financing the work, a scheme which will be as little onerous as possible to the taxpayers of India. Three possible alternatives have presented themselves throughout. The first, and in some ways the most attractive, would be a special Delhi loan. The second would be to charge the whole expenditure, as it occurs, against current revenue. The third would be to put the Delhi works on precisely the same footing as our large railway and irrigation works, treating them as capital expenditure and financing them partly from loans and partly from whatever spare revenues remain in each year after meeting our ordinary administrative needs. I shall not weary the Council by the various considerations which decided us, with the full approval of the

Secretary of State, to adopt the third of these courses. It will, I believe, commend itself to the financial and commercial community of India. By treating the Delhi operations as ordinary Capital works, we ensure the greatest possible elasticity in the provision of funds; we avoid unnecessary additions to our unproductive debt; and I hope we allay the fear—so far as I am concerned, a baseless fear—that the new city will be built from the produce of fresh taxation.

33. Our programme then is this. So long as large sums of money are wanted for Delhi, we shall raise as much as we can along with our ordinary rupee loans, being guided in the amount of our borrowing by the state of the money market rather than by the precise estimate of expenditure for the year. If money is easy and we can obtain more than we immediately require, it will lie in our cash balances available for future use. Meanwhile, as we shall now have three sections in our annual Capital programme instead of two, we may reasonably enlarge the conventional figure of one crore which we have hitherto endeavoured to secure as our revenue surplus. There is no need to fix any standard surplus; much will depend on the circumstances of the year and on the other interests concerned; but whenever we find ourselves able to budget for a larger surplus than £667,000 without detriment to the other claims upon us, we shall do so until the financing of the new Delhi is completed. It is on these lines that we are budgeting for 1912-13. We propose to raise a rupee loan of 3 crores, the whole of which, so far as we can at present judge, will be available for Delhi, and we leave our surplus at the unusually high figure of £1½ millions, out of which at least one crore can be used for Delhi. Our estimate of what we shall need for actual expenditure within the year is two crores, shown under a new Capital head which will be observed in the tabular statements. Whatever part of our total provision is not required will remain in our general balances for future use. The current administrative charges of the Imperial area, as opposed to the initial outlay, will of course, be taken in the ordinary revenue account, and we have entered a lump provision of £33,000 in the 1912-13 Budget for that purpose.

RECENT INDIAN FINANCE.—By Mr. Dinshaw Edulji Wacha. A valuable collection of papers relating to India Finance dealing with such subjects as, The Case for Indian Reform; The Growth of expenditure; Enhanced Taxation; Revenue and Expenditure; Reasons for the Deficit, etc. Price Rs. 4.

INDIAN MILITARY EXPENDITURE.—An Exhaustive and Comprehensive treatment of the question. Full of facts and figures by Mr. Dinshaw Edulji Wacha, Crown 8vo. 54 pages, Rs. 4.

INDIAN RAILWAY FINANCE—By Dinshaw Edulji Wacha. Price Rs. 4.

GOKHALE'S SPEECHES.—An exhaustive and comprehensive collection of his speeches, with a biographical sketch and a portrait. Over 1,000 pages. Crown 8vo Price Rs. 3. To Subscribers of the "Review," Rs. 2-8.

G. A. Natesan & Co., Sankurama Chetty Street, Madras.

MILITARY SERVICES

31. Under Military Services the expenditure for five years is shown in the following table—

NET.	All Military heads.	£	1908-1909	1909-1910	1910-1911	1911-1912 (Budget)	1911-1912 (Revised)	1912-1913 (Budget)
GROSS.	Total.	£	20,650,622	20,519,284	20,485,339	20,823,200	20,923,800	20,412,500
	Special Defences.	£	29,044	29,004	7,087	6,900	7,000	20,200
	Military Works.	£	907,302	888,342	892,705	924,400	889,200	860,600
	Manne.	£	470,997	461,167	445,887	447,300	455,200	447,100
	Army.	£	19,177,303	18,901,181	19,131,780	19,444,600	19,572,400	19,084,700

33. In our Army estimates for the current year we provided £½ million for Coronation expenditure. This grant was designed to cover the military cost of the Delhi Durbar and of the general manoeuvres by which the assembly at Delhi was to be proceeded, as well as other military charges connected with Their Imperial Majesties' visit to India, such as expenditure on escorts at Bombay and Calcutta, and also to provide for the despatch of a contingent to England to represent the Army in India at Their Imperial Majesties' Coronation at home. But the unfavourable outlook in the early monsoon period made it necessary to recast the original programme. It was decided to abandon the intended manoeuvres altogether, to reduce the number of troops to be concentrated at Delhi, and in the interests of the civil population, to rail all troops except those in the immediate neighbourhood. Notwithstanding this modification of the original programme, the numbers brought to Delhi eventually reached the high total of 57,000 soldiers, 18,000 followers and over 20,000 animals. The total expenditure on the reduced scale was finally estimated at £203,700, and it appears that this estimate will be very closely adhered to. The military accounts of the

Darbar and other services connected with the Royal visit and coronation are rapidly approaching completion; and the latest forecast of the accounts authorities indicates a probable outlay of £161,500 (less receipts amounting to £3,500) in connection with the concentration at Delhi, while the total of other expenditure connected with the Royal visit is put at £27,300 and the cost of the Home Coronation contingent at £18,300. These figures do not include the bonus of half a month's pay which was issued to the military services in common with the civil departments, and for which no provision could, of course, be made in the original Budget. This concession costs the Army £165,700.

30. The excess outlay thus entailed and the cost of the Aber Expedition together with the friendly mission to the Afghani country (£124,300) may be regarded as met from the *lapses* which occurred in the schedule provision, owing to delay in the prosecution of various schemes of which the most important were those of artillery re-armament and line rebuilding. As regards the ordinary charges, the Budget provision was fully utilised and some additional grants were made in view of the improved receipts, with the result that the year is expected to close with a small net excess of £11,500.

31. It should be noticed that in both the present and the coming year there is a heavy bill for special services. Apart from the Delhi Darbar and the Aber Expedition already mentioned the arms traffic operations were continued at a cost of £118,000, the total expenditure from the outset up to the end of the current year being thus raised to £340,300 and the Indian Government had also to meet a share (£17,000) of the cost of sending a regiment to strengthen the consular guards in Southern Persia. In the coming year it is estimated that the winding up of the Aber operations will involve an outlay of £35,700. The provision of £153,500 for the continuance of the arms traffic operations is repeated, and £11,200 is provided towards the additional cost of the consular guards. On the other hand, a windfall of £76,700 is anticipated from the absence of certain troops in China.

32. Apart from these special services, the budget of 1912-13, has been mainly influenced by the enquiry into the possibilities of retrenchment which was promised a year ago. The schedule grant has been reduced by £75,200, as compared with the figure adopted in the current year, and its application will be limited almost exclusively to the provision of primary requirements of the Army such as guns, rifles, bayonets, and swords, and to the prosecution of the scheme for providing Indian troops with sound and well-constructed lines, and the continuance of other military works now in progress. In pursuance of the same policy, expenditure has been temporarily curtailed in various directions, and a number of permanent economies effected, while other important suggestions are still under consideration. This investigation will not be concluded until the Government of India and the Secretary of State have received and dealt with the reports of Field Marshal Sir William Nicholson's Committee which will enquire into army expenditure during the coming autumn, and Admiral Sir Edmund Slade's Committee, which has just completed its examination of marine expenditure. Meanwhile the effect has been to curtail expenditure, whether temporarily or permanently by a sum of £191,200, of which the Budget for the coming year takes account. We are also relieved by the disappearance of the provision for Coronation Darbar expenditure; and

though in some directions and especially in regard to the food charges and the provision of stores, some additional outlay was to be faced, the final result is a reduction of the net military Budget by £190,700 which brings down the total net figure, namely £19,091,500 to an amount lower than that of any year since 1903-04.

RAILWAYS.

33. In accordance with the usual practice, I have had the figures of capital expenditure on railways during the last five years brought together, and compared with the similar estimate for 1912-13. The table includes all capital outlay, whether incurred by the State or through the agency of guaranteed or assisted companies.

	1912-1913 (Budget)	£	0,341,200	2,472,800	80,000	9,090,000
	1911-1912 (Revised)	£	5,217,499	2,638,000	285,000	8,116,400
	1910-1911	£	5,092,813	2,055,261	387,221	7,445,293
	1909-1910	£	6,532,441	1,482,962	393,201	8,204,204
	1908-1909	£	8,352,741	1,266,200	144,130	10,045,071
	1907-1908	£	7,329,000	3,096,800	...	10,325,800
Open lines including rolling stock ...						
Lines under construction—						
(a) Started in previous years ...						
(b) Started in current year ...						

40. On the 31st March, 1911, the total length of open lines was 32,308.21 miles, classified according to gauge as follows:—

3-ft. 6-in.	16,748.03
Meters (3 ft. 3½ in.)	13,633.28
Special gauges (2 ft. 6-in. and 2 ft.)	2,027.49
Total	34,408.80

During the current year we have added to these approximately the following mileage:—

5-ft. 6-in.	...	322 30
Metre (3-ft. 3½-in.)	...	308 91
Special gauges (2-ft. 6-in. and 2-ft.)	...	70 11

Total ... 701 32

During the ensuing year it is intended to increase this length by 750 55 miles.

41. In the current year the return on the capital at charge amounts to 4.99 per cent. as compared with 4.66 in 1910-11, 4.48 in 1909-10 and 3.69 in 1908-09. The rate of interest which we have taken for the year on the debt chargeable to railways is the 3.377 per cent.

The current year has been more favourable than last year, and the traffic returns show that there will be a large improvement over the Budget Estimates. The improvement is largely due to general development of Traffic on railways and to additional traffic in connection with His Majesty's visit to India and the Delhi

Durbar. The grants for working expenses are likely to be larger than the Budget Estimate by £346,700.

If we take the Railway Revenue Account as a whole and set the interest charges, the annuities and Sinking Fund payments and the minor debits (cost of land, etc.) against the net earnings, we find a surplus of £2,989,300, which accrues to general revenue against a net gain of £2,017,500 in 1910-11.

42. In the Budget Estimate of next year provision has been made for a decrease in the gross receipts compared with the current year, for reasons to which I have already alluded. The latter includes an extra day's earnings in February, and special traffic in connection with the Royal visit and Delhi Durbar. Provision for working expenses has also been put a little higher on account of necessary renewals of permanent-way, rolling stock and strengthening of bridges. It is expected that the net surplus, after providing for interest charges, which show an increase on account of growth of capital, will be £2,021,900.

IRRIGATION.

43. The financial position of our great irrigation undertakings may be gathered at a glance from the following table, which carries on and brings up to date the information that it has been customary to give in previous Financial Statements:—

Particulars.	1908-1909.	1909-1910	1910-1911.	1911-1912 Revised.	1912-1913 Budget.
Productive Works.	£	£	£	£	£
Capital outlay to end of year	28,002,898	29,145,111	30,355,971	31,063,000	33,380,800
Direct receipts	2,213,644	2,249,011	2,236,989	2,314,300	2,223,700
Land Revenue due to Irrigation	1,084,773	1,111,158	1,170,065	1,362,100	1,375,200
Total Receipts	3,298,417	3,360,169	3,407,054	3,676,400	3,600,900
Working Expenses	1,011,140	1,005,481	1,080,404	1,096,000	1,050,000
Interest on debt	930,708	960,829	1,001,680	1,051,700	1,104,000
Total Working Expenses	1,941,848	2,026,310	2,085,084	2,147,700	2,154,000
Net Profit	1,356,569	1,333,859	1,321,970	1,528,700	1,446,900
Protective Works.					
Capital outlay to end of year	2,736,094	3,112,121	3,144,204	3,814,200	4,291,000
Direct receipts	33,080	58,006	51,061	57,900	68,800
Land Revenue due to irrigation	6,271	6,236	7,940	9,100	9,100
Total Receipts	40,251	64,296	59,001	67,000	78,900
Working Expenses	25,419	28,730	29,217	42,700	55,900
Interest on debt	86,619	97,882	110,730	122,600	130,900
Total Working Expenses	112,038	126,612	139,947	165,300	192,500
Net Loss	71,817	62,316	80,946	98,300	116,900
Minor Works and Navigation.					
Direct receipts	219,334	235,691	228,463	243,400	244,300
Expenditure	879,339	889,433	877,728	818,400	909,500
Net Loss	660,005	653,741	649,265	605,000	665,000

44. On the 31st March, 1911, 68,251 miles of main and branch canals and distributaries had been constructed, commanding 48 million acres of cultivable land, the area irrigated in 1910-11 being about 22 million acres. The productive works during that year yielded a net return of 700 per cent. on the capital outlay of £30 millions after paying all charges exclusive of interest. The net profit to the State was £1,522,000.

45. The revised estimate for 1911-12 shows a net profit of £1,529,000 on productive works and a net return of 807 per cent on the capital outlay of £32 millions. Excluding works still under construction the net return on the balance of the capital extended (£28 millions) amounts to 978 per cent.

46. On the 31st March, 1912, we expect to have 68,684 miles of main and branch canals and distributaries constructed to command 48,734,000 acres of cultivable land. It is expected that an area of nearly 22½ million acres will be irrigated during the year. In addition to the canals in operation, there are altogether 55 projects which are either under construction, awaiting sanction or being examined by the professional advisers of the Government. Of these 26 are productive, 23 protective and 6 minor works. The two former are designed to irrigate 880 and 118 million acres, respectively, at a total capital cost of about £31 millions and £64 millions respectively. The productive works are expected to yield a net return of 728 per cent on the outlay.

47. Of the projects referred to in paragraph 46 of the last year's Financial Statement the Chaggar, Twante, Mahanadi and Wanganga Canals were sanctioned during the year. The other three schemes, viz., the Cauvery Reservoir Project, the Sukkur Barrage and the Kohri Left Bank canal are still under the consideration of the Government of India. Another most important scheme which is now before the Government of India is the Sarda Ganges-Jumna Feeder project, mentioned in paragraph 63 of the Financial Statement for 1900-10. This work is estimated to irrigate 1,028,400 acres situated in two provinces, twenty five districts and three Native States. An estimate for providing permanent Head Works for the Upper Ganges canal, amounting to nearly Rs. 26 lakhs, is about to be submitted to the Secretary of State for sanction. This work will serve to render the water supplies of the Upper Ganges and Agra canals more assured during critical times. Satisfactory progress continues to be made in the construction of the triple canals in the Punjab. The probable dates of opening of the three canals are as follows:—

Upper Chenab canal—May or at latest October, 1912.
Upper Jhelum and Lower Bari Doab—1914.

The works on the Upper Swat River canal in the North West Frontier Province are now about half finished and are proceeding satisfactorily.

PROVINCIAL FINANCE.

48. In saying a few words on the Provincial finances I have no intention to try the patience of the Council with a disquisition such as it was necessary to impose upon them a year ago. The scheme of permanent financial settlements, which I then described, is still in its infancy, though it could not have had a much better start than the current year has given it. The only Province that has caused us any anxiety is Burma, where the revenue has been disappointing and the turn of the tide has not yet come. In order to prevent either a large overdraft, which under our new arrangements is inadmissible, or practically a complete suspension of its

public works, we have made the Province a special gift of £133,000, to be spent on the improvement of its communications. The other provinces have all fared extremely well, and I have every hope that the permanence of their settlements will strengthen the spirit of economy and self reliance in the Provincial administrations, while leaving them ample margin for all legitimate expansion.

49. The even tenor of our way, however, was broken by a cause which none of us foresaw a year ago. The re-constitution of Bengal means the abrogation of the settlements with the two existing Provinces, and has led to the formation of new settlements with the three Provinces which are now to take their place. Such settlements we have now framed, and the budgets for next year have been drawn up in accord with them. It was obviously impossible to endow the new arrangements with the same permanency as in the older Provinces. In Behar and Orissa there must be a considerable amount of initial expenditure before the Province settles down to normal conditions, and in Assam it will be some little time before we can estimate the permanent requirements of a tract which shows promise of important developments. Moreover, the methods adopted in framing the settlement standards were of necessity, in some measure, tentative and provisional. The arrangements which we have concluded, therefore, are for three years, in the hope that after that period expires it will be possible to gauge the needs of the new Provinces with sufficient accuracy to justify us in giving them permanent settlements.

50. In all other respects our temporary settlements follow the ordinary lines. In each of the three Provinces the Imperial Exchequer will receive one half of the receipts from Land Revenue and one half of the net receipts from Stamps and Assessed Tax. In Bengal and in Behar and Orissa it will take half the net irrigation revenue as well, and in the latter Province one-quarter of the net receipts from Excise. All other revenue and expenditure will be wholly Provincial and the shares which I have mentioned have been chosen with a view to bring the Provincial accounts as near to equilibrium as possible, so that the Local Governments may get the full advantage of their growing revenues. The standards of expenditure have been fixed with moderate liberality, and besides distributing the existing balances, we have strengthened the reserves of the new Provinces by initial grants aggregating £782,000. The Provinces will thus start their 1912-13 accounts with the following opening balances:—Assam with £267,000, Behar and Orissa with £833,000; and Bengal proper with a round £1,000,000. These figures exclude the grants made from the opium windfall in the current year; and the Bengal figure includes £267,000 held for the Calcutta Improvement Trust. Behar and Orissa are treated well because it needs substantial assistance in the task of establishing a new headquarters. Assam is a country of much promise, where we believe that judicious expenditure on communications and colonising will amply re-pay itself in time. Bengal proper has been contending for some years against serious financial difficulties which we are glad to mitigate particularly if we thereby facilitate the steady improvement of the administration in the Eastern districts. We trust that our liberality will be justified, and that it will be regarded as an earnest of our desire for the well-being of the three new administrations.

WAYS AND MEANS.

51. The management of our cash balances, and the provision of adequate funds for all the multifarious claims upon them, have presented no difficulty in the current year. Our capital programme for 1911-12 was the expenditure of £3½ millions on Railways and about £1½ millions on Irrigation. We proposed to pay off roughly £2½ millions of debentures, bonds and floating debt; while on the other hand, we meant to add £1½ millions in India and £1½ millions in England (the latter partly borrowed by Railway Companies) to our permanent debt. We expected that our cash balances in England and India combined would be reduced from £28½ to £21½ millions, exclusive in each case of the uninvested portion of the Gold Standard Reserve. The Secretary of State's Treasury drawings were taken in the Budget at nearly £16 millions.

52. The actual position has been stronger throughout. The total capital outlay (excluding a small sum for Imperial Delhi) has been only £9½ millions. Irrigation having used a small fraction of the Railway apiece. The re-payment of debt has been what we took in the Budget.—£1½ millions of Madras and Indian Midland Railway debentures, £½ million of annual drawings from our Indian Bonds and £½ million of India Bills withdrawn. We have borrowed as we proposed in India, but the operations of our Railway Companies in the London market have been disappointing, and the total addition to our permanent sterling debt has been only a little over £2½ millions. Nevertheless, our cash balances have fallen only from £30½ to £29½ millions. The great improvement is due chiefly to the growth of the surplus, both Imperial and Provincial; to a large increase in Savings Bank deposits; and to bigger credits from departmental and judicial deposits. The Secretary of State's drawings against our treasury balances have, owing to an active trade demand, been much higher than we provided for. They will probably be as heavy as £2½ millions, our surplus funds in India being thereby transferred to London, so that while our Indian closing balance is a little under 18 crores, that of the Home treasury will be about 17½ millions.

53. In 1912-13 we shall have to finance a capital programme of £9,000,000 for Railways, and of £1,416,000 for Irrigation, as well as to find £1,333,000 for the Imperial Delhi. We also have Madras and Indian Midland Railway debentures to the value of £1,478,000 falling due; and it is proposed to re-pay the whole of our outstanding India Bills of £1,500,000, as well as to meet the usual £500,000 drawings of India Bonds. Our special liabilities outside the revenue accounts thus come to roughly £18½ millions, which it is intended to finance as follows:—We shall have our estimated revenue surplus of £1,512,000. It is proposed to raise a loan of 3 crores (£2,000,000) in India and another of £3,000,000 in England; while it is hoped to obtain £1,810,000, through Railway Companies, apart from the money they raise for the discharge of debentures. This will give us about £8½ millions, and for the remaining £10 millions it may be for all practical purposes, be assumed that we shall draw on our high cash balances. The result of these, and of a host of minor and more everyday transactions will be to reduce our balances on the 31st of March, 1913, to approximately £19 millions. We estimate that the Secretary of State will sell Council Bills and Telegraphic Transfers upon us to the extent of £15½ millions; and the result will be to leave £8 millions in the Home treasury and 10½ crores in India.

We may regard 2 crores as being kept in hand for future expenditure on Imperial Delhi.

54. Besides the £15½ millions of drawings which I have estimated above the Secretary of State will, as usual, sell additional bills on India so far as our resources may permit, if there is a sufficient demand for them. All my announcements about loans and drawings are subject to the ordinary reservations: the Secretary of State and the Government of India retaining full discretion to vary the amounts mentioned above in any way and to any extent that may be thought advisable.

RETROSPECT AND CONCLUSION.

55. And now, My Lord, I have nearly finished. But before I sit down, I may be permitted a few words of retrospect. This is the last session of Your Excellency's Legislative Council which will be held in this chamber and this year is the closing year of the first triennial term for which the present Council was appointed under the new regulations. Next year we shall meet in different surroundings, and there will probably be a number of new faces among us. In such circumstances it is not unnatural that we should look back across the last three years and register the progress we have made. When I laid my first Budget before the Legislative Council of the old regime in March, 1909, I ventured to forecast the results of the then impending reforms on the branch of Government business which is immediately under my charge. I said that I did not fear the change, believed that though there would be increased and more searching criticism, it would proceed not from any intention to embarrass a public servant who was honestly trying to do his duty, but rather from a desire to help him to effect improvement. I said that I should welcome criticism, because I believed that my critics would be actuated by a common desire to improve the work of those who govern and the condition of those who have to bear taxation.

56. My Lord, I may confidently say that that forecast has been fully realised. It is not the time to sum up the influence which this Council has exercised on the general administration of India, or to estimate the services that it has rendered alike to the rulers and to the ruled. But I can testify unhesitatingly to the power that the Council holds for good in directing attention to the finances of the country, in scrutinizing expenditure, and in advising the Government on the employment of the public funds. I have always found the criticism of my non official colleagues temperate, suggestive and helpful. Unable though we may at times have been to accept their opinions at once, they have not been without their effect on our subsequent arrangements; and even where we wholly disagreed, they have shown us fresh points of view and warned us of probable dangers. It is no exaggeration to say that the free interchange of views which this Council stimulates, has already become a powerful factor for good in the financial policy of India.

57. It is not, however, the tendency of financial thought on which I wish to dwell to-day, so much as the movement of our finances themselves during the last three years. Measured by figures, this has been very striking. The year in which the new Council was elected, 1909-10 was one of slow and painful recovery from the effects of the famine and the international financial crisis of 1907. The shears of economy had to be brought out; but no great retrenchment was possible with the necessary promptitude, and some of the provinces—particularly Eastern Bengal and Assam—

were in serious difficulties like ourselves. There was also every prospect of a serious collapse in our opium revenue. The whole position was gloomy when the first of its Budgets was laid before the new Council, and it was my unpleasant duty to announce the imposition of new taxes. I am not going to fight all that battle over again. Recent events have somewhat obscured the necessity for the measures which we took in March, 1910; but I believe they have caused the minimum of hardship; and I am confident that time will justify them, when our opium revenue ultimately dwindles and our other resources are strained by the growing demand for more schools and healthier homes.

58. In 1909-10 we took in hand what I had recognised at a very early stage to be one of the main dangers of our financial stability viz. our liability for provincial expenditure and our somewhat ineffective control over it. A scheme of permanent provincial settlements was worked out, defining the resources of local Governments and providing a specific procedure for enforcing their financial responsibilities. That scheme is now in force, and I believe that it will be found a source of strength to ourselves and an incentive to economy in the provinces. This reform and a steady campaign against avoidable expenditure occupied most of our energies in 1909-10. But simultaneously the tide turned after the long depression which had begun in 1907, and since then there has been an almost unchecked advance in financial well being.

59. The actual figures of the period which I am reviewing may be stated very briefly. In 1909-10 the total revenue of India, excluding the gross opium receipts, was £69,100,000; in 1912-13 we expect that it will be £75,700,000. In 1909-10 the total expenditure of India was £73,100,000, for 1912-13 we are taking it at £79,300,000. The growth of normal revenue in the four years has been £6,600,000, the growth of expenditure has been only £2,200,000, and part of this latter figure represents special and non-recurring outlay (probably close on £200,000) out of the opium wind falls of the last two years. We are thus steadily building up our bulwarks against the dangers and the needs of the future. I am indebted to my official colleagues for their cordial co-operation in a policy of economy which though it is now beginning to bear fruit, must often have been a disagreeable duty, and which I could not possibly have carried through without their assistance and support.

60. An analysis of the expenditure of the period gives remarkable results. The growth in our total spending has been as I have mentioned from £73.1 millions to £79.3 millions or 8½ per cent. Within these total, however, expenditure on education has risen from £170,000 to £2,043,000 or by 78 per cent. and on medical and sanitary services from £208,000 to £1,653,000 or by 73 per cent. During the same four years the growth in Police expenditure has been only 10 per cent. and on our Military services it has been less than 1 per cent. There are obvious qualifications to all round percentage comparisons like these; but they do not obscure the main issue, the paramount importance that has been given during the lifetime of this Council to the furtherance of the objects which I know the Council has closely at heart. I might allude also to the increase in our provision for irrigation, both productive and protective, but time is short and I must pass on to the more general aspects of our financial situation.

61. The most faithful reflex of our general position would be found in an analysis of our public debt and the statistics of our foreign trade; but unfortunately figures for neither of these are yet available for the whole of the period, which I am reviewing. So far as our statistics go, there is clear evidence that the additions to our debt since 1908 have been more than covered by the value of the railways and irrigation works which they have helped us to construct and acquire. Our borrowings, both in England and in India, have been studiously moderate, and we have not yet approached the full £12½ millions railway programme which has been advocated. The £6 millions of floating debt which we had to raise in 1908, has been very much on my mind, but it will, if all goes well, be completely repaid next year, thanks to a large measure to our opium windfalls. The condition of our public debt is healthy. About our external trade I have already spoken at some length. Its total monetary value in 1909-10 was roughly 350 crores (excluding Government transactions). In the current year it will touch 415 crores. Even if we discount the element of high prices, this represents a great advance in trade and industry and as the balance is steadily in our favour, it means a strong exchange, good credit, and a ready inflow of the capital which India so badly wants for the development of its magnificent resources.

62. The mention of exchange brings me very close to currency. Our currency system has had a remarkable history—a history of which we may be pardonably proud—during the last three years. For a detailed examination of the present position, I cannot do better than refer Honourable Members, if they have not already studied it, to the admirable report on the operations of our Paper Currency Department which our present Comptroller-General, Mr Gillan published in October last. It contains an able and illuminating analysis of the movements and tendencies of our currency, and exemplifies the new spirit with which I trust that these important developments will be watched and guided. Three years ago, when this Council considered the first Budget, the position was unique. Our mints had stopped fresh coinage for over a year. The adverse balance of trade in 1908, had forced us to draw on our Gold Standard Reserve in defence of exchange; and against the gold thus released we had received and withdrawn from circulation in India the enormous quantity of 120 million rupees. Mainly through this cause our rupee reserves at the beginning of 1909-10 were enormously strong between our currency chests and the silver branch of the Gold Standard Reserve we had altogether 47 crores at our command, and in the strength of that accumulation we have been meeting all demands upon us ever since. The absorption of rupees in the intervening three years has been about 52 crores; and by whatever test the figures are tried, it is clear that the demand has been less active than in the earlier years of the century, when the resources of our mints were severely strained to meet the calls of trade for silver currency. This change in the habits of India, swift and momentous in its possibilities, has defeated the calculations of the silver speculators. It has also absolved me from the necessity of undertaking fresh coinage, in spite of no inconsiderable pressure from interested quarters.

63. To my mind it is a matter of no small satisfaction that the country is taking kindly to other forms of currency. We cannot look for rapid progress in the use of cheques and other banking substitutes for metallic money. But the extended employment of sovereigns and

of currency notes will lighten our burdens materially and must lead to greater elasticity and economy. I am particularly hopeful that the sovereign will push its way into popular favour. During 1909-10 no less than £9 millions were imported: in the following year over £8 millions; and up to December of the current year, a further £2½ millions. I do not attach too much importance to the spasmodic issues of gold for the movement of certain harvests in the more advanced areas. But I am convinced that these masses of imported sovereigns will not all disappear into hoards or the meltingpot; and that, as the people become more familiar with them, their use as genuine currency will very largely extend. The habit will probably come with a rush, as other changes have come in India.

64. No better precedent could be found for the change than the remarkable growth of our paper currency. In March, 1909, the volume of the note circulation was 45½ crores. In August, 1911, it overtopped 60 crores, and it is now rarely under 55 crores. We can hardly doubt that this rapid development had a share in easing off the demand for rupees. Nor is there any question that it in turn owes its success to the bold policy of universalising all notes from Rs. 100 downwards. The old circle system was devised as a precaution against the use of notes as remittances. Its abolition (except for high value notes) has shown that what the people may remit freely, they will treat with all the more confidence as currency, and we have the unquestioned authority of the Comptroller General for saying that no inconvenience whatever has resulted from the extension of the universal notes.

65. In all these ways our currency system has made notable progress in the last three years. We have fortunately been able to refrain from the fresh coining of silver: we have seen an imposing volume of gold flow into the country by perfectly natural channels, and the people have taken with avidity to a paper currency from which a number of obsolete restraints have been removed. If the free circulation of gold is not so much nearer as some of us would wish, it is certainly no further off. And during these three years our gold reserves have been greatly strengthened and their functions have been more clearly defined. I am well aware how robust and general is the feeling in India that the Gold Standard Reserve should be raised to a still higher minimum, and I confess to a lingering hope that this may yet be found practicable. But the matter rests in the hands of the Secretary of State for India, who keeps and controls the reserve, and who has accepted a wide responsibility for making it effective.

66. In the review which I have now given of the expenditure during the last three years, it will be seen how markedly the character of the allotment to certain services has changed.

Hon'ble Members will, I think, look back with satisfaction on the steady increase which has taken place during the first period of the life of the reformed Council in the expenditure on Sanitation and Education.

India owes a debt of gratitude to Mr. Gokhale for pressing to the forefront the claims of Education.

He has been fortunate in being able to do so during the Viceroyalty of one who has Education as much at heart as has Mr. Gokhale himself.

If I may be pardoned an indiscretion, I may mention that on the very first occasion when I discussed finance with His Excellency, very soon after he assumed his high office, he expressed a hope that the burdens on the

people would not be increased. He added that his chief desire was, that the amelioration of sanitation and the wide and comprehensive diffusion of education should form the chief features of His Viceroyalty.

It will be admitted, I hope, that I have endeavoured, by the provision of money, to second Mr. Gokhale's efforts, to support the Hon'ble Member in charge of Education, and to give effect to His Excellency's heartfelt desire.

67. The trend of expenditure is upward; but it is indeed a hopeful feature of the financial and political progress of this country that the growth of expenditure is occasioned, not by costly military operations, not by exaggerated Railway expenditure, not by wasteful extravagance in administration; but by well-considered outlay on services which tend to the moral and material progress of the Indian people.

THE BUDGET IN COMMITTEE.

The Hon'ble Sir Guy Fleetwood Wilson formally opened the first stage of the discussion on the Financial Statement for 1911-12 on the 7th instant.

A SPECIAL GRANT FOR THE UNITED PROVINCES.

The Hon'ble Pundit Madan Mohan Malaviya moved for a special grant to the United Provinces, equivalent to one-eighth of the land revenue. He contrasted the terms of settlement with other Provinces, such as five-eighths in Burma and one-half elsewhere, with three-eighths in the case of the United Provinces and quoted Sir John Hewitt in support of the contention that the United Provinces were entitled to a higher grant. Continuing, he said that the United Provinces had made the largest contribution to the surpluses of the Imperial Government, while the sum total of their share in all revenues was the lowest of all the Provinces.

The Hon'ble Sir Fleetwood Wilson in a long speech opposed the resolution and it was negatived.

THE HON'BLE MR. GOKHALE.

The Hon'ble Mr. Gokhale moved the following Resolution:—That this Council recommends to the Governor-General in Council that the amount of the loan to be raised during the next year be increased by Rs. 1 crore, so that the expenditure proposed to be incurred for building the new Delhi in 1912-13 should be met entirely out of loan funds, etc.

In doing so he said that the Revised Estimate showed a large surplus. Leaving the opium surplus aside, their ordinary surplus was one million. During this year the Government had paid Local Governments special grants amounting to 142 million or nearly one and a half million. If those extraordinary grants had not been made their surplus would have been higher by 142 million. About half a million was spent in connection with the Royal Visit on the Civil side and a very much also was special expenditure. They had a clear surplus of one million, and one and a half millions was given in grants to Local Governments, which was extraordinary and would not be repeated and one and a third million—

the cost to the Government of India in connection with the Royal Visit—altogether nearly four millions. If they had not made these grants and had not had that extraordinary expenditure, there would have been a surplus of nearly four millions. No reasons had been shown as to why the year to follow should not be as prosperous as the preceding year. The surplus had somehow been worked down to one and a half million. He wanted the Council, to remember that it was not a question of one and a half million, but of four millions in a year. If the estimate of the cost was correct the Government could build Delhi out of the surplus. Mr. Gokhale hoped that Government would build Delhi out of loans and devote surplus to reduce taxation or spend in some useful objects.

The Hon'ble Sir Fleetwood Wilson in a long speech referred to the three alternatives that were present before them, to raise a loan, to build Delhi entirely from revenues or to follow the precedent of the construction of Railways. He said that the first was found impossible as it would interfere with the raising of loans for productive purposes and the second as it would involve indeterminate liability. The third alternative was therefore decided upon as the best. He thought that it would not be wise to place the burden upon future generation when the cost of the new Capital could be met by surpluses made up also by loans. The motion was lost by 10 against 39.

GRANTS TO PROVINCIAL GOVERNMENTS

The Hon'ble Mr. Gokhale moved that the total amounts of the grants proposed to be made to several Provincial Governments during 1912-13 be increased to one million sterling, etc. He said that he had pointed out that morning that their real surplus next year would be nearer four millions than the million and a half mentioned in the Financial Statement. The question was how was the surplus going to be disposed of. It was an old standing controversy between the Finance Department and the Government on one side, and the Non-official Members on the other. The controversy had been going on year after year in that Council, and it would have to be continued until the Government changed their methods. As he had said, the public debt was very small, and there was no need to liquidate it out of their current surplus. The second argument was that money was required, especially as regards education and sanitation. These works would require not only tens but hundreds of crores of rupees, and the whole problem could not be satisfactorily settled unless the Government made regular allotments for them. The policy of making grants to Local Governments out of the surplus was generally condemned. It was no less than a system of doles, and the policy of doles, had been condemned by no one more strongly than the Finance Minister. The result of the present system was that there was a great deal of waste. The Local Governments were not sure that they could rely on a continuance of their good fortune, with the result that they dare not take in hand any scheme which required financing for a number of years. His proposal was that after the allotting of the surplus for the liquidation of, say, one-third of the debt for the building of Delhi, or other special object, let the remaining two-thirds be allotted to the Local Governments, not to be spent during any particular year, but to constitute Provincial reserves. This could go on each year, and then

when the Provincial Government felt that they were strong enough and that they had enough money in the Reserve, they could undertake non-recurring expenditure on schemes that were really needed. Under the present system it was not the most needy, but the most clamorous, Province which got the most from the Imperial Government, and a scheme like this on which regular allotments were made to each Province, would be much better and fairer all round.

The Hon'ble Sir James Meeson in reply said that Mr. Gokhale wanted to borrow more freely than the Government did. Mr. Gokhale would push on with the good work of education and sanitation and not worry about ways and means. What the Government had to do was to find as much money as they could, keep the growth of the public debt within moderate limits and reduce interest charges. The resolution was put and lost.

The Council adjourned till next day. The Council met next day when Hon'ble Sir Robert Carlyle introduced the Revenue budget.

PROTECTIVE IRRIGATION WORKS.

The Hon'ble Mr. R. N. Mudholkar moved that the protective irrigation grant be increased by Rs. 50 lakhs. He said that it was not many months since the whole country was trembling with fear at the imminence of a dire famine, but by the mercy of God they had escaped this calamity, though parts of Gujerat and Kathiawar were sorely distressed. It was natural that, at a time like this, they should look about and see what progress was made in carrying out the measures which were laid down authoritatively as necessary for insuring this country against the dire effects of famine. The Famine Commission recommended Protective irrigation works, and he was sorry to learn that last year there was a lapse of over Rs. 20 lakhs in protective irrigation works. He was also sorry to find that the results in protective irrigation works were exceedingly unsatisfactory. The Secretary of State had sanctioned the expenditure up to Rs. 100 lakhs a year, if the state of the finances allowed. He hoped they should have those Rs. 100 lakhs from the coming year. Then the Rs. 21 lakhs which were about to lapse should be restored, and adding Rs. 4 lakhs in view of the past short grants, the amount of Rs. 50 lakhs should be added to the Rs. 75 lakhs provided in the draft Budget.

The Hon'ble Sir James Meeson defended the allotment, and pointed out the big lapses in the past year under protective irrigation grant.

The Hon'ble Mr. Dadabhai opposed the Resolution, and dwelt upon the growing difficulty of labour in this country. He, however, acknowledged the services of the Hon'ble Mr. Mudholkar in keeping this question before the public.

The Hon'ble Sir Robert Carlyle said:—In spite of the best efforts of our irrigation officers, we have not been able hitherto to spend in any year on protective irrigation works a larger sum than Rs. 65 lakhs. As the Hon'ble Sir James Meeson has pointed out, the average annual grant during the past five years has been Rs. 73 lakhs, against which the average expenditure has been barely Rs. 60 lakhs. When discussing the Financial Statement for 1900-01, the Hon'ble Mr. Miller explained why some years must elapse before the expenditure on protective works would exceed Rs. 75 lakhs, the limit of expenditure at the time. To the explanations then given, I would add that, whereas protective schemes are situated for the most part in flat alluvial countries, those of a

protective nature are generally to be found in more rugged and hilly tracts, which naturally present much greater difficulties in the preparation and execution of an irrigation project. The very fact that a large portion of the grants lapsed in the Central Provinces shows the great difficulties that have to be overcome.

The Hon'ble Sir Guy Fleetwood Wilson said:—I have little to add to the interesting discussion that has taken place. I am in full sympathy with the object which the Hon'ble Member of this Resolution has in view. Our large Protective Irrigation Works are of the highest value in defending from the ravages of famine the areas which they serve, in saving the harvests, in preventing suffering and death, and in advancing the general well-being of the country. For such an object it would be far from my desire to withhold funds whenever they can be profitably expended. The only reason why I cannot accept the Resolution is that it points to what is at present an unattainable ideal. The day may come when we shall be able to spend Rs. 1½ crore, the figure which the Hon'ble Mr. Mudholkar's Resolution implies, on protective works every year, but that day has not come yet, and up to the present there have been difficulties in spending the allotments which we have provided. The motion was negatived.

GENERAL ADMINISTRATION.

The Hon'ble Mr. Subba Rao moved that the sum of Rs. 33,07,000 under the head No. 19 (4) be reduced by Rs. 5 lakhs. He said that under the head of General Administration the charges of the Government of India came up to quite as much as the charges of all the Provincial Governments put together (i.e., to more than Rs. 1 crore. Of those there were two large items. One was the Secretariats, costing about Rs. 33 lakhs, and the other was the offices of Account and Audit, costing nearly Rs. 28 lakhs. The Resolution which he moved dealt with the former. He wanted to know whether any attempt was made to review the expenditure under this head.

The Hon'ble Sir Reginald Craddock opposed the resolution and it was negatived.

POST OFFICE SAVINGS BANKS' CLERKS.

The Hon'ble Mr. Subba Rao next moved that the sum of Rs. 38,61,000 under the head No. 18 (2) be increased by Rs. 25,000. He specially referred to the grievances of clerks connected with the Post Office Savings Bank Audit and said:—I am sure that the Hon'ble the Finance Minister will deal with these 106 clerks in the Post Office Savings Bank Audit with the same generosity as he is dealing with the Opium Department employees.

The Hon'ble Sir Fleetwood Wilson in referring to the case of the clerks in Post Office Savings Bank Audit assured that he would do his best to see that no hardship is imposed upon them, and the motion was then withdrawn.

THE EDUCATION BUDGET.

In introducing the Education Budget heads, the Hon'ble Sir Harcourt Butler gave particulars of the distribution of the Rs. 10 lakhs recurring grant of which the Calcutta and Madras Universities get Rs. 65,000 each, Bombay and Allahabad Universities Rs. 45,000 each, Lahore University Rs. 35,000, and the future Dacca University Rs. 45,000. Aided English Secondary schools get Rs. 6 lakhs, mainly for improving the staffs, of which the Madras share is Rs. 80,000, the Bombay share Rs. 60,000, the Bengal share Rs. 1½ lakh, the United Provinces,

Punjab and Behar shares Rs. 60,000, the Burma share Rs. 40,000, the Central Provinces and Berar shares Rs. 35,000, the Assam share Rs. 30,000, and the North-Western Frontier Province share Rs. 25,000. Rs. 1 lakh will be held in reserve for the present. The Rs. 65 lakhs non-recurring will be distributed as follows:—(A) Rs. 10 lakhs for the Universities, viz., to Calcutta and Madras Universities each Rs. 4 lakhs, to Allahabad and Bombay Universities each Rs. 3 lakhs, to the Punjab University Rs. 2 lakhs; (2) Rs. 4 lakhs for special institutions, viz., the proposed Islamia School and College at Peshawar and the Victoria Technical Institute, Bombay, each Rs. 2 lakhs; (3) Rs. 10 lakhs for Hostels in Calcutta; (4) Rs. 10 lakhs for the completion of a residential scheme in Dacca for the future University; (5) Rs. 25 lakhs for Hostels other than those in Calcutta and Dacca, viz., to Madras Rs. 4½ lakhs, to Bombay Rs. 3 lakhs, to the Bengal Presidency outside Calcutta Rs. 4 lakhs, to the United Provinces Rs. 3½ lakhs, to the Punjab Rs. 2½ lakhs, to Burma Rs. 1½ lakh, to Bihar Rs. 3 lakhs, to the Central Provinces and Berar Rs. 1½ lakhs, to Assam Rs. 1 lakh. Rs. 50,000 will be held in reserve for the present.

SANITATION AND MUSEUMS.

In introducing the Sanitation and Museums heads, the Hon'ble Sir Harcourt Butler gave particulars of the allotment of special grants for sanitation, amounting to Rs. 60 lakhs, for distribution to Provincial Governments, and Rs. 10 lakhs for Research and Prevention work here. Madras gets Rs. 8 lakhs, Bombay Rs. 6½ lakhs, Bengal 7½ lakhs, Berar Rs. 462,000, Assam 146,000, the United Provinces Rs. 8 lakhs, the Punjab Rs. 6 lakhs, the Central Provinces Rs. 8 lakhs, the Punjab Rs. 617,000, Burma Rs. 4 lakhs, the Central Provinces Rs. 4 lakhs, Bangalore Rs. 50,000. The Rs. 10 lakhs will be expended on refitting and extending Laboratories as follows:—(a) Farel Laboratory, Rs. 2 lakhs for the extension of Research Work and for starting Teaching classes; (b) grant towards a Bacteriological Institute in Burma in connection with Pasteur Institute, at Maymyo Rs. 2 lakhs, (c) Rs. 6 lakhs will be granted to the Indian Research Fund. Of this Rs. 50,000 will be expended on the purchase of houses, and land in connection with the extension of Central Research Institute at Kasauli and Rs. 50,000 will be given as a grant for the extension of Fraser Town, Bangalore, and for further extension of rat proof buildings as an experimental measure against plague, and the remaining Rs. 5 lakhs for experimental work and measures against malaria and yellow fever. A governing body has been constituted in connection with this fund presided over by the Hon'ble Member for Education, and a Scientific Advisory Board has been elected by the governing body which advises on all matters requiring scientific investigation. The following steps have been taken to carry out the objects of the fund, the nucleus of which is Rs. 6 lakhs granted in 1910-1911. A scheme for the reorganisation and improvement of the Sanitary services has been submitted to the Secretary of State, and a grant of Rs. 2½ lakhs has been sanctioned towards its introduction when approved. A grant of Rs. 25 lakhs has been given for water-works and drainage works in the City of Madras, Rs. 145 lakhs in all is in progress, and the lump grant given will be a substantial contribution towards the balance required. During the last two years the Imperial grants for sanitation

exclusively of Rs. 75 lakhs for city improvement in Bombay and Madras have aggregated Rs. 116½ lakhs. The first All-India Sanitary Conference was held at Bombay in November, 1911. Surgeon General Lusk referred at length to medical research in India, and said that the money spent on it was money well spent, and that the officers engaged under him on medical research were making good progress.

REDUCTION OF ESTABLISHMENTS.

The Hon'ble Mr. Mudholkar moved that the Budget estimates be reduced by the pay of the Director-General of Archaeology and the establishment of his office. The Department, he said, was a small one, and he saw no necessity of maintaining the post of the Director-General of Archaeology.

The Hon'ble Sir Harcourt Butler opposed the resolution and it was withdrawn.

SALT EXCISE ETC

The Hon'ble Mr. Clark introduced the heads of Salt, Excise, Customs, the Post Office etc., Telegraphs, Stationary and Printing and Railways.

Mr. Mudholkar moved that the grant for Railways be increased by Rs. two lakhs for taking the main line of Shegaum Nagpur section of the G. I. P. Railway through Amraoti and (2) that out of the total amount allotted for Railway construction Rs. 50 lakhs be earmarked for being applied towards the construction of the Akola Basin Railway during 1912-13.

The Hon'ble Sir T. R. Wynne, replying said that Amraoti was not so important forty years ago as it is now. To make Amraoti connected with the main line, it would be necessary to construct a loop which would roughly cost Rs. 35 lakhs, which he said the Finance Department would never agree to give. He had asked the G. I. P. Railway to remove reasonable difficulties from which Amraoti was suffering at present.

In the course of his statement on Railways to day the Hon'ble Sir T. R. Wynne announced that 3500 additional goods wagons were being purchased. The other two Members of the Railway Board had already proceeded to the North-West to endeavour to devise further measures to relieve the congestion of traffic, and he proposed himself to proceed to Bombay shortly with similar intent.

The Hon'ble Mr. Mudholkar said that he was disappointed at the time taken by the Railway Board. The motion was put to the Meeting and negatived.

THE HOME DEPARTMENT BUDGET

The Hon'ble Sir Reginald Cradock, in introducing the Home Department Budget heads, specially referred to the grant of Rs. 5 lakhs for the establishment of a School of Tropical Medicine in Calcutta, and Rs. 1½ lakh for the Lady Dufferin Fund.

THE POLICE DEPARTMENT.

The Hon'ble Mr. Gokhale moved that this Council recommend to the Governor General in Council that the allotment to the Police (India, General) for the next year be reduced by Rs. 2 lakh. Mr. Gokhale said that as regards Police, the figures for Baluchistan and the North-West Frontier had decreased but the figures for India, General had increased considerably. There was not a word of explanation as to this increase, and as to the reason for it. The figures for the last

three years showed a continuous increase in the charges. In 1910-11 it was Rs. 844 lakhs, in 1911-12 Rs. 895 lakhs and now it was Rs. 932 lakhs. While in the Budget next year, the sum entered was Rs. 937 lakhs, the cost of the C. I. D. to the Government of India was given in one place as Rs. 283 lakhs and in another place as Rs. 305 lakhs. He should like to have an explanation of that discrepancy. It should also like to know how much of this represented the cost to the Government of India of the C. I. D. maintained and their own officers and men. In the Provinces which had C. I. D.'s of their own, there was constant friction between the Government of India C. I. D. men and the Provinces C. I. D. men. He should also like to know why the Government of India thought it necessary to maintain branches of the C. I. D. in the Provinces. Not only were the men of the C. I. D. dandierheads, but they carried out their work without due regard to appearances and even common decency.

The Hon'ble Sir Reginald Cradock in replying said that the C. I. D. of the Central Government should be an organisation able to cope with the crime ramified all over the country. The Police Commission said that they were convinced of the necessity of the Government of India having a much more intimate knowledge of what was going on in the Provinces and elsewhere than at that time existed. In pursuance of that policy it had been found necessary to employ officers attached to the Central Government, whose duty might take them further afield and keep them there some time. He did not think three lakhs was too much to spend yearly. The resolution was withdrawn.

The HON. MR. GOKHALE'S SPEECHES

This is the first collection of his speeches and may claim to be fairly exhaustive, no important pronouncement of his having been omitted. The book contains four parts and an appendix. The first part includes all his utterances in the Supreme Legislative Council and in the Bombay Legislative Council; the second, all his Congress Speeches, including his Presidential Address at Banaras; the third, speeches in appreciation of Home, Naoraj, Ranade, Mehta and Ranmore; the fourth, miscellaneous speeches delivered in England and India. The appendix contains the full text of his evidence both in chief and in cross examination before the Welby Commission and various papers. These cover nearly a quarter of a century of a most strenuous, selfless and active public life and embrace the whole range of topics that have engaged and are still engaging the attention of the public. Full of instruction on every point and breathing in every line the moral fervour which is Mr. Gokhale's supreme characteristic, this volume, the public leaders venture to hope, will command wide popularity.

Crown 8vo., 1,100 pages, Cloth Gilt
Rs. 3. To Subscribers of the "Indian Review," Rs. 2-8

The Statesman.—Not only the admirers of Mr. Gokhale, but all those who wish to study the political and economical situation in this country fully will welcome the volume of his collected speeches which has just been published by Messrs. Natesan & Co., Madras, the well-known publishers of the Indian Review.

G. A. Natesan & Co., Sankaraya Chetty Street, Madras.

Current Events.

BY RAJOUARI.

DEMOS IN THE PERSON OF BRITISH LABOUR.

A T last Demos in the person of Labour is vigorously asserting himself in old and aristocratic England with her free institutions. He is asserting himself with a determination and set purpose which reveal what a power he is in the land and what a potent factor for weal or woe. He is waging an economic war to the knife with a doggedness and perseverance which at once inform the civilised world of the new forces which are welding themselves into shape for a new industrial revolution the end of which none can foresee at present. The war cloud, no bigger than the human hand, had shown itself in the distant horizon some weeks ago. Its portent was significant enough. But it was hardly expected that that cloud would soon bedarken the whole horizon and bring in its train such untold consequences as are to be discerned to day. Strikes there have been of late, strikes of a variety of hue and a variety of strength, but none had forecast a strike of the coal-miners of the colossal magnitude as has presented itself to the British employers of labour—a strike of such prolonged duration and calculated intensity. In these sturdy miners who have struck work for weeks past all over England we discern the strength of organised Labour at its climax. Confining above all others, is the premier Labour of the old country; and coal is verily the industrial King. Without coal every other industry, however flourishing and however stable, must come to a deadlock. And the coal miners have certainly brought a deadlock against which hitherto all the efforts of persuasive oratory and all the logic of stern and unbending arguments has been in

vain. The iron of the mines themselves seems to have entered the soul of each and every unit of the millions of miners. Like the iron-hearted Covenanters of old, they seem stern of word and will, as if to say, they are prepared to die, come what may. No longer they shall be the galley slaves of the mine owners or the mining Syndicates. Too long have they endured their tyranny aye, economic tyranny which is infinitely more galling than that of the despot. They must once for all break loose from their chains. They must emancipate themselves from their industrial thralldom. Long indeed have the owners and employers sucked their flesh and blood on a weekly pittance while they had had illimitable cakes and also to fatten themselves. That flesh and blood can no longer be available on their own conditions. The world is changing. Science and invention are progressing by leaps and bounds. A thousand industries, aided by science and invention are prospering beyond the dreams of avarice. Everyone is enriching himself except the labourer, and most especially the hard worker in subterranean mines, with his life daily in his hands. Shall he go quite unrequited? Shall he alone be deprived of the just dues of his daily hard task. The convict labouring in the jail has not a hundredth part of the hard labour that he daily undergoes. And yet in the midst of the surrounding plenty, notably the plenty of his own employers, he cannot subsist. He cannot make two ends meet. He has nothing to lay by for a rainy day while the children grow around him, while he and they live in unhealthy slums, surrounded by filth and equalor, with no bright or cheering prospects to smooth and comfort the pillow of old and declining age. And who will deny that this is the daily lot of the average coal-miners? Who can deny that the wage he earns is hardly a bare living wage. So long as he was not strong, so long as he was illiterate, so long as he was not in a position to assist himself, he

that the Civil Court has given its solemn verdict in the matter of the patriot Ferrer whom an unjust Court Martial sent to the gallows. It has unequivocally declared him to be free of the crime imputed to him by a conscienceless and vindictive body of unscrupulous priests, the sworn enemies of progress and civilisation and Christian morality. Signor Canalis has had to eat the pie of humiliation after the judgement of the Civil Court and suffer not a little in popularity.

Russia is still in the throes of a dire famine but there is a surplus, so they say, which permits an expenditure of 16 millions sterling to alleviate the appalling distress of the vast agricultural population. The Duma meanwhile is in a condition of suspended animation. But Russia is quietly rebuilding her shattered navy and other wise preparing for a renewed struggle at the right psychological hour to regain her lost prestige. Meanwhile she is still sitting tight on Northern Persia, though the grip has been somewhat loosened, thanks to the mild coercive policy to which Parliament has driven the British Foreign Minister to adopt.

Turkey and Italy are still cutting each other's throat. Reprisals are the order of the day. Crippled in her navy, the former is able to do next to nothing on the waters of the Mediterranean and the Aegean. But she is actively pursuing the policy of driving out bag and baggage every Italian from her territories in Europe and Asia. The boycott is no mean instrument in modern war policy for harassing the enemy and inflicting a terribly heavy pecuniary punishment. There is now a report of some pourparlers by the representatives of the Great Powers with the pirates of Italy who have sacked Tripoli in broad daylight. The world outside Europe views with humiliation that these Powers should have ignominiously failed to intervene at the very outset and arrested Italy in her piracy. But Europe's political ethics are also of a piratical

character so that we at least despair of Europe so far as her political morality is concerned. It is worse than that of the Bedouin of the desert.

PERSIA.

Affairs seem to be a shade better in that unhappy country. That contemptible ex-Shah has been now compelled to retire to Baku and beyond it, Sir Edward Grey having at last put his foot down on the despicable machinations of the Russian Foreign Office. So far it is a good riddance. They are now trying to send out of the country the traitorous brother of the ex Shah. Meanwhile some Russian troops have been withdrawn and Sir Edward Grey has promised to see that there is no military occupation, with a view to permanency, of the Russians. Sir Edward has been driven of late, thanks to the strong demonstration against his recent vacillating, if not humiliating, policy, into adopting measures worthy of the British nation, and sufficiently strong to inspire renewed hope and confidence among the patriotic Persians. Financial aid needed to restore order all along the commercial roads and elsewhere, has been given and a sufficiently large loan to rehabilitate the finances and develop the resources of the country is promised. There is now some hope of Persia's emancipation from the thralldom of the scheming Muscovite.

CHINA.

Yuan Shi Kai is now the President of the Republic with his headquarters at Tientsien, Dr. Sun Yat Sen has agreed to the capital being still at Peking. But anarchy is still rampant in the northern provinces where there is a continuous bloody skirmish between the hated Manchus and the indigenous Chinamen. The situation is still stormy but every hope is entertained that the First President will soon lay low the forces of anarchy and restore order leading to the development of China. The constituent assembly is still to be formed and the constitution is still in a nebulous condition. But both are expected to

be accomplished facts in a short time. In the meantime the tension is great. Trade is disorganised and the foreign legations are hard at work to support the President in his arduous labours to make China contented and peaceful.

THE DALAI LAMA.

This reincarnated Lama is said to be still hovering on the border line which divides Tibet proper from the British boundary. He is trying to gather round him an army of loyal supporters who may safely ensconce him at Lhasa and allow him to exercise his former sovereignty. But the Chinese suzerainty is now every way stronger than when the Lama was obliged to flee to Urgua as a refugee in the Russo-Mongolian camp. At the same time there is some informal or unauthorised coquetting of a few British Imperialists going on which bodes no good. But we have every faith in the statesmanship of Lord Hardinge that it will on no account allow anything which should lead to the re-entry of the British in Lhasa which is the objective of the red-hot Imperialists on the border.

Who's Who in India:—As was announced early in 1911, the Proprietor of the Newal Kishore Press, of Lucknow, Cawnpore and Lahore, has recently published a most useful handbook, "Who's Who in India," containing the lives and photographs of all the Ruling Chiefs, Nobility and Titleholders of India. This work is an unique one in many respects. The book, which is published in three editions, is handsomely got-up, and is a most valuable work of reference. No other work of the kind has ever been published in English. The value of the work is enhanced by the inclusion of handsome photographs of Their Imperial Majesties the King-Emperor and Queen-Empress, with their biographies, and the publication therefore forms a splendid Souvenir of the Royal Visit to India and the Coronation Durbar.

THE WORLD OF BOOKS.

[Short Notices only appear in this Section.]

Literature and Nationality. *By W. B. (William Blackwood & Sons).*

Literary criticism in the nineteenth century has laid special stress on the intimate relationship existing between literature and the political and social circumstances of the country. It is possible to carry this study to the excesses of the scientific analysis of M. Taine, but there is no denying the great value of such a pursuit. The address is a brilliant, and sober enquiry into this question. The possible influence of literature on the formation of nationalities—used in Bluntchli's sense of political solidarity—is discussed in a masterly manner with illustrations selected from the entire range of the world's history. It is stimulating, fresh, and full of the academical spirit.

The Evils of Alcohol. *By Dr. W. A. Chapple, M. P.*

This is a popular hand-book treating of the evils of indulging in alcohol in any quantity or form. The keynote of the whole book consists in considering alcohol to be a poison having a special affinity for the nerve centres of the brain. Alcohol paralyses these nerve centres in the inverse order of their development, the last developed suffering first and most, and the first developed last and least.

The intense craving for alcohol when once the habit of taking it is formed is very graphically described. A number of cases illustrative of the effects of alcohol are described in detail and some of them reveal the incidental diseases associated with it.

Temperance lecturers will find the book very useful in enabling them to depict the social, moral and physical evils following in the wake of this unique substance. We extend a cordial welcome to this book and trust that it will have a large circulation among the educated Indians some of whom have contracted the pernicious alcoholic habit.

HIS HOLINESS THE LATE JAGADGURU OF SRINGERI.

TO THE MEMORY OF HIS HOLINESS THE LATE JAGADGURU OF SRINGERI.

BY

MR. K. S. RAMASWAMY SASTRI, B.A., D.L.

That he should mingle thus with Heavenly Light,
That his soul's stream should meet Love's ocean sweet,
That he should haste with glad and eager feet
To gaze upon the glory of His Might—
Were dear to him who deemed our life a night
And hoped on Death's bright Dawn God's sun to greet
And yearned to reach His sweet and heavenly seat
Absorbed in worship of His radiance bright.
The loss is ours Who else is there to dower
With peace our souls and ope with loving arts
Our lidless but unseeing inner eyes
And make us know true wisdom's peace and power
And cleanse the foulness of our worldly hearts
And show us glimpses bright of paradise?

Diary of the Month, February—March 1912.

February 24. The re-opening of the Parliament at Rome was attended with delirious enthusiasm.

The Chamber, by 423 votes to 9, ratified the decree affirming Italian sovereignty over Tripoli.

February 25. Mr. Justice Karamat Hussain, of the Allahabad High Court, a great advocate of female education in India, has made an endowment of Rs. 1,80,000 towards the cause of female education. The fund is to be called after his name "Karamat Fund"

February 26. The Dewan of Trevandrum opened the 8th Sessions of the Sri Mulam Popular Assembly this noon at 12 with an excellent address

which was read in his characteristic assured tone and clear voice. The various fresh items therein made created great satisfaction to the members. The British Resident and all the leading officials of the State attended. The Jubilee Town Hall was full.

February 27. At the Viceregal Council meeting to-day, in opposing the Resolution of Mr. Dadaboy regarding the appropriation of Jail products, the Hon'ble Sir Reginald Craddock said that there were several objections to Mr. Dadaboy's suggestion. First of all, it would be almost impossible to calculate the share of profits made by prisoners. The cost of Jail administration in India at present was about Rs. 79 lakhs, of which they only got back about Rs. 14 lakhs, and Mr.

After answers were given, the Hon'ble Sir Guy Fleetwood Wilson formally opened the first stage of the discussion on the Financial Statement for 1911-12.

March 8. The Hon'ble Mr. Mudholkar moved that that the Budget estimates be reduced by the pay of the Inspector-General of Forests and of the establishment of his office. In the course of an exhaustive speech he said that for years the Non-official Members of the Council and Indian publicists were alarmed by the continuous growth of expenditure and they had been urging upon the Government the urgency of arresting this growth and of effecting economies.

The Hon'ble Mr. Gokhale moved for the appointment of a Committee to enquire into the great increase in public expenditure, but the Finance Member advised the Council to await the result of the unassisted effort of the Government of India before pressing for an inquisition.

March 9. President Taft, speaking at Toledo, Ohio, condemned emphatically as a crude, reactionary and unstable policy that lately advocated by Mr. Roosevelt in favour of revocation of judges by popular vote, and the submitting of judgments to the people.

March 10. Yuan-Shi-Kai has been inaugurated as Provisional President in the presence of representatives of all provinces and sections of the community.

The ceremony was an imposing one.

Yuan-Shi-Kai wore military uniform, and the others present wore uniforms or frock coats.

The presence of veterans and younger leaders provided a scene typical of the Chinese transition.

March 11. The French miners have struck for a day, to call the attention of the Government to their grievances.

March 12. The Scottish Liberal Members of the House of Commons gave a banquet in honour of Lord Pentland's appointment to the Governorship of Madras. Mr. McKinnon Wood was present.

Lord Pentland was presented with a silver and a coffee-pot. Mr. Asquith made a speech and referred to Lord Pentland as "the one great man of Ayrshire." "His name," added the Premier, "would always be associated with the passing of the Scottish Land Bill." Mr. Asquith anticipated that Lord Pentland would earn fresh honours in the carrying out of his arduous duties in Madras.

Captain George Swinton was to-day unanimously elected Chairman of the London County Council. On taking charge, however, he stated that he would only be able to hold office for a fortnight, as he was going out to assist in the planning of the new city of Delhi. He had only received the official announcement that afternoon.

March 13. The Imperial Legislative Council met at 11 this morning. H. E. the Viceroy presided. There was a large attendance, and the visitors' gallery was full. After the interpellations the Rules were suspended. The Hon'ble Mr. Gokhale moved his Resolution on the resources of Local Bodies.

March 14. At the Imperial Legislative Council meeting to-day, in reply to the Hon'ble Mr. Bhugri, the Hon'ble Sir Reginald Craddock, on the subject of inconvenience caused by official tours, said that the replies of Local Governments had been received and the question was still a subject of correspondence with the Secretary of State. It was not desirable to issue uniform and detailed instructions for all India, but Provinces had already issued orders which conformed generally with the recommendations of the Decentralisation Commission. The Government of India were satisfied that Local Governments were already dealing adequately with the question.

The *Times* to-day states that the Indian Crown, of which the cost is £60,000 and which is to be placed with the other Regalia in the Tower, will be available for future Imperial Durbars.

March 15. Lieutenant-General Sir Reginald Hart V.C., K.C.B., K.C.V.O., (General Officer Com-

manding in Chief in South Africa since 1912) has been gazetted to succeed Lord Methuen as Governor of Natal.

March 16. The Convocation of the Calcutta University was held to-day, H. E. the Viceroy, the Chancellor, presiding, supported by the Rector, His Honour Sir William Duke, and the Vice-Chancellor, Sir Ashutosh Mookerjee. The Honorary Degree of Doctor of Philosophy was conferred on Lieutenant Colonel Phillott, and of the Doctor of Science on Professor Benhl and Professor Jagadishchandra Bose. There were 1,469 graduates, including seventeen ladies, the principal figures being:—M.A. 136, B.A. 633, B. Sc 139 and B.L. 315:—

March 17. Mr. Hartshorn, the Welsh miners' leader, declared in a speech that compulsory arbitration would not settle the strike.

He said: "The outstanding fact is that the workers are masters of the situation. They have all the power. It is simply a question of how they will use it."

March 18. The death is announced of Colonel Sherlock, for thirty years teacher of Hindustani at Cambridge University.

March 19. The District Magistrate has directed the publisher of the *Zemindar*, a Mahomedan vernacular paper of Lahore, to deposit two securities of Rs. 1,000 each for its weekly and daily editions, and has also called upon him to make the requisite declaration for the daily edition. The District Magistrate says that its tone is exceedingly immoderate and objectionable, also that the publisher has not abided by the compact that the daily edition would be a supplement to the regular weekly, and confined to telegraphic news.

March 20. At to-day's Meeting of the Calcutta Corporation the draft Address to be presented to H. E. Lord Carmichael, first Governor of Bengal, was settled by the special Committee.

March 21. Mr. La Follette, an Insurgent

Republican, has defeated Mr. Roosevelt in the Presidential primary elections at Dakota.

March 22. King George this morning received Captain Swinton, Mr. Brodie and Mr. Lutyens, prior to their departure for India.

March 23. His Majesty the King Emperor has been pleased to appoint His Excellency Baron Carmichael, Governor of Madras, to be Governor of Bengal with effect from the 1st April.

His Majesty has also been pleased to approve of the appointment of the following gentlemen to be Members of the Executive Council of His Excellency the Governor.—The Hon'ble Sir Frederick William Duke, at present Lieutenant-Governor of Bengal; the Hon'ble Mr. P. C. Lyon, Member of the Board of Revenue, Eastern Bengal and Assam; and the Hon'ble Maulvi Syed Shamsul Huda, of Eastern Bengal and Assam, at present an Additional Member of the Legislative Council of the Governor-General.

March 24. A Public Meeting of the European and Indian residents of Calcutta was held this afternoon in the Town Hall to commemorate the memory of Miss Margaret Noble, better known as Sister Nivedita. Mr. R. H. A. Gresson, Sheriff of Calcutta, opened the Meeting and asked Dr. Rash Behari Ghose to take the Chair.

Messrs. Surendranath Bannerjee, A. J. F. Blair, Gokhale, Madan Mohan Malaviya, Wased Hassein and Bhupendra Nath Basu took part in the proceedings.

March 25. A meeting of the Imperial Legislative Council was held to-day. H. E. Lord Hardinge presided. There was a fairly full attendance of Members, and the spectators' galleries were full.

The Hon'ble Sir Harcourt Butler, replying to the Hon'ble the Rajah of Dighapathia regarding the appointment of qualified Indians in the work of the scientific investigations of tropical diseases, said:—"The Government of India will always employ the best man available for any enquiry of a scientific nature, no matter what his race or creed may be. Dr. Korke, who is an Indian, has recently been appointed to enquire into *Kala azar*,

TOPICS FROM PERIODICALS.

Democracy in India.

Mr. K. M. Munshi, in a thoughtful article on the "Spirit of Democracy in India," in the *Hindustan Review*, for February, sees in the recent history of many Asiatic nations including China, the fulfilment of Locky's theory that the conception of democracy will necessarily, at least for a considerable time, dominate in all civilised countries. Speaking of the necessary ideal for a real democracy he says: "The true democrat ought to realize the nation in himself, to look upon his compatriots as brothers, to yearn for corporate good—to exult in national glory—to feel 'I am the nation.' This political yogism is the only passport to escape the annihilation which threatens every people who lack the democratic instinct." After the chaos that has prevailed in the past, we see the beginning of a certain active public life in our country in recent times. Education and foreign travel have been the main forces of our regeneration. The increased spirit of industrialism has also fostered some democratic virtues. "Lastly, local self-government more than anything else given to us by our Government, has been the chief instrument of bringing about in some measure that spirit of democratic responsibility which constitutes the strength of free nations." We have to struggle chiefly against caste, and in the cause of Education. "The principal vicio which obstructs our progress and which slavery and an uncommon religiosity have naturally fostered is a strange sort of apathy for public matters. An average educated Indian looks upon the affairs affecting the body politic with an air of careless indifference which is sometimes shocking to behold. He waxes eloquent and enthusiastic in the closet, yearns to work when in the privacy of his room; but the step which takes him to the outer world deprives him of the force of his convictions."

The Hindu Ideal of Sovereignty.

Mr. S. Gopala Aiyer writes an interesting article on the "Hindu Ideal of Sovereignty," in the February issue of the *Madras Christian College Magazine*. As illustrated by Kalidasa, the word in Sanskrit for the king, राजा is from the root रञ्ज्, to please. In "Sakuntala" is expressed the idea that "uneasy lies the head that wears the crown."

It was held to be characteristic of kings that they cannot bear to hear any kind of plaintive voice, for the latter is considered a signal token of misrule. They were regarded as the parents of orphans and the children of the childless. In the same drama, *Sakuntala*, it is said that Dushyantha proclaimed by tom-tom that he was to be considered the father, son, husband and brother of his people except in so far as those positions do not conflict with *Dharma*. In all the actions of a sovereign it is assumed that self has been submerged, and that his central idea is the happiness of others. One king is reported to have said:

जन्मप्रसूति परार्थमेव सर्वं मया परित्यज्यते

From my birth all my actions have been for others' good.

Prowess is indeed an important feature in the Hindu Ideal of Sovereignty. Our kings ever disdained to flinch in times of distress and difficulty. Guarding the grave, the dethroned Harischandra says: "My head is ready; come on, difficulties! I welcome you." Visvamitra exemplifies earnestness of purpose which scorns all obstacles. All these great minds exhibit no less the softer emotions of reverence, obedience and tenderness.

If anything went wrong in the state, if the young died breaking the hearts of the old, it was attributed to the अन्याय or unrighteousness of the king. Even the misdeeds of the people were laid at the door of the king, for the Sanskrit expression went—यथा राजा तथा प्रजा: "As the king, so the people." This might appear to be an extreme view of the case, but to the mind of the Hindu, who associated kingship with divinity, this did not seem too much to expect of him.

The Hindu king was especially the patron of arts and literature. Charity was above all his chief adornment.

Indian Craftsmen.

The Dawn and Dawn Society's Magazine, for January puts forth an eloquent plea for a better encouragement of Indian craftsmen than before by the Government of India.

We pointed out that the new architectural works that are to be raised at Delhi will give an opportunity to the Government to carry out one of the earnest wishes of the King-Emperor,—namely, to “show sympathy with the artisans of India”—we are quoting His Imperial Majesty's own words—if instead of the European style of designing, the Indian style be adopted at Delhi in connexion with the new buildings. We are exceedingly glad that this point has been clearly brought out in two letters which have since appeared in the columns of two leading London dailies.

Mr. Havell has always championed the cause of Indian architecture and will rejoice to see edifices rise in Delhi after the fashion of those by Jehangir and others, if the Government is wise to abandon its encouragement of the ugly Western architecture.

The influence that may be exerted by the Supreme Government on the tastes of the wealthier classes of the country, by its deciding to build their own buildings at Delhi not according to the time-honored traditions of the Public Works Department of the Government but in consonance with the artistic and architectural and imperial traditions of the Imperial city is bound to be very great. For as the seat of the Government, say what people may, Delhi is bound to rise in time to most imposing proportions. Being in the political focus of the country, it will attract to it the leisured classes from all over the country, and, more than ever Calcutta did, the visitors from outside India.

“A great impetus to the loyalty of the masses of India would be imparted,” if the Government should feel for the poor Indian artisan, in whom our King-Emperor has always evinced deep interest, at this time when a large scheme of Public Works will be before the Government in the construction of the new capital.

English and Indian Nobility.

A writer in the *Rajput Herald* presents a comparison of the nobility in England with that of India, resulting unfavourably to the former. The latter he identifies with the Rajput nobility. He writes.—

The conception of nobility in India is the very embodiment of virtue and greatness. When you say *Rajput* you mean the combination of best and most useful elements of the universe, you mean virtue, truthfulness, honesty, filial affection, heroism, chivalry, self-respect and self-sacrifice. These are the various component parts by which the indissoluble compound is built up. These are the foundations on which a Rajput stands. You might shake him and perhaps change of conditions, evolution of society and revolution of social order of things, might drift him away from the path originally occupied by his ancestors and forefathers, but he cannot in spite of all adverse forces of nature, be moved from the bed-rock on which his ancestry was built. The very mention of the name Rajput would suffice in instilling in him the deepest and most profound knowledge of *Atman* self and *Isvar* God. The ideal of ethics and morality are always before his eyes. They are written in plain and unmistakable words for his guidance, and however depraved he might be, yet he will not, consistent to his birth-right, consistent to his ancestry, consistent to his position, degenerate into a commonplace English noble.

I can sum up the difference between an English noble and the Rajput—the representative of the Indian nobility—in the following words: *The English nobleman of the present day, unless superior education and sensitive or psychic causes tend to melt him into a new body, does not rise above an average commoner with ordinary education and attainments.* The nobility of England, having been subjected to irresponsible alterations and topsy-turvy condition of affairs has lost its pristine purity. But the Indian nobility—the Rajput—has not lost its potentiality but retains the same spirit which animated its ancestors centuries ago. The English nobility hangs between the devil and the deep sea, ignored by its own kith and kin, and disliked by the middle and lower classes of society. Its *locus standi* is like the position of the bat, which scoffing at a bird's life pretended to be an animal. But the animal scoffing at its pretensions refused to recognise it as such. Thus lost to its own near and dear and kicked off in new quarters, it had to suffer solitude and privation. Thus in the position of the English nobleman, occupying a plane, all his own, neither approached by his fellow lord—I mean the very few remnants of original nobles—nor welcomed by the commoners from whom he departed in indignant pride.

But the Rajput is loved by the Hindu, he is recognised as great by all ranks and classes of Hindu society, and his position is sound, safe and stable.

The History of India and Its Study.

A melancholy interest attaches itself to the first of a series of essays on the above subject by the late Sister Nivedita appearing in the *Modern Review* for March. She will not believe that the facts for building up Indian history are scanty. Her genius suggests new realms of knowledge to help us in determining the history of the past.

It will be from amongst the records of home and family-life, that light will be shed upon the complete history of Bengal. It will be by searching into caste-origins, and tribal traditions that real data will be gathered for estimating the antiquity of processes. My friend Babu Dinesh Chunder Sen, says that he believes, from a study of pedigrees, that an overwhelming proportion of the higher-caste families of Bengal came from Magadha. If so, it is necessary to assume that there was at a certain time, a wholesale evacuation of Magadha. This would agree so well with the facts of history—the removal of the capital to Gour, on the destruction of Pataliputra, and the immense cultural potentiality of the Bengali people,—that the suggestion cannot fail to form a dominant note in subsequent research.

She next urges that when we have reached a new fact, the next effort should be to relate it to known central events.

We learn, too, that lesson which botanists, zoologists, and geologists, have had during the last century to learn and teach, namely, that things which are found together may have taken wide distances of space and time to produce.

Passing on to another subject she says:

The year as we go through it, constitutes another kind of historical record. The festivals of the old village life which follow each other in such quick and delightful succession throughout the twelve or thirteen moons of the solar year, are not all effects of some single cause. On the contrary, the Car-festival of July hails from Buddhism, and has the great metropolis of its observance at Puri on the Orissan Coast. But Janmashtami belongs to the Vaishnavism of Krishna, and turns our eyes in a very different direction, to Mathura and Brindavan. The Dewali Puja, again, connects us on the one side with the famous Japanese Festival of Lanterns, and on the other with Latin and Celtic anniversaries of the souls of the dead. How different are the thought-worlds out of which spring inspirations so various as all these! How long a period must each have had, in order to win its present depth and extent of influence! The very year as it passes, then, is a record of the changing ideas that have swept in succession across the Indian mind.

Talking of the various conditions that have produced the complexity of the Indian calendar she says:

Historical events as such have never been directly commemorated in India. Yet perhaps, had Guru Govind

Singh in the Panjab or Ramdas of Maharashtra lived in the time of the Empire of Gour, they would have obtained memorials at the hands of Bengali Hinduism. The fact that none of their age have done so shows that the calendar was complete before their time. Even Chaitanya, born in Bengal itself and a true product of the genius of the people, is scarcely secure in the universal synthesis. His veneration, like that of Buddha, is overmuch confined to those who have surrendered to it altogether. But if in the intellectual sense we would fully understand Chaitanya himself, it is necessary again to study the history of India as a whole, and to realise in what ways he resembled, and in what differed from, other men of his age. What he shared with all India was the great medieval impulse of Vaishnavism which originated with Ramana and swept the country from end to end. That in which his Vaishnavism differed from that of the rest of India represents the characteristic ideas of Bengal under the strong individualising influence of Gour and Vikramপুর.

The Japanese Pariah.

Dr. Montono writes an interesting article on "the Japanese Pariah," in the *Japan Review*, for February. The "eta," as they are called, were excluded from the ordinary rights of citizenship till 1871, when the present Emperor granted them legal emancipation. They were originally prisoners taken in battle and enslaved, and more largely the conquered aborigines of the soil. Through their faith in Buddhism, the Japanese have come to hate all such labour as will involve the torture of animals and the handling of things like hides; and so all the " nasty " work has fallen on the eta, even as in India. The eta came to receive additional contempt owing to the practice in the past of banishing criminals to that class. Even as the Indian butlers and their menials in European households in India are from the Pariah caste, the etas furnish in Japan the servants of foreigners. After the emancipation effected some forty years ago, the eta have considerably progressed in social status. They are not infrequently members of the Imperial District. They have even so largely intermarried with the other classes that eta origin is not very distinguishable Japanese people to-day.

Swami Dayanand Saraswati's Teachings.

The Fedic Magazine publishes some noble teachings of the great Swami, by Mr. Shiv Nandan Prasad.

It is no fault of Religion if in course of time it gathers corruption, decays, and dies. It is the common lot of everything. As well we might find fault with our body for growing old and infirm and finally succumbing to the cold touch of Death.

A religion disappears or more correctly speaking the old form of a religion perishes when—Laziness having taken a step forward—is no longer capable of doing duty as an adequate guide to the new and advanced stage of life entered upon.

He accounts for the rise and decay of Buddhism. He next takes up Muhammadanism.

The weak point in Hinduism is its lack of solidarity. The Brahmins are learned, the Kshatriyas are brave, the Vaishyas are industrious, the Sudras are obedient and willing—the materials are good but there is nothing to bind them together—to solidify them—to make them think and act as one body—as one living organism.

I have a suspicion that the element of disintegration is to be found in the spirit of classism or caste system that has so clung to the Hindu.

And now came the onsets of the Muhammadans. With a creed simple but stern and austere, and an organisation the very pink of perfection, Muhammadanism was bound to prevail over the imponderable, unstable Hinduism.

After the men of the Religion of the Sword have come to India another superior race, the English. They have given peace to the mild Hindus. An era of order and progress and honesty and security has begun. But greatest of all, the British have inaugurated a complete system of Education which has opened out to India progressive ideas.

Looked at from the European point of view, Dayanand's character will command respect. His severe morality and purity of character, his noble aims and sincerity of purpose, his fearlessness, perseverance and energy, his selfless devotion to his country and his people, these are traits of character which cannot fail to win admiration anywhere—except perhaps in fallen India.

Greater India.

Mr. Bhai Paramanand, in an article on "Greater India" in the *Modern Review* for February, points out that the once great India fell down because it shut itself within its four walls, and lost the healthy competition resulting from a constant touch with the world beyond.

In British India, foreign education has been a chief impetus to those of the higher classes travelling abroad. Following their example, men of lower means have gone out to Japan or America and tried to earn their living there. But there is a class of Hindus who have done something of real colonisation. One division is that flourishing in East Africa. Other sections are to be found in the different states of United South Africa and the Transvaal. Another section is in the West Indies and South-America. British Guiana is perhaps the only place where the Indians have got all political privileges. Still another section is in the colonies of the Pacific Ocean.

In conclusion, I appeal to all young men in India to go abroad in ever increasing numbers. There is no national progress without foreign travel. Sea-sickness is the best national tonic. And it is our duty to help, enlighten and encourage our brethren across the seas. Greater India has arisen without noise of drum or trumpet, under the palm-trees of tropical America and on the snow-girt plains of Canada. It is time to take stock of our position and think in terms of a universal Hindu consciousness. The children of these colonists should be educated along national lines. They should be taught Hindu history, and Hindu institutions should be established and preserved wherever the Hindus live. The Ramayana and the Gita should follow the footsteps of Hindu emigrants. We can thus save our young men abroad from absorption in the Christian community. They are converted to Christianity only for social reasons and not for the sake of their souls. The development of the social machinery of Hinduism in their midst is the great remedy for this evil.

Enterprising young men should learn some lucrative art or industry before venturing out in the broad world. Medicine, pharmacy, carpentry, bricklaying, signpainting, watch making and the arts of the goldsmith and ironsmith, are all useful vocations that will enable a person to earn his livelihood anywhere. A small amount of capital will also set up the owner in retail trade in any town.

Buddhism in Western Thought.

Jeno Leonard writing in the *Buddhist Review* for the first quarter of 1912, on "Buddhism in Western Thought," reviews the progress of the various religions of the world as they flourish today. The teaching of Christianity is so full of absurdities contradictory to all sense and knowledge that it cannot long continue to possess a hold on humanity.

In spite of lavish expenditure and zealous work, Christian missionary effort is practically sterile, even under the most favourable conditions, namely, amongst uncivilised and uncultured peoples. We see that the political power, which the churches have won for themselves, lasts only so long as the intellectual force of their leaders can maintain their forlorn fight against the ever-increasing flood of infidelity, and, so soon as the mental and moral grip is lost, Saint, Pope and Priest go the same way as the gods of Olympus and Walhalla. The extinction of Christianity is but a matter of time.

Buddhism is indeed on a different and national basis in so far as Buddha does not occupy in it that absurdly marvellous place which is assigned to Christ in Christianity. It is seen with the progress of knowledge that there is an unmistakable connection between Buddhism and Agnosticism, Free Thought, and Modern Science. Buddhism supplies to these forms that solidarity which a Religion naturally possesses.

Evolution and Periodicity are the lights of Science and of Buddhism; *Solidarity* with the aims and sufferings of others is the leading idea of Socialism and also of Buddhism. The idea of doing good is gradually becoming divorced from belief in a special distribution after death in Heaven and Hell; the world is beginning to do good for its own sake. The law of absolute causality is spreading far and wide, and the idea of an Omnipotent Being, God, Trinity or Power, distributing eternal bliss or punishment, is fading away from an intellectual world.

The Appointment of Judges in India.

Mr. J. D. Anderson, late of the Civil Service, examines the question of the appointment of Indian Judges in the pages of the *East and West* and comes to the following conclusion:—

It must be remembered that the Indian judicial service is one of the largest in the world. It is not to be supposed that any system of selection would make all the Judicial officers into Solons. No doubt, like all other persons with fixed salaries all over the world, their prospects have suffered by the fall in the purchasing power of money. But looking to the special circumstance of Indian life, has it been proved that a system of selection based on indigenous methods and tried by long experience has proved so complete a failure as to justify a resort to experiments based upon the practice of distant and widely different countries, or, as some suggest, a recourse to those members of the English bar who, for one reason or another, have not chosen to face the ordeal of the open competition? Is it really a fact that the judicial branch of the Civil Service is the refuge of its least competent members? Even if some district judges have betrayed some ignorance of the formal law whose bulk tends to grow as fast as the accumulations of worthless books in public libraries, may not the proper remedy be a reconsideration of the proper uses of codified law, and perhaps an enquiry into judicial practice in countries such as France and Germany, where codes do the work of our formless common law? Is it really necessary, in an agricultural country like India, to add an enormous mass of judge-made law on English models to the local customs and usage? Finally, will not judges nurtured wholly on English law and equity be naturally inclined to add to the importation of European laws and incidents of law instead of studying the people and their needs and primitive conceptions of justice?

Indians in the State Service.

Mr. Jotaylal Sharma writing on "Indians in the State Service," in the *Hindustan Review* for February voices once again the long standing grievance against the injustice done to the children of the soil in the matter of filling up State appointments, as the result of the ever illiberal policy of the Government. There is not much need to point out the unequal treatment in general which Indians receive under the British Government.

The assault cases, the unwritten social laws, the avowed and unavowed political heresies, the fetish of prestige and the service rules, all illustrate, silently yet eloquently, in a manner which cannot be misread or misunderstood, how the superiority of the Britisher and the inferiority of the Indian, are preserved and maintained by the zealous, watchful, uncompromising Government.

The Court of Directors had voted as far back as in the thirties of the last century against the maintenance of a governing caste in India. But this has been set aside by their wiser successors. Even Lord Lytton confessed that both the Governments of England and India "had broken to the heart the words of promise they had uttered to the ear." Nowadays we hear of "reorganisations" resulting in the abolition of half a dozen posts on Rs. 40 each giving place to a preserve on Rs. 400 for an Anglo-Indian or Eurasian. From the enquiry made by Lord Curzon it was seen

that only 71 per cent. of the posts on Rs. 1,000 and over were held by Indians. Since Lord Curzon's time the situation has slightly improved. On the contrary, excepting one or two higher appointments given to Indians, new rules have been framed which keep out Indians of unquestioned merit and ability from the Public Works, Survey and Customs Departments in particular. Hardly 9 per cent. of appointments carrying a salary of Rs. 1,000 and upwards are held by Indians, and yet we hear of the preposterous claim put forward by officials and their apologists that great liberality is being shown in the matter.

Only 4 out of 177 posts are held by Indians in the *Indian Educational Service*. Royal commissions of enquiry never prove effective in remedying popular grievances: In the words of Mr. Winston Churchill:

They are usually appointed with a desire to hang up a subject, to stifle a popular demand by battering it down under a mass of blue-books

The reforms wanted in the public service to better equalise the balance have been indicated by Mr. Subba Row.

In the first place, the monopolisation of the higher posts by one class of people has got to be checked; next, more sparing use of nomination, if not its total abolition, thirdly, better distribution of officers over the different provinces, fourthly, the raising of the Provincial Service and the removal from it of the stigma of inferiority, and provision of promotion on well-understood principles from one service to a higher one. Further, the scale of pay, in the lower grades, requires to be raised in view of the increased cost of living. Rs. 50 is not enough for an Indian clerk. If the Anglo-Indian eats and dresses himself well and lives in a better style, the Indian has to support more dependants than the Anglo-Indian has any idea of, and with the pay he gets he is always on the verge of bankruptcy and starvation. Such a state of things should be allowed to continue no longer, and it is due to the dissatisfaction noticeable among Indians. Better treatment, also they deserve and have a right to expect, but has not been accorded to them. The throwing open of Forest, Opium, Customs and Railway services, both in the higher and lower grades, is another crying need.¹

Coronation Concessions In India.

Sir John Rees in the *Fortnightly Review* for February criticises the recent Durbar concessions from the ultra-conservative point of view. In his opinion the reversion of the partition of Bengal and the change of the seat of Government from Calcutta to Delhi are both unwise and likely to be harmful. The former he calls a weak surrender to the Bengali agitators and the latter an unwise and expensive step "Calcutta in fact is, and Delhi never can be, except in name, the capital of modern India"—such is the dictum of Sir John Rees.

QUESTIONS OF IMPORTANCE.

Educational Progress in India.

(Figures for the last five years.)

AN INCREASE OF A MILLION SCHOLARS.

A statistical statement is published in the *Gazette of India*, showing the educational progress made in India and in the several provinces during the years 1906-07 to 1910-11. The principal figures for all India are as follow :—

	Popula- tion.	Total Scholars.	Total Expen- diture.*
1906-07	.. 241,264,908	5,388,632	5,59,04
1907-08	.. 242,819,633	5,699,146	6,01,59
1908-09	.. 242,820,305	5,972,204	6,58,48
1909-10	.. 241,717,588	6,203,305	6,86,76
1910-11	.. 254,820,616	6,346,582	7,18,68

* In Thousands of Rupees.

	Male Scholars	Female Scholars.
1906-07	.. 4,183,041	561,439
1907-08	.. 4,428,175	647,786
1908-09	.. 4,650,131	720,342
1909-10	.. 4,826,554	763,580
1910-11	.. 4,930,084	793,646

The principal figures for Bengal and Eastern Bengal and Assam are as follow :—

BENGAL.

	Popula- tion.	Total Scholars.	Expen- diture.*
1906-07	.. 54,662,529	1,215,014	1,16,63
1907-08	.. 53,771,914	1,288,541	1,25,56
1908-09	.. 53,772,586	1,369,280	1,44,58
1909-10	.. 52,669,669	1,422,419	1,50,89
1910-11	.. 55,023,340	1,463,828	1,60,71

* In Thousands of Rupees.

E. B. AND ASSAM.

	Popula- tion.	Total Scholars.	Expen- diture.
1906-07	.. 30,788,134	815,599	51,24
1907-08	No change	880,631	58,29
1908-09	No change	953,123	66,34
1909-10	No change	954,883	65,94
1910-11	.. 34,594,362	984,213	73,05

In Madras Presidency, the number of Primary Schools for males was 23,426, and 900 for females in 1910-11. The total number of scholars, both

male and female, in all institutions was 1,215,725. The total expenditure was Rs. 1,27,68,000 in 1910-11 against 97,64,000 in 1906-07.

In Bombay Presidency, the number of public institutions for males was 11,267, and for females 1,121, in 1910-11, and the total number of scholars, both male and female, in all institutions was 868,535 in 1910-11 against 720,547 in 1906-07. The total expenditure was Rs. 1,24,00,000 against Rs. 1,06,43,000 in 1906-07.

In the United Provinces the number of primary schools was 9,067 in 1910-11, against 9,545 in 1906-07. The total number of scholars, both male and female, in all institutions was 645,787 in 1910-11, against 606,174 in 1906-07. The total expenditure was Rs. 93,39,000 in 1910-11, against Rs. 74,90,000 in 1906-07.

In the Punjab the number of primary schools was 3,321 in 1910-11; the total number of scholars both male and female in all institutions was 346,940; and the total expenditure was Rs. 60,57,000 in 1910-11, against Rs. 51,97,000 in 1906-07.

In Burma the number of primary schools was 4,895 in 1910-11, against 4,950 in 1906-07. The total number of scholars in all institutions for male and female was 429,992 in 1910-11, against 398,598, and the total expenditure was Rs. 45,63,000, in 1910-11, against Rs. 34,87,000 in 1906-07.

In the Central Provinces and Berar the number of primary schools was 3,094 in 1910-11; the number of scholars both male and female in all institutions was 297,620; and the total expenditure was Rs. 30,85,000 in 1910-11, against Rs. 22,48,000 in 1906-07.

In the North-Western Frontier Provinces the number of primary schools was 264 in 1910-11, and the total number of scholars both male and female in all institutions was 31,891, in 1910-11, against 4,865 in 1906-07. The total expenditure

was Rs. 3,88,000 in 1910-11, against Rs. 2,38,000 in 1906-07.

In Coorg the number of primary schools was 81 in 1910-11, and the total number of scholars both male and female in all institutions was 6,610 in 1910-11, against 4,865 in 1906-07. The total expenditure was Rs. 92,000 in 1910-11, against Rs. 49,000 in 1906-07.

Details are also published regarding the number of high schools and arts colleges and public institutions for males and females in all the provinces.

The Recent Changes and the Mussalmans

BY HIS HIGHNESS THE AGA KHAN, GCSI, GCIE

The recent changes came so suddenly that it is not strange that the Mussalman public should have hesitated in deciding how it should receive them. That they will have considerable effect on Islam's future destiny in India is an evident truism. Yet I doubt if there be a single individual, outside the small circle of the authors of these changes, who has not passed through different emotions since he heard the Royal announcement.

I, for one, however, after a careful consideration of every aspect of the question have come to the conclusion that the Mussalmans do not lose anything of consequence, while India as a whole and the Empire will gain considerably. The gain of India must be the gain of the Mussalmans of India, provided no direct Moslem interest is attacked. We must take the changes *seriatim*, look at their probable results, and determine how India, and then the Mussalmans of India, will be benefited, or otherwise, by each. The change of capital in itself will have the great advantage for Mussalmans of bringing the Government of India nearer to the centres of Moslem intellectual activity and to the most virile portions of the Moslem community in India. It will, in the next place,

bring the Viceroy nearer to the Moslem University, an institution in the welfare of which as the Chancellor of the University he is directly interested. For India as a whole it will be a great gain that the seat of Government should be, so to speak, in a neutral and central position, and removed from any great section of people or province that may have interests of its own not identical with or always friendly to those of other equally great and important sections of people or provinces. For Calcutta, with its great commerce, and tapping as it does the richest 'Hinterland' of Southern Asia, it cannot be anything more than the loss of the social attractions of the Government House.

Then comes the undoing of the Partition. No doubt the Mussalmans were in a distinct majority in the province of Eastern Bengal and Assam, and this unique position is now lost. But looking at the position of Islam in India as a whole, I doubt if it will be found that it was a good thing to be in a clear majority in one province and in a minority in almost every other. The disadvantages of such a situation are obvious. Islam in India is one and indivisible. It is the duty of a Moslem to look not only to the immediate interest of his own locality but to those of his co-religionists as a whole. But if we look upon it from a still wider point of view as Indians we shall find that the old Partition had deeply wounded, and not unnaturally, the sentiments of the great Bengali-speaking millions of India. Anything that permanently alienates and offends the sentiments or interests of millions of Indians, be they Moslem or Hindu, is undoubtedly in itself an undesirable thing and should not only be avoided by the Government but also opposed by all communities of India. Viewed in this light, the undoing of the Partition which has satisfied the great Bengali-speaking people, ought to be in itself a cause of congratulation for all Indians, whether Hindus

or Mussalmans, and I think we should all be deeply grateful to His Excellency Lord Hardinge for this great act of statesmanship which has removed a grievance from one important section of His Majesty's Indian subjects. From the point of view of the greater good of India and the Empire, the removal of the capital and the undoing of the Partition, or rather, the creation of two new Provinces, have been masterstrokes of statesmanship.

But there still remains the question of the real needs of the Mussalmans of Eastern Bengal and Assam. These needs can all be summed up in one word,—'Education.' However, since Lord Hardinge's Government has promised a University for Dacca—a University that we most sincerely hope will be a teaching and residential one—I doubt if there is left unredressed any real grievance of the Mussalmans of Eastern Bengal, provided, of course, that the new Government of Bengal, sees to it that the recommendations of the Education Commission of 1882, are carried out both in the spirit and the letter. For with facilities for education provided in that province, the Mussalmans can raise themselves to a position in which it will be impossible for anyone to deprive them of what is rightly their due. Some have no doubt asserted that the new University will perhaps compete with the great Moslem University at Aligarh. Nothing could be more absurd. For the great Moslem University is to be a central residential institution of the *elite* of the community, while the other is to help forward all those who might be left behind in the race of life by the supersession of Dacca by Calcutta. Competition between two such different institutions would be as absurd as a race between a bird and a fish. Calcutta and India as a whole will also gain educationally, for no University can be really efficient that has to cater for a population of over 100 millions and rush through more than 8,000 examinations. It must necessarily become mechanical.

So resuming the facts, we can put the gains as a neutral and central capital, the satisfaction of the sentimental grievance of the great Bengali nation, and the protection of the only real interest of the Moslems of Eastern Bengal. The loss comes to be limited to the loss of the social importance of Calcutta, but neither the loss of its trade nor of its prosperity.

Under these circumstances, I feel it my undoubted duty to advise my co-religionists to welcome the changes and be grateful to the Government that has initiated them. The need for this is all the greater since the Mussalmans will thus show their real and sincere sympathy with their Hindu brethren of Bengal and their readiness to respect Hindu and Bengali sentiment. Are not the feelings animating the promoters of the Hindu and Moslem University schemes those of fraternal and healthy rivalry? And above all, by working for the success of these great changes loyally, whole-heartedly and without any *arrière pensées*, Moslems will best prove their loyal devotion to their gracious and beloved Sovereign, the King-Emperor, and their loyal appreciation of the sympathetic Government of Lord Hardinge that has removed the great sentimental grievance of the Bengalis and has yet protected, by promising a University of Dacca, all the real interests of the Moslems of Eastern Bengal.

SANKARAS SELECT WORKS.

Sanskrit Text and English Translation.

By MR. S. VENKATARAMANAN, B.A.

CONTENTS.—Hymn to Hari; The Ten-Versed Hymn; Hymn to Dakshinamurti; Direct Realisation; The Century of Verses; Knowledge of Self; Commentary on the Text; Definition of one's own Self.

PREFACE.—The main object of this publication is to present, in simple English, some of the works of Sri Sankaracharya in which he tried to expound, in a popular style, the philosophy of the non-dualistic Vedanta of which he was the well known founder. With this view, the present translation has been rendered free of technical words and phrases. It is hoped that the juxtaposition of the Sanskrit-text and the English translation will serve the double object of enabling the student of Sanskrit to understand the text better and to correct, by a reference to the text, any defect of expression in the translation as an inevitable result of the attempt to put it in a popular style. To those that have had no training in metaphysics or dialectics and have neither the leisure nor the capacity to read the original standard works of Sankara, a publication of this kind should be specially helpful for a proper understanding of the broad outline of Sankara's philosophy of non-dualism.

Bound in Cloth. Price Rs. 1-8.

To Subscribers of the "Indian Review," Rs. One.

G. A. Natesan & Co., Sankurama Chetty Street, Madras.

UTTERANCES OF THE DAY.

Mr. Llyod George on "Poverty."

[EXTRACT FROM A RECENT SPEECH.]

What did poverty mean? It was not that men were deprived of luxuries, it was not that men were deprived even of the comforts of existence, it was that they had not enough to purchase the barest necessities of life for themselves and their children. According to Mr Rowntree, one fourth of the population of this country, even in times of prosperity, were living under conditions of poverty thus defined. Was it because the country could not maintain them, or because the land was poor? The national income was 1,800 millions. That was the revealed income (laughter), and that meant £200 a year for every family. Yet one third of that income was received and spent by 250,000 people, one 200th part of the population of this country, or, in families, one fortieth of the population was receiving and spending one third of the income of the country. Poverty was not here because there was not abundance.

It was incumbent upon those who had been blessed by Providence to make sacrifice for others. That was said to be talking Socialism, to be setting class against class. Let us get rid of these cockatoo phrases which are repeated from mouth to mouth by the unthinking, after getting them from people whose brains are just as shallow and whose vision is just as limited as their own. (Cheers) Let us get to the real, terrible, human, living facts writhing and seething below; let us tear from this pit of wretchedness its flimsy covering of phrases so as to reveal that mass of human agony, with the help and sympathy of those able to help. (Cheers) Let us say it is the business of the Churches to insist upon the facts being known, upon every man realising his own responsibility, upon every man realising

that he has got to sacrifice in order to help. (Cheers)

It is idle to attempt to deal with a colossal problem of this kind unless those who are well to do are prepared to make great sacrifices. *The great lesson of Christianity is this; you cannot redeem those who are below except by the sacrifice of those who are above.* (Cheers) *You cannot touch any evil in this country without finding that there are interests that have struck their roots deep into it and are flourishing even upon its very putrescence. Attack it and you bring upon yourself, not unpopularity—that is not what you have to face; you have to face a very hailstorm of abuse, insult, calumny. Help men who are fighting* (Cheers)

Sir George Clarke on Nationalism

In the course of a speech delivered on the occasion of the last annual convocation of Bombay, Sir George Clarke, the Chancellor, made a pointed reference to the question of nationalism in India. Said His Excellency

"If you are earnest workers and thinkers you need have no fear that you exercise too influence in the political sphere, while in all other spheres there are unbounded opportunities for work. The national idea is wholly foreign to India. It has been planted on Eastern soil as one of the results of Western learning, and the assimilation of Western thought which the universities of India have promoted. It is a high aspiration which I hope all you young men will cherish. There is not one of you who cannot do something towards its realisation by setting an example of the spirit of brotherhood, by acting not as members of caste and communities, but as citizens of India, and by putting the general good foremost in your aims. But, remember that it is to British rule that you owe alike the idea of common nationhood 'the stirring of new life,' to which His Majesty referred, and the possibility of gradually melting your diverse people into an Indian nation fit for self government."

INDIANS OUTSIDE INDIA.

Prohibition of Indentured Labour.

Calcutta, 4th March.—The Imperial Legislative Council began at 11 A.M., there was a fair attendance.

THE HON. MR. GOKHALE.

The Hon. Mr. Gokhale, moving the Resolution for the prohibition of indentured labour, began by recalling the fact that two years ago the Council adopted a Resolution recommending that the Governor-General in Council should obtain powers to prohibit the recruitment of indentured labour in India for Natal. The Government, who accepted that recommendation, gave effect to it by carrying through the Council the necessary empowering legislation, and on the 1st July last year, the new Law was put into operation. Mr. Gokhale now invited the Council to go a step further and recommend the abolition of the system of indentured labour altogether. It was true that the Resolution of two years ago was adopted principally as a measure of retaliation, rendered necessary by the continued indignities and ill-treatment to which their countrymen were subjected in South Africa, but Mr. Gokhale's own view expressed in the Council, even then, was that apart from the question of retaliation, indentured labour should be stopped, because it was wrong in itself.

It was unnecessary to describe at any length to the Council what the system of indentured labour really was.

Its principal features were, roughly, six. Those who were recruited under that system bound themselves first to go to a distant and unknown land, of which they had no idea of the language, life, customs and usages, of which they were totally ignorant and where they had no friends or relations. Secondly, they bound themselves to work there for any employer to whom they might be allotted, whom they did not know personally and who did not know them and in whose choice they had no voice. Thirdly, they bound themselves to live during the period of indenture on the estates of their masters, unable to absent themselves or even to go on short visits without a special permit and compelled to do such tasks as might be assigned to them, however arduous they might be. Fourthly, they bound them-

selves to belong to their masters for a period—generally five years—during which they had no power to withdraw voluntarily from the contract. Fifthly, they bound themselves to work for a fixed wage during the time, which was invariably lower and in many cases very much lower than that paid to free labour around them; and sixthly, and lastly, and that was the worst feature of the system, they were placed under a special Law never explaining to them before they entered into agreement, which threw a criminal liability on them for the most ordinary breaches of the contract, in the place of the Civil liability usually attached to such breaches. Thus under that Law they were liable to imprisonment with hard labour, not only for fraud, not only for deception, but for negligence or carelessness, and, would the Council believe it, even for an impertinent word or gesture to the employer or his overseers.

Those were the main features of the system, and when in addition they remember that the victims of the system generally belonged to the poorest classes of this country and that they were induced to enter into the contract, or rather entrapped into doing so, by the unscrupulous representations of wily professional recruiters, who were paid so much ahead for the labour they supplied, and whose interest in the persons recruited ended with handing them over to Emigration Agents and receiving their money.

They could not hesitate to regard the system as a monstrous system, iniquitous in itself, based on fraud and maintained by force. Nor could they demur to the statement that a system so wholly opposed to modern sentiments of justice and humanity was a grave blot on the civilisation of any country that tolerated it. If the Council glanced briefly at the origin and history of the system, they would be struck by three facts. First, that indentured labour was brought into existence, as stated by the Sanderson Committee and other authorities, to take the place of slave labour, when slavery was abolished. Secondly, even the emancipated Negroes scorned to come under that system under which, however, the free people of India were placed, and thirdly, the Government had a very uneasy conscience in the matter, as was clearly shown by numerous inquiries ordered from time to time into the working of the system, its repeated suspensions owing to serious abuses and its resumption under pressure from planters. Mr. Gokhale drew the special attention of the Council to a debate in Parliament, that took place more than seventy years ago, in the course of which Lord Brougham and other great Englishmen denounced in strong terms the system of indenture, a debate which was followed by the suspension of the system and an inquiry into its nature.

After referring to other inquiries, Mr. Gokhale proceeded to consider in greater detail the main objections to the system. The first was necessarily its utter iniquity. The stream was poisoned at the source. The lying representations of professional recruiters, for whom no one had a good word to say, alone succeeded in enticing the poor creatures who entered into agreements out of the country. Again, the penal nature of the contract, which was its worst feature, was carefully kept from the emigrants when they signed their agreements. Mr. Gokhale deemed it necessary to complain strongly about this, because if the fact of penal liability was sufficiently known in the districts where the recruitment took place, the profession of the recruiters would be gone. To dignify such a transaction by the

name of contract was to misuse the English language. In several legislative enactments passed in this country, such as the Decree on Agriculturists Relief Act, the Government assumed, and very properly assumed, that a so-called contract between two parties very unequally matched had to be carefully looked into before it was enforced, and that the same principle should apply to the contracts of indenture. It was urged by the apologists of the system that safeguards were provided against abuses in that there were *Protectors of Immigrants* in the different Colonies, and that there were the *Magistrates* to give the labourers the protection of Law against the employers. Those safeguards, however, were largely illusory, as the *Protectors* and the *Magistrates* were the officers of the Colonial Governments belonging to the same class as the planters themselves, and generally one in sympathy and interest with them. Then, they had to remember that the system during the seventy-five years of its existence had to its discredit a vast and terrible amount of suffering. The imprisonments with hard labour for trivial causes, the physical violence endured by many without any chance of redress, the bitterness of finding themselves entrapped, the home-sickness destroying all interest in life, the heavy preventable mortality on the estates, the large number of suicides, and the unutterable tragedy and pathos of men and women knowing that the vast sea rolled between them and their native place starting actually to walk back to their country, imagining in their simplicity and ignorance that some land route could be found, and either seized and forcibly taken back or else devoured by wild beasts or perishing of hunger and cold. All that constituted a sum of human misery appalling to contemplate and bearing witness against the system for all time. It was true that things were somewhat better now, but that could not obliterate the past and, moreover, there were limits beyond which, owing to its inherent character, the system could not be improved. Further, as Lord Curzon pointed out in this Council in 1901, a system under which such things could occur, even in exceptional cases, was a system that stood condemned and could not be justified.

The next objection to the system was the frightful amount of mortality inseparable from it, as the Government of India themselves had admitted. The sex problem was in some respects the most difficult problem connected with the system. The Sanderson Committee, which had dealt with several phases of indenture, had carefully avoided making any suggestion as to how the sex problem could be reduced for the reason that there could be no remedy for it. As long as the system lasted under the Law every hundred male emigrants must be accompanied by about forty female emigrants and as not many respectable women could be persuaded to go those long distances the number was made up by including in it women of admittedly loose morals, with results which might better be imagined than described. The last objection that Mr Gokhale urged against the system was the rational degradation involved in it. Wherever that system prevailed the Indian, no matter what his position was, was a mere coolie. It was bad enough that serious disabilities attached to their position in their own country, but they certainly had a right to ask that that additional brand should not be put upon their brow before the rest of the civilised world.

Turning to the arguments in favour of the system, Mr. Gokhale said that they were three in number. First,

that without such indentured immigration the sugar and other industries in some of the Colonies would perish; secondly, that owing to such emigration a number of Indians were able to remit considerable sums of money to India, and thirdly, that some of the emigrants after attaining freedom settled in the Colonies, prospered and attained a status which they could not have attained in this country. Of those arguments, Mr. Gokhale dismissed the first as not concerning them at all. As regards remittances made to India, the amount was really very small. Lastly, even if it was true that a certain number of Indians settled in the Colonies and prospered after completing the indenture, the fact that they had to go through a period of indenture with its attendant degradation and misery alone sufficed to show that such advantages as accrued were too dearly purchased.

Mr Gokhale proceeded to describe briefly the extent to which the system at present existed. After referring to the Colonies where it once flourished and now ceased he pointed out that indentured labour now went to three British Colonies, namely, British Guiana, Trinidad and Jamaica, and one Dutch Colony, Surinam in the West Indies, one Crown Colony, Fiji in Australasia and to certain districts of the Upper Assam Valley. There was also a small supply of such labour to the Straits Settlements. Of these the Government themselves, Mr. Gokhale understood, had decided to discontinue the system in Assam from July next year, and he strongly urged that the same course should be adopted in regard to the Colonies mentioned by him. In addition to that, there was the question of re-indenture in Natal and Mauritius, for which indentured recruitment had been stopped, and in Fiji for which it was still allowed to continue. Unless re-indenture was stopped, large numbers, by being driven continuously to recontract themselves, owing to sheer helplessness, would be doomed to what was semi-slavery for the greater part of their lives. In particular, Mr Gokhale drew the attention of the Council to the £3 licence tax which was exacted annually in Natal from every male above 16 and every female above 13 who had completed their indentures since 1901. Mr Gokhale deemed it his duty to denounce the tax as a diabolical device either to keep the indentured population in a state of perpetual servitude, or else drive it out of the country.

In conclusion, Mr. Gokhale appealed to the Government, to realise the full measure of their responsibility in the matter. The Government, no doubt, had done a great deal from time to time to soften the horrors and mitigate the hardships of the system, but there was no question that the only way really to improve the system was to improve it out of existence. The conscience of the people of India was waking up to the iniquities of indentured labour and the degradation involved in it, and he asked the Government not to make the mistake of ignoring what was due to their national self respect, the call of humanity, and he was confident that a people that had spent millions and millions in emancipating slaves all over the world would not long tolerate the continuance of a system which condemned their own fellow subjects to a life, if not of actual slavery, in any case, one bordering on semi-slavery.

THE HON'BLE SIR V. D. THACKERAY.

The Hon'ble Sir V. D. Thackeray, in supporting the Resolution, said that indenture was tantamount to converting a free man into a practical slave, and as such was an outrage on humanity. There was plenty of scope

for any amount of labour in India, and he maintained that there was nothing in the conditions, including payment of labour in India, to justify a resort to indenture to send away labour out of India. Even in China there was no system of indenture, and it was regrettable that the indenture system should prevail in India alone.

THE HON'BLE MR. FREEMANTLE.

The Hon'ble Mr. Freemantle said that he was a member of the Sanderson Commission appointed to enquire into this subject, and that in the course of that inquiry he visited a large number of labour recruiting districts and took the evidence of a large number of witnesses. He reviewed the work of the Commission and the evidence taken by it, and said that the Commission came to the conclusion that the system had not oppressed or inflicted any hardship upon the emigrants, who were generally found to be prosperous. He had questioned large numbers of returned emigrants, and found that none of them had gone out without knowing the penal nature of the contract to which Mr Gokhale had referred. They all had friends or relatives who had been to the Colonies, and knew the conditions of life and work.

The Hon'ble Mr. Gokhale —It is not in the agreement.

The Hon'ble Mr. Freemantle —It is not in the agreement certainly, but they know perfectly well the nature of the contract.

Mr. Freemantle referred to the work done by Protectors of Emigrants and to the fact that during the last few years the quantity of the land held by Indians had increased from 6,600 to 42,000 acres. Similar conditions prevailed in other Colonies, and the emigrants generally were very well off.

THE HON'BLE MR. SHAHI.

The Hon'ble Mr. Shah said that Mr. Freemantle had referred to the Protectors of Emigrants, but it had been shown that they were very often protectors of the interests of the planters, rather than protectors of the emigrants. The Mahomedan community was unanimously in favour of the Resolution.

OTHER SPEAKERS.

The Hon'ble Sir Gangadhar Chitambar also supported and said that the system of indentured labour was antiquated, and was not required.

The Hon'ble Mr. Subba Rao appealed to the Government not to run counter to the sentiments of the people.

The Hon'ble Mr. Haque asked the Government to save their honour.

The Hon'ble Mr. Mudholkar and the Hon'ble Nawab Abdul Masud supported the Resolution. The former asked the Council not to make India a recruiting ground for the Colonies.

The Hon'ble Pandit Madan Mohan Malaviya condemned the system on humanitarian and national grounds, and said that the system could not have come into force but for the Government.

The Hon'ble Malik Omar Hyat Khan supported the Resolution, and asked how indenture was undesirable as regards Natal, it was desirable elsewhere. He emphasised the absolute unanimity of Indian opinion on the matter, and said:—"When cent. per cent. of the population are agreed the Government should be on our side or else you won't be our Government."

THE HON'BLE MR. CLARK.

The Hon'ble Mr. Clark, in reply to the debate, said:—Mr. Gokhale had argued his case with a vigour and

eloquence which they were accustomed to get from him in the Council. With much that Mr. Gokhale had said he was in sympathy, although he disagreed with them.

The Resolution fell into two parts. It dealt with indentured labour in India and immigration to the Colonies. In India the indentured system survived in four or five Districts in North Assam and there it was moribund, under sentence of death. The condition of the colonies in Assam was good. They were well looked after and lodged and supplied with good water and were able to earn money above their pay, but the primary reason for the abolition of the indentured labour in Assam was the malpractices that prevailed. Turning to what was under the circumstances the most crucial question of indentured emigration for British Colonies, Mr. Clark said that they should have an idea as to what the scope of that emigration was. The Colonies included British Guiana, Fiji, Jamaica, Trinidad and Mauritius. As regards the Straits Settlements, the greater part of the emigration had been free, and the system was practically dead there. In the Malay States, where the greatest mortality occurred, it had been stopped. In Ceylon it was practically free. As regards British Guiana, there was a small number of the unemployed, and emigration was practically dead there. With regard to other free Colonies in the West Indies there was a flow of emigration, and they must consider the principal obligations imposed upon the employers and on the coolies, respectively, by the Emigration Law of the different Colonies themselves. The coolie had to serve an indenture of five years, live on the plantation, and, if he left it without a pass from his employer, was liable to arrest without a warrant. If the coolie exceeded his leave or deserted, he was liable to imprisonment or fine, or both. Similarly, he was also liable to imprisonment or fine for refusing to go to hospital, refusing to work or inciting others not to work. Nobody was allowed to recruit, unless he held a certificate from the Protector of Emigrants at one of the Ports to which the coolie went, while the recruiter had to give the coolie a printed form or a true copy of what the actual terms were. The question was whether the coolie knew about the penal provisions which, as a matter of fact were not mentioned in the contract. That was a point on which he proposed to have an enquiry made. There was a great deal of force in the fact that the coolie ought not only to know the actual conditions and actual requirements of the work, but also the express terms of the penalties in case he infringed his contract. The coolie in India was generally tied down in some form or other, while the coolie going to Ceylon was also bound down by a small debt. The assumption was, after all, that when a man entered into a contract, he meant to carry out that contract. Mr. Gokhale's assumption was that the coolie did not know of the penal conditions, and that when he got to the Colony and found them out he wanted to get back. That was not a fair way of looking at it. It was not a great hardship that when a coolie went to the Colonies and refused to work he should be punished. With regard to the obligations placed on the employer, the coolie was recruited under a certain form of contract before a Registering Officer who was required to take him apart and see him privately in order to make sure that he really understood the terms of the contract. The coolie was then taken to the Depot, examined by a Doctor to see whether he was healthy, or whether there was anything wrong about him. If the Doctor was satisfied, the coolie was placed on board the ship, looked after in

FEUDATORY INDIA.

The Gaekwar on Sedition.

The following Huzur Order, signed by H. H. the Gaekwar of Baroda, dated the 27th February, is published at Baroda :—

"I have recently had under my consideration the result of the enquiry held into the discovery of copies of a certain seditious book at Naosari. The author of the book has been dealt with by a separate Order, and the Press in which it was printed has been confiscated. In connection with that enquiry, however, I have been painfully surprised to know that there has been within my territory certain persons who openly or secretly sympathised with the author and a few others who were believed to entertain feelings of disaffection to the British Government. I, therefore, take this opportunity of expressing in the clearest terms my strong disapprobation of such writings and feelings and my firm determination to punish and suppress sedition in any form wherever found within the limits of my State. The interests of Native States are inseparably bound up with those of British India, and all persons who conspire to subvert the Government in one offend equally against the other. The maintenance of the cherished relations of true friendship and good understanding which have uniformly existed between the Baroda State and British Government has unceasingly claimed my anxious attention, and the preservation of peace and order and the advancement of the material, intellectual and moral well-being of my people which has been the constant aim of my Line are dependent on the maintenance of those cordial relations, and any attempt within the limits of this State to disturb those relations will meet with my entire disapproval and will be repressed with a firm hand.

Far be it from me the wish or intention to

restrain the legitimate freedom of the Press or to restrict the scope of fair and well-informed criticism. But the breath of political unrest which disturbed British India a short time ago will not be allowed to ruffle the tranquil bosom of this State. Laws have, therefore, had to be enacted which had heretofore been deemed unnecessary, and however much I may deplore the circumstances which rendered such legislation necessary, I wish to declare my intention of vigorously enforcing such Laws against all evil-minded persons who infringe their wholesome provisions. I, therefore, enjoin all my officers, in places high or low, and my subjects of all classes and creeds whose welfare and happiness is nearest to my heart, to co-operate with me loyally in stamping out every vestige of disaffection to the British Government, wherever found and in maintaining relations of good-will and sincere friendship between the *British Government and mine*, and in regarding as an enemy to order and good government every misguided person who attempts to excite feelings of ill-will, hatred or contempt against the British Government."

Mysore Industries.

We take the details below from the Mysore Administration Report for 1910-11 :—Excluding gold, the principal exports during the year were arecanut, coffee, cardamoms, food grains, hides, jaggery, cotton and silk; and the principal imports, food grains, yarn, dhal, piecegoods, wheat, *chillies*, *kerucene oil* and salt. The value of imports was Rs. 2,83,89,215 and that of exports, excluding gold, Rs. 4,23,98,467. Fifteen mining companies were at work during the year, 10 for gold, 3 for manganese and 2 for mica.

The chief gold producers were the Mysore, Champion Reef, Ooregum, Nundydrug and Balaghat mines and the returns from the first three mines were satisfactory.

The total quantity of gold produced during the year under report was 547,866 oz. approximately estimated at Rs. 3,14,83,742 against 552,857 oz., estimated at Rs. 3,17,92,810. Comparing the output of gold for 1910-11 with that for the previous year, there was an increase of 7,897 oz. in the Mysore and Champion Reef mines and a decrease of 12,887 oz. in the Oregum, Nundydrug, Tank block, Balsaghat and other mines.

The royalty due on the gold obtained during the year under report was approximately Rs. 17,80,276, against Rs. 15,90,242. The increase in royalty is due to the receipt, during the year, of 2½ per cent. of dividends paid by certain gold mining companies in accordance with the terms of the new leases held by them.

There was no improvement in the price of manganese, and the industry in this mineral therefore continued in a depressed condition. The following statement shows the approximate quantities of ore obtained and sold and royalty realized thereon:—

Year.	Tons extracted.	Tons sold.	Royalty. Rs.
1909 10 .	37,843	29,755	16,883
1910 11 .	28,265	17,980	7,577
Decrease .	9,578	11,795	9,306

The chrome industry during the year shared the same fate as that of manganese and did not therefore offer any encouragement to the licences for pursuing the business. Consequently no ore was extracted from any block in the state during the year under report and the industry in this ore is now at a standstill.

The Bombay Mining Syndicate, who held a mining lease and a prospecting license for mica in the Seringapatam Taluk met with no success during the year under report. A prospecting block in the Yedatore Taluk gave some promise. Several mica deposits to the east of Kikri in the

Sringeri jahgir were opened up and a quantity of 60,000 lbs. of muscovite mica of a fairly good quality was unearthed.

A small quantity of 38 maunds of asbestos was removed from a block in the Hosdurga Taluk for experimental purposes. Excepting this, no regular business was carried on in the industry of this mineral during the year under report.

During the year, certain localities in the taluks of Hosdurga and Holalkere where iron smelting and steel making industries were being carried out were inspected, and information in regard to the processes employed in connection with these industries collected.

The number of persons employed in the mining industry during the year 1910-11 was 27-116 as against 29,168 in 1909-10. Of these 26,339 were engaged in gold mines alone.

Essays on Indian Art, Industry & Education

BY E. B. HAYELL.

*Late Principal, Government School of Arts, Calcutta,
"Author of Indian Sculpture and Painting," etc.*

All these Essays deal with questions which continue to possess a living interest. The superstitions which they attempt to dispel still loom largely in popular imagination, and the reforms they advocate still remain to be carried out.

Contents:—The Taj and Its Designers, The Revival of Indian Handicraft, Art and Education in India, Art and University Reform in India, Indian Administration and 'Swadeshi' and the Uses of Art.

SELECT OPINIONS.

The Englishman, Calcutta.—Mr. Hayell's researches and conclusions are always eminently readable. *** His pen moves with his mind and his mind is devoted to the restoration of Indian Art to the position it formerly occupied in the life of the people, to its reclamation from the degradation into which Western ideals, falsely applied, have plunged it, and to its application as an inspiring force to all Indian progress and development. *** It is full of expressions of high practical utility, and entirely free from the jargon of the posturing art enthusiast.

The Modern Review.—We may at once express our emphatic conviction that it is a remarkable book, destined to leave its impress on the current thought of India, and to guide her efforts into new channels, to her great glory and honour. Crown 8vo., 200 pp.

Re. 1-4. To Subscribers of the "Indian Review," Re. 1.

The Paper Industry.

A recent American consular report quotes a letter from one who has had a good deal to do with the manufacture of paper in India. The contention that before success can be attained in India in increasing the output of paper we must have a wood pulp manufactory is, says a Rangoon Paper, not based on actual conditions. The material supply has nothing to do with the reasons why the working of Indian mills have not given satisfaction of late years. The trade is simply suffering from a lack of facilities for manufacturing with economy—that is *modern* machinery capable of large output, the same as is now employed in other parts of the world. Machinery designed and manufactured in the last century can hardly hope to compete with modern, up to date time and labour saving machinery in use in Europe and in the United States. Before any serious thought can be bestowed upon pulp mills, whether wood or bamboo, the demand for the material must be created. The existing Indian paper mills do not want wood pulp because they have ample supplies of grass fibres, a much superior material for paper making. The material is fairly cheap. Indian mills as now equipped could not use wood pulp profitably, even if it were available at a very low price, for the reason that their machinery is not adapted to the making of cheap mechanical wool pulp papers. The mills have a constant demand for a better class of paper than is made of wood pulp.

It must not be supposed that the Indian paper mills have to depend solely upon grass babul. There are a number of other excellent grasses and fibres growing in India. Many of them have been experimented with from time to time and shown to be useful papermaking material, and that these grasses have not been utilized more is owing mostly to the fact that the larger resources of babul grass render the adoption of any other grass fibre unnecessary. Some of the grasses referred

to would make valuable paper making material with a properly selected plant for the preparation and treatment of the fibres. These resources would need to be utilized before it would be necessary to give attention to wood pulp. Bamboo will take precedence of wood pulp in India. Experiments made with this fibre years ago were satisfactory but a special plant for the suitable treatment of the pulp would be needed. The Burmese Government offers to back a scheme for the use of bamboo in making pulp but the promoters must first find the means of utilizing the pulp which can only be done by promoting new paper mills devised for utilizing both bamboo and grass fibres. There can be no doubt of the success of other paper mills built on a modern plan and equipped with reference to the use of the abundant raw materials at hand. India is essentially a paper making country and could easily be independent of other parts of the world for paper supplies. In fact with the advantage of cheaper steamer freights for export which may come in time, India will be in a stronger position to supply the East with paper than any European paper making country.

Indo-Ceylon Connection.

Sir H. Kimber and Messrs. Neville Prestley and Muirhead, the Indian railway authorities, have been conferring with the Ceylon Government on the subject of the Indo-Ceylon connection. The results of the conference are most satisfactory to both Ceylon and to the South Indian Railway Company. Regarding the customs arrangements the Ceylon Government is willing that there should be a joint examination of luggage etc., on behalf of both countries, on the steamers which will carry the passengers and goods across from Talaimannar to Duniakhedi, where the railways of the respective countries will end. The passage will occupy one hour and ten minutes. The work is being pushed on both sides and March next year should see the inauguration of the Indo-Ceylon connection.

AGRICULTURAL SECTION.

The Uses of Eucalyptus.

These are mostly concerned with the medicinal properties that are possessed by the oil that can be extracted from the leaves; as an antiseptic, this is of peculiar use. Advantage may be taken of a useful summary, of the ways in which Eucalyptus may be employed, which is given in *L'Agriculture Pratique des Pays Chauds* for November 1911, in which it is pointed out that, to Baron F. von Muller, Director of the Botanical Garden of Melbourne, must be attributed not only the discovery of a large number of species, but the first experiments in the distillation of the leaves. Further, it is to Bosisto, a chemist of Melbourne, that the extension of the Eucalyptus oil industry must be credited, as well as the discovery of various uses to which it may be applied.

As far as is known, *Eucalyptus amygdalina* is the species that is richest in essential oils, though its rate of growth is far smaller than that of *E. globulus*. The researches of Bosisto have shown that the species from which the leaves have most commonly been submitted to distillation give returns of essential oil in the following order: *E. amygdalina*, *E. oleosa*, *E. leucoxylon*, *E. gonio-calyx*, *E. globulus* and *E. obliqua*. Of these, as regards *E. globulus*, the inferiority in the yield of oil is compensated for in its vigorous growth and its abundant foliage. In any case, it is a fact that the amount that can be obtained from each species depends upon the season and the locality.

It is a characteristic of *E. rostrata* that it flourishes in inundated lands and in those subjected to sudden and heavy rainfall. *E. oleosa*, on the other hand, is particularly fitted for cultivation in dry and desert regions.

The article quoted above which presents this information, goes on to say that the researches commenced by Baron von Muller, and continued

by Bosisto and Osborne, have shown that eucalyptus oil dissolves, among other substances used for making varnish and such preparations, camphor, pine resins, mastic, gum Elemi, sandarac, asphalt, Xanthorrhoea resin, dragon's blood, benzoin, copal, amber and wax, but not gutta-percha.

The ash obtained from different kinds of Eucalyptus yields 5 to 27 per cent of potash. A ton of the leaves of *E. globulus* will give over 10 lb. of pearl ash; while a similar quantity of the green wood furnishes more than 2 lbs. and the dry wood at least 6 lbs.

In pharmacy, the leaves of Eucalyptus and the oil are employed in many different ways: for pills, cachets, fumigants, washes, injections, sweets, pastilles, infusions, cigarettes for asthma, oils, aromatic vinegars, salts, soap, dental powders and pastes, insecticides, remedies for diseases of silk worms and bees, protection from mildew, fever remedies, colds, bronchial affections and those of the throat and lungs, neuralgia, depression, cholera, vesical catarrh, uræmia, chronic rheumatism, gout, congestion of the brain and of the lungs, for protection against mosquitoes, and even for the purpose of reducing adipose tissue. Lastly, the oil is largely made use of in perfumery. The matter does not conclude here, for as it is pleasingly expressed by Morel, even after filling the place of a remedy for the greater number of ills, the products of Eucalyptus may be employed for embalming the bodies of those who have died because they were ignorant of its benefits.

After mentioning other similar uses of the oil and resin of Eucalyptus, the article goes on to state that, although too much may have been claimed for such products, scientific research has shown that they possess a real value, and that, particularly, the leaves of *E. globulus*—especially those from young trees—are endowed with antiseptic properties that are capable of utilization in many different ways.—*Extract.*

Protection of Indian Cattle.

At a recent meeting of the committee of the British Association for the Protection of Indian Cattle, which was lately formed in London, the following aims and objects were framed: (1) To prevent the unnecessary slaughter of cattle in India with the view of increasing the number and improving the breed of the animals employed for the cultivation of the land. (2) By this means to encourage the agricultural development of the country and so render the United Kingdom less dependent upon foreign countries for her raw material; (3) To improve the general condition and promote the more humane treatment of cattle in India.

The following is the copy of a letter addressed by Mr. K. S. Jassawalla to the Secretary of Home Department:—

The Assistant Secretary to the Governor-General of India writes me to say that "I am directed to acknowledge the receipt of the Petition submitted by you and others dated 17th November 1911 and to inform you that it has been transferred to the Home Department for official consideration and disposal."

In connection with the said Petition I beg to state that if your Lordship thinks that India is not short of agricultural cattle, I would suggest that a Commission may be appointed to investigate the matter, I will undertake to adduce evidence before the Commission and satisfy them as to how essential it is for India to maintain a large number of animals for agricultural purposes.

Your Lordship will observe that in the petition it has been suggested that the British Troops in India should be given Australian meat in preference to Indian beef.

With a view to assure the Government of India that this suggestion is quite feasible and practicable, and also with the object of facilitating the task before the Government, I have arranged to form a joint stock company for the purpose of

importing Australian meat into India. To ensure the scheme becoming a perfect success, however, the co-operation of the Government is desired and essential.

After twenty-five years of constant study and hard work in connection with this subject, I have thought it necessary to come forward and humbly offer my services and am quite prepared to supply the Government with meat (mutton, which is more suitable to the hot Indian climate than beef) at a price to be fixed on the average of the last five years' prices provided the period of contract is at least ten years, as much capital would be bound up for installing refrigerating depots. This will not put the Government to any extra expenditure and I undertake to bear all loss if there should be any. To convince the Government of the feasibility of the project, I will first begin the work in Bombay, and if the Government is satisfied, other depots would be opened up in Calcutta, Karachi, Madras and other ports and arrangements will be made to take the same to the interior parts of the country.

I am also prepared to make any reasonable deposit your Lordship may require for the satisfaction of the Government to assure them of my *bona fides*.

The great need of the factories in Great Britain is a sufficient quantity of raw produce. This could be easily met by India if her agriculture were allowed to develop in the right way with the result of rendering England independent of America and other foreign countries. This is particularly the case with cotton which India is capable of producing in any quantity and of any requisite quality as is evidenced from Government Reports (Vide 'Report on progress of Agriculture in India for 1909-1910' by Mr. B. Coventry Officiating Inspector-General of Agriculture in India. Also "Note on Improved and Exotic Cottons in the Bombay Presidency" by Mr. G. Keatinge, Director of Agriculture).

Departmental Reviews and Notes.

LITERARY.

"MANORANJAN" DURBAR NUMBER.

The "Special Delhi Durbar Number" is a volume of 280 pages containing more than 150 nicely executed photozincographs and more than 50 contributions from the best and the most cultured of Marathi writers and poets of the day. The special articles, especially those contributed by eminent persons like Dr. Sir R. G. Bhandarkar, M.A., Ph. D., K.C.I.E., &c; Sir Narayan Chandavarkar, Kt; Shrimant Sir Gangadhar Row, K.C.I.E., Chief of Miraj, ought to attract attention. No efforts have been spared to make the special number as attractive, instructive and interesting as possible. The number is apparently intended not only to have a high value as a collection of portraits and illustrations but also to have a still higher value as a very important and a weighty contribution of permanent value and interest to the Marathi literature of the day.

THE TRUE TEMPER OF EMPIRE.

Sir Charles Bruce, whose wide and intimate knowledge of the Empire has been gained as Governor of various Colonies, has a book on "The True Temper of Empire" coming out with Messrs. Macmillan shortly. "I define the true temper of Empire," he writes, "as a temper which mingles wisely and in fit proportions the sovereignty of the central authority with the liberties of the constituent areas." After the first paper, which gives its title to the book, Sir Charles deals with—The Modern Conscience in Relation to the Treatment of Dependent Peoples and Communities; Crown and Congress in India; The Passing of the Crown. What the Coronation Means to the Colonies; What the Coronation Durbar Means to India; British Indians in the Transvaal; British Indians in the Dominions; and Ireland's Place in the British Empire.

AN ARCHEOLOGICAL DISCOVERY.

An interesting inscription containing the name of Chandra Sen, King of Bengal in the 12th century, A. D. is reported to have been discovered in a *masjid* in the Burdwan District. At the end of last month three members of the Bangiya Sahitya Parishad made an excursion into the interior of the Burdwan District, called Northern Radh in ancient times. There they discovered that on eight stone pillars of a *masjid* eight equal parts of a slab containing some inscription had been used as the heads of the pillars. The inscription is in Sanskrit, and contains the name of Chandra Sen, and it is believed that the original slab was divided into eight equal parts and used as the heads of pillars of the *masjid*. The inscription originally contained dates of genealogical tables, but the major part of it has been destroyed by the chisel work of Mahomedan masons.

PENSIONS FOR TITLE HOLDERS.

The following Foreign Department notification appears in the *Gazette of India* :—

With reference to the announcement made at the Coronation Durbar by His Excellency the Governor-General, which was published in the Notification dated the 12th December, 1911, by the Government of India in the Foreign Department, it is hereby notified for general information that an annual pension of Rs. 100 payable on the 12th December each year, with effect from the 12th December, 1911, shall be granted to all present holders and future recipients of the title of Mahamahopadhyaya and Shams-ul-Ulma.

SISTER NIVEDITA'S WORKS.

The 'Udbodhan' Office intends publishing in a series of volumes all the writings of Sister Nivedita which she has left for the furtherance of the cause of education of Indian women. The first of the series, entitled, 'The Civic and National Ideals' is now out and can be had from the 'Udbodhan' Office, Baghbazar, Calcutta. It will be followed by others, and the publishers announce that the second will be more or less connected with education.

EDUCATIONAL

EUROPEAN SCHOOLS IN INDIA.

A SCHOOL OF ORIENTAL LANGUAGES.

The Board of the London Institution has issued a circular to the proprietors submitting a scheme which will obtain the imperial Government's approval for the adaptation of the institution as a School of Oriental Languages.

The Imperial Government undertakes to grant from £20,000 to £30,000 for rebuilding and an annual endowment of £4,000 with which to cover domestic expenditure. When the sanction of the proprietors is obtained a bill will be introduced in Parliament to legalize the project.

AN INDIAN POET'S SCHOOL.

At Bolpur, in Eastern Bengal, there is a remarkable school for Hindu youths which owes its origin to the greatest living representative of Indian letters—Mr. Rabindra Nath Tagore, poet and dramatist, essayist and writer of romances. The school provides an education of the kind which might be expected from a poet inspired by social ideals. Its students get plenty of outdoor teaching and physical training, while Western knowledge is related to the young Indian's heritage of historical and religious traditions. Recently, it would appear, something in connection with the school has aroused the suspicions of the provincial Director of Public Instruction, for he has issued a circular denouncing it as "altogether unsuitable for the education of the sons of Government servants." The incident has given rise to much discussion in Bengal, where the name of Tagore is held in the highest reverence. It is assumed that the school cannot have been condemned on political grounds, since teachers and students alike are required to hold aloof from all political activity.—"Westminster Gazette."

Influential meetings in support of this Fund, continue to be held in various parts of England. Speaking at Worcester, Bishop Mylne, who has long experiences in India said that the Anglo-Indian has grave professional disadvantages. Cut off from manual labour every service into which he might go was regarded as the happy hunting ground of the Brahmin. Take him altogether, there is no man in the world who needed more to have every advantage given him for a fair start in life. "My single quarrel with the Government of India," the Bishop added, "is that it never gives the Anglo-Indian a chance. Millions of money are spent year by year on the education of the Indians, but it is difficult to extract a few thousands for Europeans and Anglo Indians." The Fund now stands at over £96,000.

VERNACULAR EDUCATION IN INDIA.

We understand that the Government of India have addressed Provincial Governments as regards the Improvement of Vernacular Secondary Education and the starting of Vernacular Secondary Schools. The measure was urged on the attention of the Government of India at the last Budget Meeting of the Imperial Council by the Hon'ble Mr. N. Subba Rao Pantulu. He pointed out that the Court of Directors in their Educational Despatch of 1854 as well as the Government of India during Lord Curzon's time had laid down the principle of the diffusion of European knowledge among the masses by means of Indian vernaculars. No steps, however, had so far been taken to place higher Vernacular education on a solid and enlightened basis. Mr. Subba Rao pleaded that this should be given a proper place in the scheme of education in the country, 'correlated on the one hand to indigenous institutions and on the other to English Colleges; for after all it is the basis of all industrial or commercial occupations.'

LEGAL.

LAW TOUTS.

Mr. Swinhee, Chief Presidency Magistrate, Calcutta, recently disposed of a case in which the accused was charged by some members of the Bar for being a tout. The Magistrate in finding the accused guilty said:—"I am satisfied on the evidence before me that the defendant habitually acts as a tout. I therefore direct that a list of touts be framed and published and that the defendant's name be included in that list; and I further direct that the defendant be excluded from the precincts of the Police Courts."

COUNSEL'S DELAYS.

At the Central Criminal Court on the 16th January last, there was some delay in the Common Serjeant's Court owing to the absence of Counsel for the defence in two cases. The Common Serjeant said Counsels were neglecting their plain duty in not being present when their cases were to be tried, or, if they were unable to appear themselves, asking some other barrister to look after the interests of their clients. One of the Counsels eventually came into Court and explained that, as his case was some distance down on the list, he thought he would be safe to be away until 12 o'clock. The Common Serjeant:—"That is precisely what a Counsel should not do. They say, 'I think, I think, I think,' and they take their chance whether they will be wanted at a certain time or not. It is becoming a perfect scandal."

JURISDICTION OF CALCUTTA HIGH COURT.

In connection with the creation of the new Presidency of Bengal, a correspondent raises the point as to the future status of the Calcutta High Court, suggesting that logically it ought to take rank from the status of its Presidency; but this is not the case says the *Pioneer*. The Court is "the High Court of Judicature at Fort William in Bengal" and has jurisdiction over territories not administered by the Bengal Government. For

example, at the present time, its jurisdiction extends to Eastern Bengal and Assam. When the Presidency of Bengal is established this jurisdiction will continue, under changed conditions, and the Court will consequently not be under the administrative control of the Governor-in-Council, unless otherwise provided. The new Province of Behar and Orissa is to have its own High Court, we understand; and though no definite announcement has yet been made, it cannot be long before any doubt that may exist on the subject is removed. But Assam, as a Chief Commissionership directly under the Government of India, will be outside the Presidency limits, though under the jurisdiction of the High Court at Fort William. The latter, therefore, will still not be a purely local Court, though the number of its Judges will be materially reduced in order to staff the new High Court at Bankipur-Patna.

LEGAL PRACTITIONERS IN THE PUNJAB.

The following is the text of the letter addressed by Rai Sahib P. N. Dutt, Officiating Registrar, Punjab University, to the Principal, Law College, Lahore. The letter is dated the 3rd January 1911:—

"I have the honor to inform you that the Hon'ble Judges of the Chief Court have decided that in future admission of graduates to be Pleaders of second grade shall be regulated according to the numerical requirements of the Province. Number to be admitted each year will be announced three years ahead. For the year 1914 only thirty men who pass highest in the Bachelor of Laws Examination will be admitted to Pleadership. I am to request that this announcement of the Judges of the Chief Court may be duly brought to the notice of the students of your College."

Another Circular, addressed to the Principal, the Law College, says that the Judges of the Chief Court have decided that they will admit no person as Mukhtar after the 1st December, 1913.

MEDICAL.

NEW TREATMENT OF CHOLERA.

The new treatment of cholera by means of injections of hyponic salines plus permanganates is being extraordinarily successful. The credit for this, as was shown in a recent article on the subject in the *Pioneer*, belongs entirely to Major Leonard Roger, Professor of Pathology at the Calcutta Medical College. In his recent presidential address at the Asiatic Society of Bengal, Colonel Harris, I. M. S., quoted some returns which will interest the medical profession, not only in India, but all over the world. He stated that from 1895 to 1905 the death-rate from cholera at the Medical College Hospital was approximately 60 per cent. With the normal saline treatment in 1906 it fell to 52 per cent. On reverting to sub-cutaneous and other injections in 1907 it rose to the high level of 1895—1905. Then hyponic salines injected into the veins were tried and the death-rate in 1908-9 fell to 32 per cent. Since then Major Rogers has added permanganates to the treatment and the mortality has been only 23.3 per cent. As Colonel Harris puts the case:—"Whereas fifteen years ago, on an average out of 100 attacks forty people had a chance of recovering, to-day—if taken in time—seventy out of the same number will probably recover. Cholera should now lose some of its terrors in India, even when the worst epidemics are abroad."

CAMPAIGN AGAINST TUBERCULOSIS.

The following is the text of the letter in which Mr. Ratan Tata makes his munificent offer for contributing with funds for a campaign against tuberculosis:—"The Coronation Durbar was the greatest event in India of our time. Its beneficial results demand a commemoration. Very many are casting about for some appropriate memorial. May I suggest that such a scheme

might well deal with the great national malady. Such a malady is tuberculosis. It is rife amongst all classes of the population and especially affects "purdah" women. It is preventible and, in a large number of cases, curable. The campaign against tuberculosis lay very near to the heart of His Majesty's honoured father, and the sustained effort, launched now, would stamp out this distressing disease from amongst King George's Indian subjects. To be effective, the campaign must be thorough, but that is no reason why we should not make a beginning on scientific lines now. It is a work in which the Government, the Municipalities and the Industries should share in equal proportions, the Coronation subscriptions supplementing these resources. Factory hands are peculiarly susceptible to phthisis and mill-owners might well be asked to contribute at least a rupee a year for every operative. This would provide a lakh a year; and with the Government and Municipal assistance we should have a fund of three lakhs a year to finance the campaign. I shall be glad to contribute fifteen thousand rupees a year for ten years as my subscription towards this particular form of commemorating the King's visit and as testifying to my sense of urgency of organised campaign against phthisis."

MEDICAL-WOMEN IN INDIA.

The *Times*, in an article "On Medical Women in India," referred to the terrible extent of the evils incidental to the abandonment of Indian women in times of sickness to the ministrations of the most ignorant of their own sex, to the absence of any adequate provisions for medical attendances upon women, adding that many thousands of Indian women die prematurely every year from childbirth, and the only serious attempts hitherto made to afford female medical help to the women of India have been due to one of three agencies—the missionaries, Lady Dufferin's fund, and a few hospitals started by local philanthropy, and these taken collectively, are insignificant in comparison with the magnitude of the requirements.

SCIENCE.

PROPOSED INDIAN ASSOCIATION.

Mr. P. S. MacMahon, M. SC., (MAG.), B. SC. (Oxon), Professor of Chemistry, Canning College, Lucknow, and Mr. J. S. Simonson, D. SC., Professor of Chemistry, Presidency College, Madras, have issued the following circular letter:—

The rapid expansion, during recent years, of the teaching of science throughout India, as well as the multiplication of laboratories in Colleges and institutions designed for research purposes, has disclosed a lack of scientific organisation which calls for the attention of all those engaged upon education and research work in the country. The isolated worker in India is, for the most part, deprived of the help afforded by scientific reference libraries, and his difficulties are enhanced by the fact that he is removed from the European environment whence he draws in a large measure his inspiration.

We feel that the disabilities under which science suffers in India would be in part ameliorated, and that an impetus would be given to research work by the establishment of some central organisation after the manner of the British Association for the Advancement of Science, whereby different workers throughout the country might be brought into touch with one another more closely. The attention of the Society might be diverted to every field of enquiry and to every aspect of scientific activity, whether purely theoretical or applied to those numerous special problems offered by the Indian Empire and peculiar to its natural and economic conditions. The study of endemic diseases, of the conditions governing agriculture and forestry, of engineering problems in the tropics and sub-tropics of the natural products of plants and of the mineral resources of the country, all these subjects call for

extensive and systematic research in the laboratories with which India is now equipped. Behind this there is the larger educational problem, that of presenting to the minds of the people the aims of science, its purpose and ideals, its value as an instrument of social and economic improvement. The objects of the proposed Society are similar to those of the British Association, and they cannot be stated better than in the words which form the preamble to the constitution of that body:—"to give a stronger impulse and a more systematic direction to scientific enquiry; to promote the intercourse of societies and individuals interested in science in different parts of the country; to obtain a more general attention to the objects of pure and applied science and the removal of any disadvantages of a public kind which may impede its progress."

It is to be noticed that co-operation with the activities of the Society would not preclude the publication of results in European periodicals, nor in departmental journals dealing with particular branches of research; its primary aim is to afford a medium of communication between workers in different parts of India. Accordingly, it is proposed to establish an Association which shall hold an Annual Meeting (sectional or otherwise), in the more populous Indian towns where papers might be read and discussed, the proceedings to be published in the form of an Annual Report. We invite your opinion as to the expedience of founding a Society of this kind, and would be glad to know whether, in the event of its successful inauguration, you would be glad to support it on the general lines indicated above. The success of the scheme naturally depends upon the extent and representativeness of the support accorded to it. We hope to arrange an early meeting in Calcutta where the details might take practical shape.

PERSONAL.

NAGAR BRAHMAN OF GUJERAT.

In the course of an article in the current number of the *Dawn Magazine* on Marco Polo's account of the Indian Kingdoms and Ports, Mr. Haran Chandra Chakladar, M. A., writes:—

Marco Polo speaks very highly of a class of Brahman merchants living in the province of *Lar* which is identified with *Lar-desa*, an early name for the territory of Guzerat and the northern Konkan. He says: "You must know that these *Abramman* (Polo's corruption for *Brahman*) are the best merchants in the world, and the most truthful, for they would not tell a lie for anything on earth. If a foreign merchant who does not know the ways of the country applies to them and entrusts his goods to them, they will take charge of these and sell them in the most legal manner, seeking zealously the profit of the foreigner and asking no commission except what he pleases to bestow. They eat no flesh, and drink no wine, and live a life of great chastity. Nor would they on any account take what belongs to another; so their law commands. And they are all distinguished by wearing a thread of cotton over one shoulder and tied under the other arm, so that it crosses the breast and the back."

A WARNING TO EMIGRANTS.

At the instance of the Ceylon Government a warning has been issued to intending emigrants against their going to Ceylon without either considerable capital or assured employment. It has recently become necessary for the Government of the Colony to repatriate individuals who had gone to the island with insufficient capital and who, failing to obtain employment, were reduced to a state of destitution. It is useless for any one to go to Ceylon in the hope of obtaining employment on the spot.

INDIANS AND ORIGINAL RESEARCH IN CHEMISTRY.

The announcement by Dr. P. C. Ray at a recent meeting of the Calcutta Chemical Club that no less than fifty new compounds have been discovered within the past year will greatly interest the public. Dr. Ray in his address gave an account of the new members of the Alkylammonium Nitrate series, which have been isolated in the course of the last year bringing the total list up to 25. Mr. Hemendra Kumar Sen who passed M. A., in the first class, within a few days after the result was out, submitted as many as 9 papers based upon original investigations for the Prem Chand Roy Chand Scholarship Examination. Mr. Rasiklal Dutt, who is an M. Sc. student, has recently isolated no less than 15 compounds of Platinum and the Alkali metals and has hit upon a remarkable case of isomerism in the piece of research by him which will appear in this month's Chemical Society's journal. Mr. Kshiti Bhushan Bhaduri, M. Sc., Research scholar, has isolated 2 or 3 glucosides of Indian drugs and is also working hard in the direction of identifying the alkaloïds of these plants. The new University Regulations have imparted a stimulus to original research. We are glad to notice that on the occasion of the last annual meeting of the Indian Guild of Science and Technology, Sir Edward Thorpe, an eminent leader of science and a past-president of the *Chemical Society*—in the course of his speech referred to his Indian collaborators in the following terms:—"Speaking as a fairly old member of the Chemical Society of London, the oldest chemical society in the world, he welcomed with pleasure the recent increase in the number of Indian members. There was now a considerable body, who were active members and whose publications from time to time adorned their transactions. He hoped to see the day when some of them would begin to be active in the actual management of the society. Their assistance on the council would be welcomed, and he hoped perhaps to have the pleasure of seeing one of their members as actual President."—*Indian Messenger*.

POLITICAL.

THE CEYLON EXECUTIVE COUNCIL.

We have grown so accustomed already to periodic appointments of Indian gentlemen to Executive Councils that the public would be inclined to feel that it had just cause for complaint if Government did not continue every now and then to afford its subjects the pleasing spectacle of a zealous search for persons in this country willing to lend a hand in the tiresome business of keeping the Government machinery going. In Ceylon they have just started a similar experiment—only in this case the individual selected for an Executive Councillorship is not a non-official but a Ceylonese belonging to the Civil Service. Apparently this is the first time in the history of British administration in Ceylon that a native of the island has, to quote the *Ceylon Observer*, "outside the office of Attorney-General been able to occupy a permanent seat in the Executive Council." The Hon. Mr. Arunachalam, the gentleman in question, entered the Civil Service 37 years ago, the greater part of his official career being spent in the judicial line. In later years he has held the appointments of Registrar-General of Lands and Superintendent of the Decennial Census and has served on numerous Commissions dealing with subjects such as higher education, tuberculosis and the registration of titles. He is also the author of several publications treating of Ceylonese history and antiquities and Indian religions and philosophies and latterly has been engaged on a codification of the Civil Law of the island. He belongs to an ancient Hindu family which has rendered distinguished public service and has been seldom without a representative in the Ceylon Legislative Council since its establishment in 1833. He was one of the earliest band of native students at Cambridge and a fellow student at Christ's (though junior in years) of the late Justice Syed Mahmood of the

Allahabad High Court and of the late Mr. Ananda Mohan Bose of Bengal and was like Mr. Bose a foundation scholar of the College. His uncle the late Sir Coomaraswamy, who was knighted on Disraeli's recommendation, was a friend of Lord Houghton and his son the Marquess of Crewe and an honoured guest at Fryston, as Sir T. Wemyss Reid mentions in the *Life of Lord Houghton* and was so highly thought of by Disraeli that he put him into his last novel as a type of the happy blending of Eastern and Western culture. Mr. Arunachalam's cousin, Dr. Ananda Coomaraswamy, is well known in India as an apostle of Indian ideals in Art.—*Pioneer*.

HIGHER POLICE APPOINTMENTS.

Sir Reginald Craddock, replying to Mr. Madge's question re higher police appointments, said: "I place on the table a statement, the figures in the several columns of which answer the three parts of the Hon. Member's question. The Government of India have no information as to how many of the 26 officers shown in column 2 of the statement were domiciled in the strict sense of the term. In answering the question, the phrase "Members of the Domiciled Anglo-Indian Community" has therefore been interpreted to mean officers recruited in India, as distinguished from officers recruited from England; and I gather from parts (2) and (3) of the Hon. Member's question that this interpretation gives him the information which he requires. The statement does not include a few military officers who have in special circumstances been appointed in India to the Civil Police in Burma, Bengal and Eastern Bengal and Assam.

THE NEW CAPITAL.

In compliance with the request of Mr. Montagu, Under-Secretary for India, the Liverpool Health Committee has decided to recommend the City Council to lend to the Government of India the services of the City Engineer, Mr. Brodie, for the purpose of assisting in laying out of the new capital at Delhi. A special meeting of the council has been called for to consider the matter.

THE BED OF AN INDIAN RIVER.

BY FLORA ANNIE STEEL.

TO English experience, the bed of a river suggests rocks or stones, gravel or mud. The English eye imagines it between definite banks, either full of water or lying empty, waste, almost desolate with shingle stretches and sandy breaks. There is an air of expectation over all; the very roundness of the boulders suggests the water for which they are waiting.

It is not so in India. There, especially in the north, the rivers flow between banks it is true, but these banks are often as much as nine miles apart: the one therefore quite invisible to the other, and you may ride miles in the river bed without even seeing the river itself. Indeed, the high bank often comes as a distinct shock when as you gallop your horse over the young green wheat fields, you pull up short on the brink of a mud cliff some twenty feet high. At its foot, the wheat fields go on. It is just as if the earth had at that moment sunk those twenty feet. The alluvial scarp looks fresh and sharp and clean: you have to ride along it until at a slight break in its regularity, a steep mud path leads down to the fields below. Here, close to the high bank there may be positively no difference either of soil or vegetation; for the river may for long years have trended away to the opposite side of its wide bed. Nevertheless, once upon a time, the river must have flowed right under that mud cliff. How many years ago no one can say. At

any rate it was from such a high bank on the Jhelum river that Alexander the Great said his farewell to the Land of his Desires, his Regrets. It is fitting before we pass on to the curious No Man's Land of an Indian River bed, that we should remember this great Retreat which, even when told barely by Arrian in the *Anabasis*, seems to stir the soul as Alexander's must have been stirred, with vague wonders as to what would have happened had the Western Conqueror remained instead of retiring.

There is something intensely pathetic in the thought of that flaming sword turned back, in the failure of the great Soldier's final appeal to his army, "Oh, Macedonian and Grecian Allies, stand firm! Glorious are the deeds of those who live a life of valour, and die, leaving behind them immortal glory." It reminds one of John Nicholson with that futile cry to his fellow-men, in the lane at the Burne bastion, "Come on, men, come on. Come on, you cowards."

As one stands beneath the mud cliff in this, the bright dawn of an October morning, one can imagine the endless train of galleys crowding the rapid yellow stream, all waiting for the signal to start from their leader. One can imagine him coming down the paved pathway which led from the clustering town above, one can see the quick organizing eye, that even in its disapproval had to see that all, as Arrian says, "was without confusion, without disorder." So we see him step into his barge, stand at its prow, pour a libation from the golden goblet into the stream, in the

name of the great Indian Rivers whom he had brushed and who had served him well—the Indus, the Jhelum, the Chenab, the Beas. Then with a blaze of golden trumpets the procession started, slow, stately, orderly, the "*noise of the rowing, mingling with the cries of the captains and boat swains, the choric songs of farewell from the natives who ran along the banks*" rising to "a veritable battle cry."

It must have been a fine sight, this passing of the Fighting West to return after many centuries, not with a Sword but a Pedlar's Pack!

So we gallop on into the "bait" land as the natives call it; a land full of its own quaint legends governed by its own quaint laws.

Here no man can say with certainty "this is my land." He may own it one year, the next it may lie in the deep stream, the year after it may re-appear in the other side of that deep stream: so by the law which obtains in many of these river beds, belong to another man, another village, nay, even another district. Bureaucracy and babudom between them (resolved to their constituents these two are curiously alike) have attempted to generalise and classify the quaint systems of "bait" land tenure into one broad red tape ribbon, binding on all; but not so long ago one of the most amusing day's work of a district officer's year was sitting in a boat watching earthen pots thrown overboard in order to decide which of the many streams was really the "deep one;" that being the one to which most pots drifted.

A blue sky overhead, the boat slipping down on the yellow flood, half a dozen or more of bottle-nosed alligators lying like logs on the sand banks, the wild geese rising lazily in flocks from the tamarisk thickets, a band of grey crane, their heads high out of the green corn giving their wailing cry, or a crowd of flamingoes looking like a sunset cloud, as startled from afar, they winged away into the horizon.

Then the big flat bottomed boat itself, laden with the elders of the various villages which had a voice in the decision. The anxiety on every broad bearded face; the relief on some, as one more pot after hesitating in a backwater bore steadily to the east, the disgust on others as a "*chatts*" which had been put down as eastward, suddenly changed its mind and bore away to the west.

Then, in addition to the question of proprietorship, there was the question of revenue to be paid to the Government, so that the work of what is called "Alluvion and Diluvian" used to necessitate two or three weeks camping in the bait land. Starting at dawn, sometimes on horseback, sometimes in a boat, sometimes on foot, most often for a compound of all three, one would be led by these same village elders, the village accountant with his books and his chains, over sand banks and fields, round tamarisk islands and sun fissured mud flats to measure up what land had gone into the river, and what had come out of it. One curious fact remaining year after year that the stream always swallowed up far more than it gave back, and that without growing any bigger!

Happy, happy days were these. A paradise for the sportsman, a joy for the artist, an endless interest to the lover of legends, the loiterer in historical bye paths; for much of Indian history is associated with these riverbeds. Many and many a time in flood season, opposing armies have looked at each other across their inundated flats for months together. One recalls with a smile for the rashness, the reckless courage of the woman, the incident of the Empress Nurjihan and her infant grand-daughter at the fording of the Jhelam. How she, generalissimo of her army, insisted on attack. How her forces landed on the opposite side drenched, disordered, dispirited. How weighed down by wet clothes and accoutrements they had to retreat, and how Nurjihan's elephant, cut across the proboscis, its driver killed

dashed back into the river, sunk in deep water, plunged, swam, sunk again; so carried down stream finally found shore. And after all this Nurjihan was discovered busily employed in binding up a wound which the baby on her lap—it must have been put there surely, as a loyalist onflamme—had received in the scrimmage!

Yes! there are many memories in an Indian river bed. Here is Sobraon, the battlefield which won for us the loyalty of the Sikhs. Coming as it did after those three rapid and glorious successes at Moodkee, Ferozeshahr, and Aliwal, it left no time for hesitation. Here, to this fighting race, were foes worthy of their steel. Men, who like the 10th foot would reserve their fire coolly till they had charged within the enemies' entrenchments.

"You were *that* much better than we were," said an old Sikh showing the tip of his little finger to me on this same battle-field. That much only, but enough for victory, for loyalty to the true fighter.

Then there is the terrible memory of the river bed at Fatehpur with the rebel mutineers firing at helpless English women and children as they drifted past in boats on the slow yellow flood of the stream. That is tragedy indeed, but the comic relief comes at the thought of the Emperor Huiyuan, half sodden with opium flying from his enemies and finding safety from drowning by the waterman's turban, flung to him like a rope from the high bank. Thereinafter promising the turban-owner any boon he desired, being met by a demand to be placed on the throne for twenty-four hours!

Then the "bait" land has its present legends, as well as its past ones. It is the home of the cattle raider and its impenetrable belts of high reeds, its impassable quagmires give the skilful cattle thief ample scope for dexterity. Endless are the tales of cunning or prowess which pass openly from mouth to mouth. How Gooloo the headman shod all his drove of stolen cattle so as to make the trackers believe that they were going eastward instead of westward and wore his

own shoes back to front for the same purpose; and how no less a personage than Shurfoo the *zaildar* in his salad days, once swam the Chenab itself in full flood, with a buffalo calf tied to him, so as to induce the mother to follow him and after her the whole herd; thus escaping the police that were on his track. These and many other tales are told round the shifting house fires; for the dwellers in the "bait" land have their habitations founded on the sand only—any day or night they may have to flit. The river may be invisible, green fields and tamarisk breaks may surround them, and yet in a few hours a ten foot flood may swallow up the homesteads.

One hot night in August, a twenty feet torrent swept down the old bed of the Sutly and by morning fifteen hundred out of the three thousand houses in the old Pathan city of Kasur were mere heaps of small, old purple bricks; for it was no temporary tower but built of old, three-storied, close-serried, strong.

But now-a-days there is one thing permanent in this shifting land which brings fatness and delight to so many folk; and those are the huge bridges with which England has spanned deep streams and shallow streams alike. Viewed from afar they show like some huge centipede stretching in some cases for miles. When they were first put there, dire were the tales round the village hearths as to what might be expected from such wanton interference with the rights of Mai Ganga the river goddess. She would surely rise in her wrath as she had done many times in minor fashion when puny man had ventured to span her tributaries with boat bridges.

And this time punishment would fit the crime. So said many a bearded husbandman, many a robust village mother; but the months, the years, have come and gone and the only stable thing in the Bed of an Indian River is that burden of girders and bolts and rivets and cantilevers which the British Raj set there, a symbol of its own purposeful grip on India; a grip that must not be relaxed until that purpose is accomplished.

WHEN ASIA RULED THE WAVES?

BY MR V. B. MENTA.

AT the beginning of the Russo Japanese War, many Europeans were surprised that an Oriental power should defeat a Western Power on land! But there were a great many more of them who having never dreamt for a moment that Asia had ever done anything on sea, were electrified when they read of the continuous and imperishable victories of Togo in naval engagements. For those to whom the victories of Togo came as a surprise I write a short account of the sea power of Asia from the beginning of history till the present day.

It is to be regretted that no one has given a proper account of the naval history of the East. It is a well-known fact that many Oriental countries in Ancient as well as in Mediæval times possessed a large merchant marine. The Egyptians built several ships under their famous Queen Hatshepsut for the purpose of having a large foreign commerce. Oars and sails were used for propelling them. They traded with Arabia for resin, spices and gold, and one can see on the walls of a temple, built during that Queen's reign, this fleet represented in a fairly clear manner. We also know that their great King Thothmes III, had a fleet launched on Euphrates in order to defeat the Assyrians. He also successfully attacked Syria and Phœnicia from the sea, reduced Cyprus and ravaged the coast of Cilicia. It is also said that he captured Orete, the islands of the Ægean, some of the sea-ports of Greece, Asia Minor, Southern Italy and of Algeria. All these facts may be read in the great song of Ammon. Later on, two fleets were built by the Phœnicians for Egypt, one of which circumnavigated Africa. It rounded the Cape of Storms (long before Vasco de Gama) and returned, by way of the Atlantic, the Straits of Gibraltar and the Mediterranean Sea, to Egypt.

There is not enough known of countries like China, India, Japan, Assyria and Persia from a naval point. Sennacherib employed Phœnicians like many other Sovereigns to take his Assyrian army across the Gulf into Elam which he conquered. There is no doubt, that ancient Indians used ships for commercial purposes and in the eighteenth and nineteenth centuries we do read a great deal about powerful and independent private chiefs ravaging the West Coast of India. The Persians like the Assyrians and the Egyptians made use of the Phœnicians. On the day when the pass of Thermopylæ was defended by the Greeks against the Persians, two naval battles were fought between the same races, in the second of which the Greeks were utterly defeated at Artemisium. The Phœnicians were also employed as engineers by Xerxes when he was marching against Greece. They cut a ship canal through the isthmus which joined Mount Athos to the mainland at that time, and constructed a double bridge of boats across the Hellespont which should form the basis of a solid causeway.

The Chinese have been a sea faring people from the very commencement of their history. Being a peacefully commercial race, their navy was never very powerful for offensive purposes. But though useless in naval warfare, their sailors discovered America long before the days of the Spaniards. The Japanese on the other hand, were intrepid sailors, rejoicing in war. When the great Kublai Khan sent 100,000 soldiers in 300 vessels to take Japan, the Japanese tell us that they killed almost all the Chinese and Korean soldiers sent against them, destroying at the same time the whole Chinese navy. In 1552 A.C., some Japanese pirates, who were for a long time ravaging the coasts of China, landed on the continent, took up a fortified post and finally laid siege to Nankin. On land, they were then unsuccessful but they have always defeated their neighbours in naval engagements from early times down to our own days.

The Phœnicians were a wonderful sea-faring race. It is difficult to find even now many commercial races equalling them in the boldness of their enterprises. They traded with parts of the world which were then unknown to the Western Asiatic and the Southern European races. They were honest and their wares were good. Tyre had become perhaps the richest city in the world at one time. Ezechiel thus spoke of her, "Thy builders have perfected thy beauty. Thou didst enrich the kings of the earth with thy merchandise and thy riches." They traded even with England for tin. They had colonies in Cilicia, Cyprus, Rhodes, the Greek islands, Malta, Sicily, Gades and Malacca, in Spain, in Sardinia, in the Balearic islands, in Corsica and Elba. On the northern coast of Africa they had Utica and Carthage. They had several colonies on the West coast of the same continent and in the Red Sea also. The great city of Tyre was destroyed by the arrogant Macedonian hero, and Rome with her temperamental dullness destroyed the very individuality of the race.

Carthage founded by the Phœnicians, may be called the first great Naval Power of the world. She also founded colonies in Africa, and traded with many races. The Carthaginians said that they too, had rounded the continent of Africa. But they were on the whole a warlike people. A Carthaginian called Malchus took the western part of Sicily, and even went to Sardinia. Then we come across a Hannibal, (the grandson of a Hamilcar, who was defeated at Himera in Sicily by the Greeks) who went over there to avenge his grand-father's defeat. He took Selinus. He won, with his 1,500 transports and sixty triremes (men of war) an over-whelming victory over the Greeks. Himera was then destroyed by him. The Syracusan fleet was annihilated very soon after, by Hamilco. Carthage then took possession of Agrigentum, Gela, Camarina. The battle that Mago fought with the Greeks on sea was an even

more wonderful feat than the other Carthaginian victories. Before the city of Catana, he defeated a Greek navy larger than his, intercepted the fugitives, who were swimming towards the shore in order to join the land-forces which were waiting there. The Carthaginians are said to have captured one hundred ships and killed twenty thousand Greeks on that memorable day. When Dionysius heard that the docks at Carthage were burnt, he sent a large navy against that great city. The Carthaginians on hearing of it, promptly sent out 200 ships to Sicily. The rival fleets met on their way and the Greeks returned home with the loss of half their squadron.

Then came forth Rome on the world's stage. The coasts of Italy were oft and again ravaged by the Carthaginians. The Romans after innumerable disasters learnt that their ships were worth nothing, and that they must learn ship-building by taking a Carthaginian vessel as their model. But Rome never became at any time, the equal of Carthage on sea. During the second struggle for the possession of Sicily, two Roman fleets were destroyed. Carthage at the height of her naval glory, (which inspired Turner in our days) forbade Rome to trade with Sardinia. She had a great deal of power over many Italian sea-ports also. Adherbal, the Carthaginian admiral, was surprised by a Roman fleet, but he fought so well that he destroyed the Roman navy, capturing 103 vessels. When another Roman fleet was annihilated shortly after that event, Rome found herself without a navy. It is also worth mentioning, that in the degenerate days of Carthage, Hamilcar, the great captain (the father of the immortal Hannibal) defied the Roman power in Sicily with his fleet for nearly five years.

The ordinary man knows that the Arabs were invincible warriors, who overthrew two mighty Empires and numberless kingdoms, but he does not know that they had conquered the sea also to a great extent. The English word "admiral"

and scattered their ships far and wide. Had Raphael known the truth he would not have painted the battle of Ostia in such pleasant colours, as he has done!

During the Middle Ages, some of the advanced sea-ports of Europe were treated on terms of equality by the African rulers. There were many treaties concluded between Pisa, Genoa and Venice and some of the Provençal sea-ports on the one hand and Tunis, Telimsan and Fez on the other. But during those times the chief pirates of the Mediterranean were Christians who, without any provocation, would sometimes attack the Moslems. When the Saracens found that the states to which these pirates belonged did nothing to prevent them from acting unlawfully they were finally forced to take the offensive. In 1002 A.C., the Saracens pillaged Pisa and three years later burnt a great part of the same town.

The Moors during seven centuries of a glorious rule in the Iberian peninsula had not neglected their navy as we have said before. They were wonderfully successful in commerce. Their ships could be found from China to Scandinavia where their coins can still be found. They had more than 200 vessels and fought successfully for the mastery of the seas with the Fatimites of Africa.

They used the magnetic needle for the first time in the European waters having learnt its use from the Chinese, that great race of inventors. It is said by some of the writers on the history of Islam that the Saracens had discovered America before the days of Columbus. Judging by the types of civilization which flourished in South America when the Spaniards landed there, we should not be at all surprised to learn that some of the Oriental races had gone there long before Europe had shaken off its barbarism. Finally, it should not be forgotten that these early Mohammedan navies taught commerce and the science of Geography to Europe.

When the Moors of Spain were mercilessly persecuted and driven out from their native land by their Christian enemies they took refuge on the northern coast of Africa. Once secure there, they commenced to harass the southern European countries and especially Spain. They attacked their beloved Andalusia again and again in their light brigantines and carried away many a dark-eyed beauty from there. The Spaniards might perhaps have finally succeeded in exterminating the Moorish rovers, had not an event of the very greatest importance to Europe happened at that time. The capital of the Eastern Roman Empire fell before the valour of the Ottomans, the last of the Islamic races who kept up the traditions of Moslem greatness in Europe. Sultan Mohmand II was the first Ottoman ruler to employ a navy, because he found that Constantinople was defended both from land and sea attacks. This indefatigable warrior had his highest vessels transported from the Bosphorus into the higher part of the Bay. Within one night only he had 88 galleys and brigantines of 50 and 30 oars landed on the shores of the Bosphorus. The Greek galleots were sunk and the great city fell before the besiegers. In 1479 the Ottomans took Negropont from Venice. All the Greek islands of the Aegean passed under their sway with the fall of the Greek (or Roman) Empire, and most of the Levantine islands acknowledged them as masters. The Genoese and the Venetians lost all power in the vicinity of the Ottoman Empire, for the Turkish castles commanded the Hellespont and the Bosphorus. The Genoese ports in the Crimea (which was now under the Osmanlis) and the Sea of Azov were no longer of any great value, because all communications between them and the Genoese ships were now severed. When Ahmed Gedik, the Grand Vizier, as well as the Admiral of Mohamed II took Otranto in 1480 A.C. the whole European world trembled for the safety of Rome which was however saved by the sudden death of the great Sultan.

Sultan Selim I. had collected a large army and navy, with a great scheme in his head, when he died leaving his son Soliman, with great resources, for future conquests both by land and sea. Soliman, knowing that Venice had been humbled by his predecessors at the battle of Zonchio, turned his attention towards the island of Rhodes, which possessed a powerful navy under the knights of St. John. In 1522 the great Turkish Caliph took it by using his army as well as his navy. The Eastern basin of the Mediterranean was now under the Ottomans.

On the Northern Coast of Africa, the Moorish pirates had been getting weaker and weaker as we have noticed above and would have been perhaps annihilated had not the Turks suddenly come to their help there. Uruj Reis a Turk, had the ambition and the ability to become a great pirate and a trouble to all the Southern European countries. He made Tunis his headquarters and then started on his adventurous career. Whilst waiting near Elba, he saw two galleys royal, laden with goods from Genoa for Pope Julius II. Though he had only a galleet and a few men with him he boldly attacked his opponents and took both the men and the treasures under his protection. Before his death this bold Captain had the joy of destroying a mighty Spanish fleet sent by Spain against the Turks and the Moors. Khayer-ed-din brother of the dead Captain, known to the world as, "Barbarossa" then took his place. Being more politic than his brother, he sent his homage to the Grand Signior at Constantinople Soliman accepted it, and made him the Beglerbeg of Algiers. He then defeated a great Spanish fleet under Don Hugo and sent one of his lieutenants to take Majorca. Portundo, the Spanish Admiral, was killed and the Turks took away many Spanish ships with them. When the great Soliman heard about the naval genius of Barbarossa, he requested the pirate to see him at Constantinople. The great Captain went there, was made

the Chief Admiral of the whole Turkish navy and was then asked to improve the Ottoman navy at once.

We need not describe all that Barbarossa and his successors did for a long time. Charles V, Venice and many other European naval powers were humiliated by them. They carried off rich booties and slaves from the southern European countries, Barbarossa siezed 18 galleys at Cetraro, took Tunis and laid waste the Apulian coast, swearing that he would soon nominate a Pope of his own choice at Rome. It is also interesting to remember that the great Ottoman Sultan had a Suez fleet which conquered Aden and was often seen in the Indian Ocean which made the Portuguese on the Western Coast of India tremble for their possessions in India. Finally the Pope, Spain and Venice united together in order to bring the naval supremacy of Turkey to an end. There were 200 ships of war, 2500 guns and 60000 men under Capello the great Andrea Doria and Grimani. Barbarossa with a far inferior force stationed himself near Prevesa a Turkish fortress. But Christendom dared not attack the Turkish navy. When they felt themselves powerless to do anything against the Turks they began to retreat in order. The great, the invincible Barbarossa gave them a hot pursuit, took seven of their galleys and sunk almost all the remaining ones. The Turkish fleet was now the mistress of the Mediterranean. Before Khayer-ed-din's death he was invited to Marseilles by Francis I. as an ally and on that occasion the banner of Our Lady was lowered and the crescent put up in its place. He then appeared off the mouth of the Tiber and terrified the inhabitants of Civita Vecchia.

When Charles V. heard that Barbarossa was dead he collected a great fleet with the object of destroying the pirates' nest at Algiers. But he met with an unforgettable reverse. He returned home almost broken down in spirits. Dragut (or Torgbud) now took the place of Barbarossa. He defeated a great European army and navy near

Tripoli which they wanted to take. 18000 Christians died in that memorable battle. He took even a part of Malta though fatally wounded there. Ochiali succeeded the brave Dragut. He took Cyprus but was defeated at Lepanto. We must not, however, think that the Turks could do nothing after that famous (among the Westerners) battle. Their fleet was repaired speedily which forced Venice to sue for peace. In 1574 Ochiali re-took Tunis which Don John had taken in 1653.

The great days of the Turkish navy were now over, but the petty pirate-chiefs of Algeria continued their trade boldly. They descended upon Madeira, Denmark and Iceland. In 1631 Murad Reis ravaged the English coasts and descended upon Baltimore. From the sixteenth to the eighteenth century, conscious of their power these Corsairs used to treat the consuls of different Western nations with great contempt. Till the nineteenth century the English, the French, the American and other Governments had to pay tributes to them, if they wanted their ships to pass through the African waters safely.

The Algerian pirates could no longer continue to practise their trade from the beginning of the nineteenth century. Europe then came to the conclusion that the Orientals had done nothing in naval matters. By the second-half of the century the whole method of naval warfare had undergone a change. The methods of fighting on sea which Carthage, the Arabs, Barbarossa and even Nelson had employed became obsolete. Battleships, torpedoes and other inventions of a scientific age displaced the age of hand to hand fighting. The end of the last century saw a small Asiatic island in the Far East destroy the old-fashioned navy of a great Oriental nation. The world began to see that Asia had commenced to move again. Before the new century had seen the close of her childhood, the world began to rub its eyes, wondering whether the reports it heard from the Far East were really true! At last,

bewildered and astonished, both Asia and Europe learnt that a great naval battle had been fought in the Straits of Tsushima between the Japanese and Russians and that the Russian fleet had suffered a crushing and unparalleled defeat. Admiral Togo, who destroyed two Russian fleets during the war, has already taken his place side by side with the greatest Eastern and Western naval heroes, with Barbarossa, with Dragut and with Nelson. Nobody can tell us with certainty, what this island Empire of the Far East will not be able to do on sea, before this century closes its life.

"HOW I FLY."

BY MR. CLAUDE GRAHAM-WHITE.

"**H**OW is it done?" This question is addressed to me so frequently after I have made a flight that I have decided, in the following article, to explain what makes an aeroplane fly, and also how it is that the aviator is able to control it when in the air. Although people have seen a good deal of flying already in this country, it has been surprising to me to note how little even now is known about the practical aspects of flight.

It is, fortunately, quite easy to describe flying without becoming technical. In the notes which I shall append herewith, my endeavour will be to explain what I do, and why I do it, in a way that any person not versed in aeronautics will be able readily to comprehend.

The machine I shall take for purposes of description is the Farman biplane, which I fly so often, and which is a standard type of air-craft. To begin, at the very beginning, we will first suppose that we are watching the aeroplane moving along the ground prior to a flight.

At the rear of its two main-planes is the engine. This, revolving at a thousand revolutions a min-

ute, carries round with it the propeller, and so forces the machine along the ground. The propeller of the aeroplane is constructed very carefully from layers of special wood. It has two blades. These, whirling round in the air, thrust the aeroplane forward in the same way as does the propeller of a ship.

The weight-carrying effect with such an aeroplane is obtained from the two big main planes. These, set one above the other, are kept apart by wooden supports, which are held rigidly in their place by tension wires. One of the first things that an observer notes regarding the lifting-planes of the machine is that they have a curve upon them. The front edge tilts down a little and towards the rear the planes curve down slightly also. Many people ask, "Why is this?"

The answer is simple. The plane copies in its curve the wing of a bird. It was Lillenthal, a German engineer, who was making experiments with gliding aeroplanes as long ago as 1890, who discovered that the bird-wing curve exercised a far greater "lift" when thrust through the air than did a flat plane surface. So, nowadays all the planes of aeroplanes are replicas of Nature's curve on the bird's wing.

There is no difficulty in explaining how the curve on a plane acts when the aeroplane is in flight. You must remember that the plane moves through the air, when the machine is in motion, at a speed of more than forty miles an hour. The air first strikes the dripping "nose", as it is called, of the plane. Some of it immediately rushes up under the curve on the lower side of the plane, and sweeps away in a curving stream towards the rear edge of the surface. The effect is that of gripping or holding the air during the period that it passes under the plane.

What happens may be better understood, perhaps, if I say that the air is thrust down by the curve of the plane. This action allows the plane to derive an appreciable "lift" out of the air

which it displaces. The air that passes over the top side of the plane is made to do useful work also. Its tendency is to move straight back from the front edge of the plane. It does not follow the downward curve towards the rear edge of the plane. Thus, as the air passes straight away, a partial vacuum is created along the dipping down edge of the plane, and this exercises a distinct upward pull. Therefore, the plane is pushed from below, and pulled from above. This dual effect makes the bird-wing curve infinitely more effective than a flat plane would be.

By the adoption of this curved plane the builders of aeroplanes know that, if they employ a machine with a certain number of square feet of surface, and thrust it through the air at a certain speed, they will be able to lift into the air a certain weight. I have now described how the two main supporting planes of a biplane do their work. But this is not all, of course.

The question of balance and control enters largely into the flying problem. Therefore, you find, set out upon wooden booms at the rear of the biplane, a tail composed of two small planes, placed one above the other. These two planes tend to balance the aeroplane when in flight in the same way as does the tail of a bird. Then one comes to the point as to how the aeroplane is to be made to rise or fall, turn from side to side, or balance itself when it shows a tendency to tip sideways in the air.

Midway between the two small tail-planes one finds a vertical plane which resembles the rudder of a ship. This plane, in fact, acts for the aeroplane in the same way as does the rudder of a vessel.

Now comes the question of making the aeroplane rise or fall. To do this one finds set out in front of the main planes, on wooden outriggers, a small horizontal plane, which can be moved up or down at the will of the pilot. Very often this front elevating plane is coupled up with a smaller

one, which is fixed at the rear of the tail-planes, so as to exercise a greater lifting influence upon the machine.

The only other controlling device is represented by the "ailerons". These are fixed at the rear edges of the main planes, and work up and down on hinges. Their object is to correct any loss of lateral stability upon the machine; or, to put it more simply, they counteract any sideways falling movement when in flight. How they act may thus be described: when the aeroplane is struck down by a gust of wind, and tilts over on one side, the pilot draws down the "ailerons" on the side of the machine which is depressed. The wind, acting upon the "ailerons", pushes the machine back again upon an even keel. Thus I have outlined the controlling mechanism of the biplane.

Now comes the question of flying such a machine. The pilot takes his seat on the front edge of the lower main-plane, exactly in its centre. To his left hand are the switches which control the engine. To his right hand is a lever. He places his feet against a rod, which moves to and fro upon a central hinge. Mechanics start the engine by swinging round the big propeller. Then, when the motor has started, he accelerates it by moving a switch until it is turning the propeller at its maximum speed.

Until he is quite ready to start, his mechanics hold back the aeroplane by gripping the tail-booms. After listening for a moment to the engine, and making certain that it is running well, the airman holds up his hand. This is a signal to the mechanics to release their hold on the machine. When they do this the aeroplane starts off across the ground, running upon the wheels which form part of its landing chassis.

The pilot allows it to gather speed for a few seconds; then he draws back towards him the lever which he is holding in his right hand. This has the effect of tilting upwards a little the

elevating plane which is set out in front of the machine. The effect of this is to raise upwards the whole machine. The rush of air under the main-planes intensifies their "lift", and the wheels of the machine leave the ground, and it begins to soar upwards. The pilot still holds the elevating plane at a slight upward angle, until the aeroplane has "climbed" sufficiently high. Then he brings it gently back to a level position again, and the machine flies straight ahead.

When gusts of wind assail the machine, and it tilts to one side or the other, he corrects this by sideways movements of the same lever which controls the elevating plane. This lever is coupled up to the "ailerons", and actuates them.

When the time comes to make a turn in the air, the pilot moves the rod, against which his feet are resting, and swings the rudder over either to the right or left. In this way the machine is flown. When a descent is necessary, the airman points his machine earthwards by tilting downwards the elevating plane. Then as the machine comes gliding towards the ground, he usually stops his engine, and makes what is known as a "glide plane." In this case the machine glides downwards with its own momentum. Just before he touches the earth the pilot draws back his elevating plane a little, and brings the aeroplane upon an even keel, so that its wheels touch quite lightly.

This description may, perhaps, make flying appear very easy. So it is, as a matter of fact, when the weather conditions are favourable. Many men learn to pilot an aeroplane after only two or three short lessons. In some cases, indeed it has been found easier to fly an aeroplane than to learn to drive a motor-car.

But a very great deal of skill is required to pilot a machine when the wind is gusty. Then the aero swings and rolls about in the air, sometimes in a very alarming way. Incessant watchfulness is necessary to keep it upon an even keel,

and none but experienced flyers care to ascend unless the weather conditions are good.

Another contingency which calls for skill is when the engine sometimes stops accidentally in the air.

Perhaps when his motor fails him, the pilot is flying swiftly across country.

In such a case, he has to descend in a "vol plane," and pick out a suitable landing spot as he comes gliding down to earth.

To keep one's head at such a moment, and make a safe descent, means the exercise of a great deal of skill—and this only comes by experience.

THE HON. MR. GOKHALE'S EDUCATION BILL.

THE rejection of Mr. Gokhale's Bill for introducing compulsion gradually into the

Elementary Education system of the country has caused great disappointment. The bill, modest and amply safeguarded, had received, as its sponsor claimed, unprecedented public support. Till the views of the provincial administrations were published, the non-official leaders' little boat sailed along bravely before the breeze of popular acclaim. Expectation had been raised to the highest pitch by the Durbar boon of 50 lacs a year for truly popular education. But from the beginning Mr. Gokhale was never sanguine of the success of his measure and it must be said that his diffidence was shared by others who knew how slow the progress of democracy has been even in the West. But this check can only be temporary; the spirit of the time is with the Bill. The conscience of the British people is awakened and what is more to the point, the Viceroy has been careful not to make a pronouncement against compulsory education, and it is not beyond the region of possibility that the first Member for Education, ambitious and enthusiastic like the

ablest of his service, would like to leave his name associated with a measure of reform which will be cherished by future generations with nearly the same feelings as the great proclamations of royalty in the land. His speech on the occasion, when the mover of the Bill sought to have it referred to the select committee, showed a fine zeal for the cause of popular education and admitted universal Elementary Education to be an active ideal in the mind of the Government of India, though not included in its immediate programme. His Secretary, Mr. Sharpe who contributed an able and interesting—if not a very valuable—bit to the discussion seemed like a man compelled by duty to stay an onrush which could not be prevented, but which he would be content for his part to have arrested for a little day. It is remarkable how both the speeches of the Member and his Secretary are in advance of the position maintained by the local Governments. Many of these took up the customary *non possumus* attitude. It is gratifying to find the Madras Government taking the most liberal view of the situation and undertaking, if necessary, to make an experiment in compulsion in advanced Municipal areas. The Central Provinces Government has definitely put forward the suggestion that the Local Self government acts might be modified so as to confer on Municipalities and District Boards, under proper safe guards, the power of making primary education compulsory in their areas. Though the difficulty as regards the necessary money may be enormously great, we think that, were it only to keep the idea in the forefront of our public work, our non-official representatives might try a knock at the door of local self-government. Possibly the country will wait till it knows the result of Mr. Gokhale's mission to England. Our own view is that if the present Liberal Ministry continues in undiminished power for another five years, there will be a compulsory education law in India in the time of the next

Viceroy, if the honour is not going to fall to Lord Hardinge. The opposition of certain Indian members is in sad contrast to the sympathetic attitude of the official opponents. Some Mahomedan members especially adopted a line of argument which could not but cast doubts on the representative character of the All-India Moslem League and its branches.

One gratifying feature of the discussion provoked by the Bill was the practical unanimity of local Bodies in support of compulsion. Local Governments with one or two exceptions had strangely overlooked their obvious duty to obtain and communicate formal opinions of Municipalities and District Boards on which the burden of working compulsion would fall under the Bill. And there was here and there an attempt made to belittle the support of these bodies where it was given, while at the same time much was sought to be made of such opposition as was heard occasionally.

Thus the Hon. Member for Education instanced as particularly instructive the adverse opinions of the Bombay Corporation and the Malabar District Board. Mr. Gokhale was not slow to take advantage of this reference and drew strength for his cause from the unequivocal support given by both these bodies to the principle of compulsion in India. Another polemical blunder made by Sir Harcourt Butler was a citation of the figure for literacy in Biroda which is lower than the corresponding figure for Breach. Surely an experiment in compulsion begun twelve years ago could not be expected to alter the illiteracy of all those persons who had passed school age. We have no space for referring to other features of the debate which were unusually rich in interest and instruction. But we must give a word to poor Mr. Dadabhoi whom some malignant fate delivered into the hands of an all-too-wary opponent. It was a scene which would live long in the memory of those who witnessed it. Mr. Dadabhoi was the very picture of humiliation. The short history

of Indian Legislatures knows no more solemn warning to those about to be lured by one cause or another from the straight path of principle.

[In this connection, we have no doubt our readers will be glad to read the full text of the speech delivered by the Hon. Mr. Gokhale in introducing his bill in the Viceroy's Legislative Council. *Ed I. R.:*—]

"My Lord, it is two years to-day to a day since this Council was invited in its very first session after the introduction of the recent reforms to consider a recommendation to the Governor General in Council that a beginning should now be made in the direction of making elementary education free and compulsory throughout the country, and that a mixed Commission of officials and non-officials should be appointed to frame definite proposals. After a lengthy debate, the motion was by leave withdrawn, but the principal suggestions formulated on the occasion were subsequently embodied in a Bill which was introduced in this Council about this time last year. A year has since elapsed, and during the interval, all sides—the Government and the public, officials and non-officials, members of all classes and creeds—have had time to examine the provisions of the Bill. I think the promoters of the measure are entitled to regard with the utmost satisfaction the reception which the Bill has met with in the country; for, my Lord, it is no exaggeration to say that no measure of our time has received such weighty, such enthusiastic, such overwhelming public support as the Bill now before the Council. My Lord, it has been made abundantly clear in the course of the discussions that have taken place during the year that most men of light and leading in the country—men distinguished in every walk of life, in learning, in professions, in business, in public affairs, in patriotic or philanthropic endeavour—are on the side of the Bill. The Indian National C

gress, the most representative body of educated opinion in India, has strongly supported the measure, and Provincial Conferences held in the different Provinces have also done the same. The Moslem League, whose claim to speak in the name of the great community which it represents is not disputed even by officials, accorded only a fortnight ago its cordial support to the Bill, and most of its branches throughout the country have also expressed their approval. Most of the local bodies consulted by Provincial Governments, as also the Senate of the Madras University, which was the only University Senate consulted, have expressed themselves in favour of the measure. Public meetings held in nearly every important town throughout the country have adopted resolutions in its support, and numerous special meetings of backward communities, several caste conferences and some missionary organisations have done the same. Then, my Lord, the Indian Press in the country with hardly an exception has with striking unanimity ranged itself on the side of the Bill, and what is even more significant, nearly half the Anglo-Indian Press, the *Indian Daily News* in Calcutta, the *Times of India* in Bombay, and the *Madras Mail* and the *Madras Times* in Madras, have also extended to it their valuable support. Last, my Lord, but not least, I must mention the important deputation—headed by no less a man than Lord Courtney—that waited last year on the Secretary of State and presented to him a memorial signed among others by some very distinguished men in England in support of this Bill. I venture to think that the ultimate success of a measure which has received such widespread, such influential, public support, is practically assured. The main opposition to the Bill has come from official quarters with which I will deal later. Here and there a few non-officials have also struck a note of dissent. But, my Lord, considering the far reaching character of the issues involved in the measure, and considering also how

the human mind is constituted, it is not to be wondered at that there has been this slight dissent; the wonder rather is that there should be this vast volume of public opinion in support of the measure. The non official critics of the Bill may roughly be divided into three classes. To the first class belong those very few men—so few indeed that they may be counted on one's fingers—who have rendered distinguished services in the past either to the country as a whole or to their own community, whose claim to be heard with respect on such questions is undisputed, and who, though not against free and compulsory education in the abstract, consider that the introduction of such a system in India at the present stage of the country's progress, even with such safeguards as are provided in the Bill, is not desirable. My Lord, these elderly ~~men~~ ^{men} have been cast in the mould of a previous generation, have not the elasticity to advance with the advancing requirements of the country, and we have got to face their disapproval of the present Bill with reluctance and regret. In the wake of these few elders follow a number of younger men, who unquestionably accept their lead in all matters, and who therefore withhold their support from the present Bill. The second class consists of those who cannot understand either the necessity or the value of mass education, to whom the dignity of man as man is an incomprehensible idea, and who regard the poorer classes of the country as made solely to serve those who are above them. My Lord, these men hold these views, because they know no better, but their opposition to this Bill is perfectly intelligible. In the third class come those who are against this Bill because the bulk of officials are understood to be against it. They are against this Bill either because the officials have so much to give or else because they are so constituted that official favour is to them as the breath of their nostrils and an official frown is a heavy misfortune, and because

they think nothing of bartering the birthright of our common humanity for something even less substantial than the proverbial mess of pottage. These, my Lord, are the three classes that are against this Bill. Taking all the non-official opponents of the Bill together, I think that their number does not exceed five per cent. at the outside of those who have expressed any opinion on the Bill.

"My Lord, special weight necessarily attaches first to the opinions of Local Governments, and next to those of Local bodies in regard to this Bill. Turning first to the local bodies, I regret that the opinions of all such bodies were not either ascertained or have not been forwarded to the Government of India. In view of the fact that, if the Bill became law, the initiative in regard to its working would have to come from local bodies, it was of the utmost importance to know what the local bodies had to say of the Bill. The Government of Madras is the only Government that has deemed it to be its duty to invite the opinions of all Municipalities and District Boards in the Province, and some of the district boards have in their turn invited the opinions of the Taluka Boards under them. The opinions thus elicited are appended to the letter of the Madras Government, and they afford overwhelming and incontestable evidence of the local bodies in Madras being strongly in favour of the Bill and being ready to avail themselves of its provisions if enacted into law. Of 61 Municipalities whose opinions have been recorded, 55 are in favour of the Bill. Of 24 District Boards, 20 are in favour. In addition, the opinions of 39 Taluka Boards have been ascertained, and they are one and all in favour of the Bill. The next Government in whose papers we find mention of a large number of local bodies in this connection is the Government of the Punjab, unfortunately, educationally the most backward Province in the whole country. Here we find that 60

Municipalities are mentioned by name, and of these 32 are in favour and 29 against. In addition, the Deputy Commissioner of Umballa wrote (the local bodies in Umballa are not included among these 60): 'The consensus of opinion appears to be strongly in favour of the principle of compulsion; the only Municipal Committee which does not favour compulsion was the Municipal Committee of Jagadhri.' The Deputy Commissioner of Hissar wrote: 'All the Municipalities of this District, as well as the District Board, have expressed themselves in favour of the Bill.' The Deputy Commissioner of Ferozepore wrote: 'I have consulted the District Board and the Municipalities in this district; they all consider the Bill fair, and are in favour of its being passed into law.' Nineteen District Boards are mentioned in the papers, of whom 6 are in favour of compulsion and 13 against. Considering the the extremely backward condition of primary education in rural Punjab, this is not surprising. Turning next to Bengal, we find mention made in the reports of local officers of about 25 Municipalities, of whom 19 are in favour and 6 against. Also there is mention of two District Boards, of whom one is in favour and one against. There is no mention of the remaining local bodies in the Bengal papers. In Eastern Bengal and Assam papers, we find 4 Municipalities mentioned of whom 3 are in favour; also 6 District Boards of whom 5 are in favour. For Burma the opinions of 16 Municipalities are given, of whom 9 are in favour. The letter of the Bombay Government mentions no local body, but the opinion of the Bombay Corporation was circulated among the members here only two days ago. However, in the report of the Commissioner of the Central Division which accompanies the letter, there is mention made of 6 Municipalities in that division all in favour. And we know for a fact that most of the Municipalities and a great many of the District Boards in Bombay are in favour of this

Bill. In the papers belonging to the United Provinces, only 2 small Municipalities are mentioned, both in favour. Here also we know from the newspapers that most of the Municipalities and a large number of the District Boards are in favour of this Bill. The Central Provinces papers mention only two local bodies—the Municipality of Nagpur and the District Board of Nagpur—of both which bodies my friend behind me is President. Both these bodies are in favour of the Bill. There are besides memoranda from five individual members of different local bodies, of whom four are in favour.

“Turning to what are known as the Presidency Municipalities, namely, Calcutta, Bombay, Madras and Rangoon, we find that Calcutta and Madras are strongly in favour of the Bill. Rangoon declines to express an opinion on the ground that it does not want to be saddled with any expenditure connected with elementary education. The Municipality of Bombay, while in favour of free and compulsory education, and while also in favour of the ultimate introduction of compulsion throughout the country, is unable to approve the special method which is advocated in the Bill, namely, that the initiative should be left to local bodies. But, my Lord, those who know the singular position which the Bombay Municipal Corporation occupies in regard to expenditure on elementary education will at once understand why that body has taken up that attitude. Under an agreement, which is now embodied in an Act of the local legislature, the Bombay Corporation has undertaken to bear the entire cost of primary education within municipal limits in Bombay on condition of being relieved of police charges, the only qualification being that if ever the Government introduces compulsory education in the country and requires the Bombay Corporation to introduce compulsion within its area, the Corporation should receive financial assistance from the Government similar to what other local bodies would receive.

The plain financial interest of the Bombay Corporation therefore is not in leaving the initiative to local bodies but in the initiative coming from the Government, and it is no surprise that the Corporation of Bombay is unable to approve of a method which leaves the initiative to local bodies. Before passing from this point, I would respectfully warn the Hon'ble Member in charge of Education against leaning on the opinion of the Bombay Corporation for support, for that Corporation, in addition to being in favour of the principle of free and compulsory education, wants the cost of it to come out of Imperial funds!

“Turning next to the opinions of Local Governments, I would like first of all to present to the Council a brief analysis of the official opinions that have been sent up by the various Local Governments. Among these papers, there are altogether 234 official opinions recorded; of them 90 are in favour of the Bill. Sixty-five of the 234 officials are Indian officials, and of them 39 support the Bill, some of them being very high officials, such as High Court Judges, District Magistrates, District Judges, and so forth. Of the English officials, there are 169 opinions recorded, of which 51 are in favour—a minority no doubt, but still, a very respectable minority.

“Before proceeding further, I think I had better explain what I mean by a person being in favour of the principle of the Bill so as to prevent misapprehension of the language which I am employing. My Lord, the principle of the Bill is to introduce compulsion at once in selected areas. Not all over the country, but in selected areas not at some remote time, but at once. To make a beginning at once in selected areas, the initiative being left to local bodies—that is the fundamental idea of the Bill. All else is a matter of detail. Some of the details are important, others unimportant. The question of a local education rate, the question whether education is to be absolutely free, or free for poor people only, the proportion

of cost which the Government is to bear,—all these are important matters, but matters of detail capable of adjustment when the final settlement of the scheme takes place. Now, all those who are in favour of the fundamental part of the Bill, I claim to be in favour of the Bill for my present purpose; all those, on the other hand, who cannot assent to it, against the Bill. Now, in Madras, the opinions of no European officials are given, the only exception being that of two European High Court Judges, who are both in favour of the Bill. In Bombay, out of 19 European officials consulted, 8 are in favour, one of them being the Director of Public Instruction, and 2 being Inspectors of Schools for the Presidency proper (the 3rd Inspector, an Indian, being also in favour), 2 Commissioners of Divisions out of 3 in the Presidency proper, and 3 Collectors. In Bengal, out of 21 European officers consulted 4 are in favour, all being District Magistrates. In Eastern Bengal and Assam, out of 21, 2 are in favour both being District Magistrates. In the United Provinces, out of 38 officers consulted, 6 are in favour, 1 of them being a High Court Judge, 1 a Commissioner, and 4 Collectors. In the Punjab, out of 38 European officers consulted, no less than 20 are in favour of the Bill—the largest proportion of European officers in favour of the Bill, thus strangely enough, coming from the Punjab. Among these 20, there is 1 Financial Commissioner, 1 Commissioner, 9 Deputy Commissioners, 5 Divisional Judges, 3 District Judges, and 1 Sub divisional Officer. In the Central Provinces only 4 official opinions are given, out of which 2 are in favour, both being Commissioners of Divisions. On the whole, my Lord, I claim that a very respectable minority of European officials is in favour of the measure. The officials who are opposed to this Bill may roughly be divided into three classes. First come a few Rip Van Winkles who appear to be sublimely unconscious as to what is going on not only in the rest of the world, but in India itself. To this class also belong a few cynics who do not understand the value of mass education, and who naively ask what good mass education has done anywhere. I was astonished to find among this class an Inspector of Schools in Madras. The very last that a kind Government can do for him is to transfer him to some more congenial Department, say the Department of Forests! To the second class belong those who see in a wide diffusion of elementary education a real danger to British rule; also those who are against mass education, because they are against all popular progress, and who

imagine in their short-sightedness that every step gained by the people is one lost by them. In the third class—and I am glad to say the bulk of the official opinions recorded belong to this class—are those who accept the necessity and the importance of mass education, who accept the policy which has been repeatedly laid down by the Government of India during a period of more than 60 years, but who do not recognise the necessity of compulsion at the present moment. They think that a great part of the educational field has to be covered on a voluntary basis, that compulsion would be inexpedient, and would lead to hardship, to discontent, and to danger. Some of them object to this measure on educational or on financial grounds. The outstanding feature of the official opposition to the Bill is however the fact that every Local Government that was consulted on this Bill has gone against the measure, and that makes it necessary that we should examine the opinions of Local Governments and the objections raised by them in some detail. The only Local Government that comes very near to supporting the principle of the Bill is the Government of Madras. Not that that Government does not regard the Bill as objectionable or argue against it. What distinguishes it, however, from the other Local Governments is that it does not ignore the strength of the case in favour of the Bill, and that it does not argue as though the heavens would fall if the Bill were passed into law. After urging several objections against the Bill the Madras Government says at the close of its letter that if the Government of India were disposed to accept this Bill, it would like it to be confined for the present to municipal areas only. The answer to that is that it would be entirely in the hands of the Government of India and the Local Governments to so confine it for the present. The Government of India could lay down such a proportion of school attendance to the total school-going population as a necessary preliminary test to be satisfied before compulsion is introduced, that thereby only Municipalities and not District Boards could for the present come under the Bill. Moreover, if any rural area wanted to try the measure, the Local Government could withhold its sanction. This opinion of the Madras Government, again, is the opinion of three members out of four. The fourth member, the late Mr. Krishnaswami Iyer, one of the most brilliant men of our day, a man whose untimely death has made a gap in the ranks of public workers in the country, which it will take long to fill, has written a masterly minute of dissent, giving his whole-

hearted support to the Bill and demolishing the objections urged by his colleagues against this measure. The next Local Government that comes, in a grudging manner and in spite of itself, to a conclusion not wholly dissimilar to that of the Madras Government is the Administration of the Central Provinces. After exhausting everything that can possibly be said against the Bill, that Government says in the end that if the Government of India wanted to try the Bill, it might be tried in a few selected municipal areas only. Only it does not want a general Act of this Council for the whole country, but it would like an amendment to be undertaken of the various Provincial Municipal Acts for the purpose, and it would lay down a condition, that only those Municipalities should be allowed to introduce compulsion which are prepared to bear the whole cost of compulsion themselves. Now, my Lord, if the object we have in view can be attained by amending Provincial Local Self government Acts, I for one have no objection whatever. All I want is that local bodies should have the power to introduce compulsion, where a certain condition of things has been reached, under the control and with the assistance of Local Governments. But I do not understand why the Central Provinces Government should lay down that condition that local bodies, wanting to introduce compulsion, should bear the entire cost themselves. I can understand a Local Government saying that it cannot finance any scheme of compulsion out of its own resources. But I cannot understand why the Central Provinces Administration should try to impose such a condition unless it be to punish those Municipalities which show special keenness for education in their areas. I am quite sure that that was not the meaning of the Local Government, and therefore I must frankly say I do not understand why this condition has been laid down. The Government of Bengal sees no objection per se to the principle of compulsory elementary education, only it thinks that, considering the apathy of the people at the present moment compulsion is not suitable. Moreover, it says, that if it is called upon to introduce compulsion in the near future, it will not be able to find the money out of Provincial revenues, and that it would be forced to look to the Government of India for assistance. The Governments of Eastern Bengal and the Punjab oppose the Bill merely on general grounds, the letter of the Government of Eastern Bengal being almost perfunctory in its treatment of the subject. The letter of the United Provinces Government is a document that might have been written

with some excuse 20 years ago. I cannot understand how a Provincial Government, at the beginning of the 20th century, can put forth arguments such as are contained in the letter of the acting Lieutenant Governor of the United Provinces. The Government of Burma opposes the Bill on grounds the very reverse of those on which other Local Governments oppose it. Other Local Governments oppose the Bill because there is not a sufficient advance made in the field of elementary education in their Provinces; but the Government of Burma opposes the Bill because there is already a sufficiently large advance of elementary education in that Province! The last Government that I would mention in this connection is the Government of Bombay. My Lord, this Government is the strongest opponent of the Bill, and I feel bound to say—though it hurts my Provincial pride to have to say so—that the very vehemence with which this Government argues the case against the Bill is calculated to defeat its own purpose, and that the terms of impatience in which its letter is couched, while not adding to the weight of the argument, only suggests a feeling of resentment that any non official should have ventured to encroach on a Province which it regards as an official monopoly. My Lord, it will be convenient to deal with the objections, which have been raised by the several Local Governments, all together. Before doing so, however, I think I should state briefly again to the Council the case for the Bill, so that members should see the grounds for and against the Bill side by side before them. My Lord, the policy of the Government of India in this matter, as I have already observed, is now a fixed one. The Government of India have accepted in the most solemn and explicit manner the responsibility for mass education in this country. The Educational Despatch of 1854, the Education Commission's Report of 1882, with the Resolution of the Government of India thereon, and the Resolution of Lord Curzon's Government of 1904, all speak with one voice on this point, namely that the education of masses is a sacred responsibility resting upon the Government of India. When we, however, come to consider the extent of the field which has so far been covered, I feel bound to say that the progress made is distinctly disappointing. Taking the figures for 1901, the beginning of this century, and that means after 50 years of educational effort, the number of boys at school in this country was only about 32 lakhs, and the number of girls only a little over 5 lakhs. Taking only 10 per cent,—not 15 per cent, as they take in the West

and as they do in official publications, even in India, taking only a modest 10 per cent.—as the proportion of the total population that should be at school, I find that in 1901 only about 27 per cent. of the boys and about $4\frac{1}{2}$ per cent. of the girls that should have been at school were at school! During the last ten years, elementary education has no doubt been pushed on with special vigour and the rate of progress has been much faster. Even so, what is the position to-day? From a statement which was published by the Education Department the other day, I find that the number of boys at school has risen during these ten years from 32 lakhs to a little under 40 lakhs, and the number of girls from 5 lakhs to a little under 7 lakhs. Taking the new census figures of our population, this gives us for boys a proportion of 31 per cent. and for girls $5\frac{1}{2}$ per cent. Taking the proportion of total school attendance to the total population of the country, we find that the percentage was only 1·6 ten years ago, and it is now no more than 1·9. My Lord, all the Local Governments have stated that we must adhere to the present voluntary basis for extending primary education, and the Bombay Government professes itself to be very well pleased with the rate at which it is moving in the matter. A small calculation will show how long it will take for every boy and every girl of school-going age to be at school at the present rate. I have stated just now that during the last ten years the number of boys at school has risen from 32 to 40 lakhs or a total increase in ten years of $7\frac{1}{2}$ lakhs, and the number of girls has risen from 5 to under 7 lakhs, or an increase of about $1\frac{1}{2}$ lakhs. This gives us an annual increase for boys of 75,000 and for girls of 17,000. Now, assuming that there is no increase of population in future—absolutely no increase of population—an obviously impossible assumption—even then at the present rate a simple arithmetical calculation will show that 115 years will be required for every boy and 665 years for every girl of school-going age to be at school! Even in Bombay, where things are slightly more advanced, it will take at least 75 years for every boy of school-going age between 6 and 10 years of age to be at school. Well might Mr. Orange, the late Director General of Education, who was in this Council two years ago, exclaim:—

‘If the number of boys at school continued to increase, even at the rate of increase that has taken place in the last five years, and there was no increase in population, several generations would

still elapse before all the boys of school-going age were at school.’

“And well might my late lamented friend Mr. Krishnaswamy Iyer of Madras, after a similar examination of the figures for that Presidency, observe in terms of sorrow:—‘The voluntary method of persuasion must be condemned as a hopeless failure.’

“My Lord, this then is the position. The Government of India are committed to a policy of mass education, and the rate at which we have been going for the last 60 years is hopelessly slow. Even at the accelerated pace of the last ten years, it will take enormously long periods for every boy and every girl to be at school. Moreover, this does not take into account the natural and necessary increases of population in the country. What then is to be done? Are we going to content ourselves with experiments of our own only, experiments which can only prolong the reign of ignorance in the country? My Lord, India must profit by the example and by the experience of other civilized countries. And other civilized countries have come to only one conclusion in this matter, and that is that the State must resort to compulsion in order to secure universal education for the people. Most of the civilized Western countries have accepted this, and I have already given to the Council, when introducing this Bill, statistics showing what progress they have made under a system of compulsory education, and how India compares with them. There are also the examples nearer India, of which I have spoken—examples of the Philippines, of Ceylon and of Baroda—which are of the utmost importance, and the mere assertion that their circumstances are different from those of British India cannot dispose of them. Of course no two cases can be exactly alike. But what you must show is that their circumstances are so different that what has succeeded in their case will not succeed in ours. And till you show this, we are entitled to say that the experiment which has succeeded elsewhere should also be tried in India. I do not see what difference there is between the population of Ceylon and the population of the Southern Presidency or between the population of Baroda and the population of British Gujerat. Therefore, those who argue that these analogies will not do on the score that the circumstances are different, will have to establish the difference they speak of and not merely content themselves with the assertion that the cases are different. Moreover, I will mention to-day—
—an instance which I was not able

in my opinion, should be one-third for local bodies and two-thirds for Local Governments, the actual proportion, however, being laid down by the Government of India, and additional funds being placed by the Supreme Government at the disposal of Provincial Governments for meeting the Government share of the cost. The Bill proposes to exempt very poor people from the payment of fees as a matter of right, and in all cases local bodies, which are empowered to levy a special education rate, if necessary, will be at liberty to remit fees altogether. The responsibility for providing adequate school accommodation is thrown on local bodies, who will also have to arrange for a reasonable enforcement of compulsion. The curriculum must be approved by the Education Department of the Local Government, and finally, following the example of the compulsory Acts of other countries, provision is made for absence from school for reasonable excuses and penalties provided for wilful absence without reasonable excuse.

"This, my Lord, is the Bill, and this is the case for the Bill. I will now proceed to consider the more important objections which the different Local Governments have urged against this Bill, as also those that have been urged by some non-official critics. I will dismiss with very few words the objection that a spread of mass education in British India involves danger to British rule. My Lord, I do not believe that there would be any such danger. My own belief is that it is rather the other way, that there will be danger not from the spread of education, but from the withholding of education. But, my Lord, even if there is a possible element of danger in the spread of education, it is the clear duty of the British Government to face that danger and to go on with a faithful discharge of their responsibility. I do not think that any sane Englishman will urge that the people of this country should pay the price of perpetual ignorance for even such advantages as the most enthusiastic supporter of British rule may claim for it. Leaving therefore that objection aside, there are seven objections to which I would like briefly to refer. The first objection is to compulsion itself. The second objection is urged on educational grounds. The third is on the score of the cost of the scheme. The fourth is on account of alleged financial inequality and injustice in which the scheme would result. These four are official objections. Then there are three non official objections. The first is to the levy of a special educational rate; the second to the levy of fees from parents whose

income is not below Rs. 10 a month; and the third is the Muhammadan objection that the provisions of the Bill may be used to compel Moslem children to learn non-Moslem languages. I will answer these objections briefly one by one. The principal argument of those who are against compulsion is that there is plenty of room yet for work on a voluntary basis; that schools are filled as soon as they are opened, thus showing that the need of the situation is more schools and not compulsion; and that in any case till persuasion is exhausted, it is not desirable to go in for compulsion. Now, my Lord, this statement is not a complete statement of the case. It is quite true that in certain places, as soon as schools are opened, they are filled. But there is also ample official evidence to show that in many areas schools have had to be shut down because children would not come. We find a statement to this effect in the United Provinces official papers. Mr. Maynard of the Panjab in a most thoughtful opinion recorded on the Bill, says:—'It will very frequently be found that a perfectly genuine demand for a school on the part of a zealous minority does not guarantee an attendance after the school is provided, and it is occasionally necessary to close for this reason schools which have been opened on too sanguine a forecast.' In Bengal and Eastern Bengal also several zamindars have complained that though they opened free schools on their estates it was found difficult to get boys to attend them, because of the great apathy among the people. The real fact is that there are two factors, as Mr. Orange has stated in the last quinquennial report on education, that cause the smallness of school attendance. One is undoubtedly the want of schools. But the other is the apathy of parents, even where schools exist. 'The apathy of the populace,' says Mr. Orange 'towards primary education is often mentioned and does undoubtedly operate as a cause which keeps school attendance low.' He admits this, though he himself would like to push on education for the present on a voluntary basis only. Now, the remedy for this state of things must also be twofold. First of all local bodies must be required to provide the necessary educational facilities for children that should be at school—school-houses, teachers, etc. That is one part of compulsion. Then they must be empowered to require parents to send their children to school—that would be the second part of compulsion. Now, my Lord, this Bill advocates both sides of this two-fold compulsion. It not merely requires parents in the areas where the Bill may be introduced to send their children to school, it also throws a definite responsibility

on local bodies coming under the Bill to provide the necessary school accommodation and other facilities for the education of all the children within their area. Then it is said that compulsion would cause hardship, would cause discontent, and would prove dangerous. Well, the experience of other countries and as also in our own does not justify this view; and in any case, even if there is some discontent, that has got to be faced in view of the great interests that are involved in this matter. It is argued by some that the poorer people will be exposed to the exactions of a low paid agency if compulsion is introduced. I think the fears on this subject are absurdly exaggerated. But if the people are so weak as to succumb easily to such exactions, the only way in which they can be strengthened is by spreading education among them and by enabling them to take better care of themselves.

"Those who object to the Bill on educational grounds urge that it is undesirable to extend the kind of education that is at present given in primary schools, for it is worse than useless. Most of the teachers are not trained teachers, the school buildings are unfit for holding classes in, and therefore, until these defects are moved, until there is a sufficient supply of trained teachers forthcoming, until ample decent school accommodation is available, the question of extension should wait. My Lord, those who raise the objections ignore what is the primary purpose of mass education. The primary purpose of mass education is to banish illiteracy from the land. The quality of education is a matter of importance that comes only after illiteracy has been banished. Now, the primary purpose being to banish illiteracy, teachers who could teach a simple curriculum of the 3 R's, and houses hired by or voluntarily placed by owners at the disposal of school authorities, must do for the present. In Japan, when they began compulsion, they held classes in the verandahs of private houses. I think what was not beneath the dignity of Japan need not be beneath the dignity of this country. Of course I do not depreciate the value and importance of trained teachers and decent school houses; but I say that we cannot wait till all these defects are first put right before taking up the question of banishing illiteracy from the land. Let that work be resolutely taken in hand, and as we go along let us try to secure for the country better teachers and better school houses.

"The third objection to the Bill is on the score of cost. My Lord, a lot of wild criticism has been indulged in by the opponents of the Bill on this

point. Nobody denies that the cost of a compulsory scheme is bound to be large. But all sorts of fantastic estimates have been brought forward to discredit the scheme in the eyes of those who can be misled by such tactics. I think the calculation of cost is a fairly simple one. The Bill is intended to apply in the first instance to boys only, and we will therefore for the present take the cost for boys. Taking 10 per cent of the total male population as the number of boys between the ages of 6 and 10, and taking the male population at about 125 millions, according to the latest Census we find that the number of boys that should be at school is about 12½ millions. Of these, about 4 millions are already at school. That leaves about 8½ millions to be brought to school. Now Mr. Orange, the Director General of Education, in a note which he prepared for the Government, took the average cost of education per boy at Rs. 5, the present average cost is less than Rs. 4; the highest is in Bombay where it is Rs. 6.8 and everywhere else it is less than Rs. 4. These figures are given in the quinquennial report of Mr. Orange. Mr. Orange takes Rs. 5 per head, and I am willing to take that figure. Now, Rs. 5 per head, for 8½ millions of boys amounts to about 4½ crores per year, or, say, 4½ crores per year. I propose that this cost should be divided between the Government and the local bodies in the proportion of two thirds and one third, that is, the Government should find 3 crores and local bodies the remaining 1½ crores. This again will be worked up to in ten years. If we have to find this money in ten years, it means a continuous increase of about 30 lakhs in our annual expenditure on primary education. Allowing another crore for pushing on education on a voluntary basis for girls, to be reached in ten years, means another 10 lakhs a year, or a continuous annual addition of 40 lakhs of rupees in all. Now, I do not think that this is too much for the Government to find. My Lord, I have given some attention to the question of our finance for some years, and I do not think that an addition of 40 lakhs every year is really beyond the power of the Government of India. Moreover, even if it be proposed that the whole of those 4 crores should be raised straight off, that all boys should be brought to school compulsorily at once, and that a crore of rupees more should be spent on the education of girls—assuming that these four crores have to be found straight off, an addition of 2 per cent to our customs will solve the problem. Our customs-revenue is about ten crores this year with the duty standing at 5 per cent, about 2 per cent more will bring us the

required 4 crores. Now, there is no special merit in having our customs-duty at 5 per cent., and they might as well stand at 7 per cent. without causing any serious hardship to anybody. There was a time when they stood at 10 per cent. in this country, and at the present moment they are at 8 per cent. in Egypt. I do not think therefore that there are really any very insuperable difficulties in the way of the scheme on the score of cost.

"Then, it is said that a scheme like this, a permissive scheme, which allows areas to come under compulsion one by one, is bound to result in serious financial injustice and inequality as regards the assistance received from Government by different local areas. Now, my Lord, I feel bound to say that this is one of the flimsiest arguments that have been urged against the scheme which we are considering. If any body proposed as a permanent arrangement that elementary education in certain parts of the country should be on a compulsory basis and in certain others on a voluntary basis, and if the areas that were on a compulsory basis got more from Government than the areas that were on a voluntary basis, there would be some force in the contention that different areas were being differently treated. But the arrangement that I propose is clearly transitional; in the end every part of the country is to rest on a compulsory basis and would share equally in the allotment made by Government. In a transitional stage, provided the same terms are equally open to all, I do not see where the injustice or inequality comes in. If a local body feels aggrieved that some other local body gets more than itself from Government, the remedy is in its own hands. All that it has got to do is to go in for compulsion itself. Those who object to the proposed scheme on the score that it would lead to financial inequality and injustice might object at once to the principle of introducing compulsion gradually area by area. For how are we to proceed area by area, unless those areas that introduce compulsion first get also at the same time larger assistance from the Government?

"Moreover, is there absolute equality even at present in all matters? Even now, on a voluntary basis, the Government in many parts of the country, bears about one-third of the cost of primary education, with the result that those areas that spend more get more from the Government, and those that spend less get less. Is that equal?

"Again, take the question of sanitary grants. Under the existing arrangements, those local

bodies that go in for the construction of sanitary projects get a certain grant from the Government. Now, if the local bodies that do not take in hand such projects were to complain of injustice, because others that do are assisted by Government, their complaint would be perfectly ridiculous, and yet it is the same kind of complaint that is urged against the scheme of the Bill. I do not think that any weight need really be attached to the objection on the score of financial injustice and inequality when it is remembered that such inequality can only be a passing, transitional stage. It is said that under the Bill, advanced areas and communities would be benefited at the expense of the less advanced. That argument is based on a complete misapprehension of the scheme. No one has ever suggested, or can possibly suggest, that any money should be out of existing expenditure on primary education for its extension on a compulsory basis. No one can also possibly wish to curtail future increases in the allotments to education on a voluntary basis. The expenditure for introducing compulsion is to come out of additional revenues, partly raised locally and partly raised specially by the Government of India. The Government of India's funds will have necessarily to pass through the Local Governments, since education is a Provincial charge. But that does not mean that Provincial Governments, will have to curtail their present or future expenditure on a voluntary basis to finance any scheme of compulsion.

"My Lord, I have so far dealt with the four principal official objections against the Bill. I will now refer very briefly to the three non-official arguments which I have mentioned. The first argument is that while there is no objection to compulsion itself, the levy of a special education rate, where it would be necessary, would be most objectionable. Well, my Lord, I must say to that, that if we merely want compulsion, but are not prepared to make any sacrifices for the benefits that would accrue from it to the mass of our people, the sooner we give up talking about securing universal education, the better. The practice of the whole civilized world points out that a part of the burden must be borne by the local bodies. There is only one exception as far as I am aware, and that is Ireland, where almost the entire cost of elementary education comes from the Imperial Exchequer. They have given this special treatment to Ireland because for a long time Ireland has complained of being treated with great financial injustice under the arrangement that has been in existence since the Act of Union was passed.

ed more than a century ago. If we take the whole of the United Kingdom, we find that the local bodies there bear on the whole about a third of the total cost. It is the same in France. And in other countries, the local proportion is still larger. I cannot therefore see how anybody can reasonably urge that the whole cost of compulsion should be borne by the Central Government.

"The next objection urged in some non official quarters is that if you make education compulsory, it must be made free and the Bill does not make it free for all. I frankly confess that the proposal embodied in the Bill on this point was intended to conciliate official opinion. My own personal view always was that, where education was made compulsory, it should also be made free. Two years ago, when I placed my Resolution on this subject before this Council, I urged that view in explicit terms. In framing the Bill, however, I was anxious to go as far as possible to conciliate official opinion, and I therefore put in the provision that no fees should be charged in the case of those whose incomes were below Rs 10 a month, and that above that limit the matter should be left to the discretion of local bodies. Well, my Lord, I must frankly admit that I have failed in my object. Official opinion has not been conciliated; and I do not see why I should allow room for a division in our own ranks by adhering to this provision. I shall therefore be glad to go back to my original proposal in this matter that, where education is compulsory, it should be also be free.

"Lastly my Lord a word about the Mahomedan objection. I believed I need not say that there never was any intention that the compulsory clauses of the Bill should be utilized to compel Moslem boys to learn non Moslem languages. However, to remove all misapprehension on this point, I am perfectly willing that where 25 children speaking a particular language attend a school, provision should be made for teaching those children in that language; and further, where the number is less than that, it should be left to the community itself to say whether the children should come under the compulsory clauses of the Bill or not. I have discussed this matter with several leading Muhammadan gentlemen and I understand that this would meet their view.

"My Lord, I have now dealt with all principal objections urged against the Bill. I cannot understand why there should be all this vehement opposition in certain quarters to a measure so modest in its scope and so permissive in its character. No local body is compelled to come under this Bill, that wants to keep out of it. Any

Local Government that wants to prevent compulsion being introduced in any particular area, can prevent it by withholding its sanction to its introduction. And, lastly, the supreme control of the Government of India is retained at the initial stage by the provision that it is the Government of India that should lay down the proportion of school going children at school which must be satisfied before any local body can take up the question of compulsion. I cannot see how such a Bill can do harm in any locality. I would only invite the attention of the Council to the fact that at least a hundred municipalities, more or less important, are willing to-day to try the experiment in their areas if this Bill is passed, and I do not see why these Municipalities should not be permitted to make the experiment. Of course the whole thing hinges on whether the Government of India are prepared to find a good part of the cost. That is, in fact, the real crux of the question, and whether the Bill is accepted or thrown out, it is perfectly clear that no large extension of elementary education is possible in the country, unless the Government of India come forward with generous financial assistance. I would therefore like to make a special appeal to the Hon'ble Member in charge of Education on this occasion. My Lord, the Hon'ble Member knows that no one has acclaimed more enthusiastically than myself the creation of the Education Department, and I am sure every one will admit ungrudgingly that during the year and a half that the Department has been in existence, it has already amply justified its existence by the large grants, recurring and non-recurring, that it has succeeded in securing both for education and sanitation in this country. We are sincerely grateful to the Government of India for these grants. And, my Lord, in view of the conversation with Your Excellency which was mentioned by the Finance Member the other day, I think we are justified in expecting that in succeeding years these grants will grow more and more, and not less. Well, so far I believe we are all at one with the Department, but I would like to say something more to the Hon'ble Member. My Lord, I know that the fate of my Bill is sealed. Now, there are obvious disadvantages attaching to a private Bill. Why not introduce a Government measure, after the ground has been cleared by the rejection of this Bill? Why not—I put it to the Hon'ble Member—introduce a Government measure? It is quite true that there is room for progress on a voluntary basis. Let the Local Government who are so anxious to keep education

on a voluntary basis be required to push on its spread as vigorously as possible on a voluntary basis. And let the Government of India in the Education Department take up the question of pushing it on on a compulsory basis, as its own special charge. I would like to put it to the Hon'ble Member, Is he content merely to take grants from the Finance Department and distribute them among the various Local Governments and then look on, or is he not anxious, as I think it is his duty, to take a hand in the game himself? If he is, then I suggest that there should be a division of functions such as I have described between the Provincial Governments and the Government of India. The progress of education on a voluntary basis should be left to the Provincial Governments. They do not want compulsion. They all prefer to push it on a voluntary basis. Let us then leave that work to them; let the Government of India, with its wider outlook and its larger resources, come forward, and, profiting by the example of other civilized countries, provide for the gradual introduction of compulsion in this country. Let the Government take up the question of compulsion themselves, then they will be able to provide all the safeguards that they deem necessary. Let them frame a Bill free from all the blemishes which have been discovered in mine, and let them carry it through the Council. And let them, at the same time, announce a generous policy of substantial assistance to local bodies in carrying out the provisions of the measure. Let the Government, my Lord, let this be done and let the burden of all future extensions be shared between the Government and the local bodies in the proportion of two-thirds and one-third. I would recommend that both for voluntary and compulsory extensions—I mean Provincial Governments should bear two-thirds of the cost of all future extensions of elementary education on a voluntary basis, and the Government of India, two-thirds of the cost of compulsion. Then, my Lord, elementary education will advance in this country with truly rapid strides, and the Honourable Member in charge of the Education Department will, under Your Excellency, write his name large on the memory of a grateful people.

"My Lord, I have done. No one is so simple as to imagine that a system of universal education will necessarily mean an end to all our ills, or that it will open out to us a new heaven and a new earth. Men and women will still

continue to struggle with their imperfections, and life will still be a scene of injustice and suffering, of selfishness and strife. Poverty will not be banished because illiteracy has been removed, and the need for patriotic or philanthropic work will not grow any the less. But with the diffusion of universal education the mass of our countrymen will have a better chance in life. With universal education there will be hope of better success for all efforts, official or non-official for the amelioration of the people—their social progress, their moral improvement, their economic well-being. I think, my Lord, with universal education the mass of the people will be better able to take care of themselves against the exactions of unscrupulous money-lenders or against the abuses of official authority by petty men in power. My Lord, with 94 per cent. of our countrymen sunk in ignorance how can the advantages of sanitation or thrift be properly appreciated, and how can the industrial efficiency of the worker be improved? With 94 per cent. of the people unable to read or write, how can the evil of superstition be effectively combated, and how can the general level of life in the country be raised? My Lord, His Majesty the King-Emperor, in delivering his message of hope to the people of this country before he left Calcutta, was pleased to say: 'And it is my wish too that the homes of my Indian subjects may be brightened and their labour sweetened by the spread of knowledge, with what follows in its train—a higher level of thought, of comfort, and of health.' No nobler words were ever uttered. May we not hope that the servants of His Majesty in this country will keep these words constantly before their minds and will so discharge the responsibility which they impose that future generations in this country will be enabled to turn to His Majesty's declaration with the same fervent and reverent gratitude with which the people of Japan recall their Emperor's famous rescript of 1872? My Lord, I know that my Bill will be thrown out before the day closes. I make no complaint. I shall not even feel depressed. I know too well the story of the preliminary efforts that were required even in England, before the Act of 1870 was passed, either to complain or to feel depressed. Moreover, I have always felt and have often said that we, of the present generation in India, can only hope to serve our country by our failures. The men and women who will be privileged to serve her by their successes will come later. We must be content to accept cheerfully the place that has been allotted to

us in our onward march. This Bill, thrown out to-day, will come back again and again, till on the stepping stones of its dead selves, a measure ultimately rises which will spread the light of knowledge throughout the land. It may be that this anticipation will not come true. It may be that our efforts may not conduce even indirectly to the promotion of the great cause which we all have at heart and that they may turn out after all to be nothing better than the mere ploughing of the sand of the sea-shore. But my Lord, whatever fate awaits our labours, one thing is clear. We shall be entitled to feel that we have done our duty, and, where the call of duty is clear, it is better, even to labour and fail than not to labour at all.

THE HOME RULE BILL.

BY MR. P. N. RAMAN PILLAI.

Editor, Weekly Chronicle

THE Prime Minister has introduced his Bill for the better Government of Ireland into the House of Commons, and it has passed through its first stage. The House does not ordinarily divide on the First Reading of a Bill. The trial of strength is almost invariably reserved for the Second Reading. But Mr. Asquith's Bill has had to pass through the ordeal of a division at its introduction. It does not, however, appear that the occasion was marked by any great excitement. As has been said, the question has passed from the heroic to the practical stage, and whatever their reconcilables from Ulster may say or do, before long a separate Parliament will be established in Dublin to deal with purely Irish affairs. During the agitation that followed Mr. Gladstone's conversion to Home Rule, Lord Randolph Churchill declared, with the vehemence of speech characteristic of him, that Ulster would fight and Ulster would be right. But then Ulster had England on its side, and, as Lord Rosebery once said, so long as the predominant partner stood aloof, no scheme of Home Rule for Ireland had a chance. Home Rule has to-day no terrors for

England. On three successive occasions since 1906 the party which has given Home Rule for Ireland the principal place in its programme was returned to power, though each time the party opposite sought in vain to influence the country's verdict by raising, in all its grim reality, the cry against Home Rule. But the electors were not in a mood to be frightened. They have begun to realise the benefits of the policy of devolution. "Home Rule all round" has long ceased to be a dream of the visionary. Practical politicians and political theorists alike see that the scheme is worth considering. Self government granted in time has cemented and strengthened Imperial Union; and although it was the fashion at one time to scoff at Mr. Gladstone's analogies, the wisdom of the course he asked his countrymen to pursue is now being widely recognised.

In his speech Mr. Asquith referred to the historic case between England and Ireland. The history of Ireland, since the Union, was almost a succession of political storm and tempest. In the early fifties of the last century an attempt was made by the representatives of Ireland to get the Act of Union repealed. But British statesmen were not then in a frame of mind to listen sympathetically to the Irish demand. They and their successors in after years tried all manner of palliatives—without effect. Mr. Gladstone himself began the work of pacification and conciliation in 1868. In that year his Bill for the Disestablishment of the Irish Church was passed into law. He then took up the land question and dealt with it in a manner conducive to the interests of the Irish peasantry. Other measures of a like kind followed; but they left Ireland as discontented as ever. Mr. Gladstone had opportunities of studying the Irish question at close quarters in all its phases, and his receptive and growing mind was gradually being awakened to the necessity and the expediency of giving self government to

Ireland—of governing Ireland according to strictly Irish ideas.

Soon after the defeat of his Government in 1885, he placed on record his conviction that something must be done to solve the Irish problem. He was anxious that both the great parties in the State should come to a common understanding; and when Lord Carnarvan, the Lord-Lieutenant of Ireland in Lord Salisbury's Ministry, expounded his policy, no one was more pleased with it than Mr. Gladstone. But Lord Salisbury and his colleagues practically threw Lord Carnarvan overboard and pursued a different policy. On the defeat of Lord Salisbury's Government the usual appeal to the country followed. Mr. Gladstone again came back to power. He saw that the psychological moment had come and announced his intention of introducing a Home Rule Bill for Ireland. Some of his most prominent colleagues like Lord Hartington from conviction and others like Mr. Chamberlain from other causes left him. But the bulk of the Liberal party stood by their leader, and in 1886 the first Home Rule Bill was introduced into the House of Commons. The opposition to the measure was strong and overwhelming, and on the Second Reading it was thrown out. Mr. Gladstone and his colleagues resigned and a dissolution followed, with the result that Lord Salisbury was returned to power with a large majority.

The years that succeeded were years of heroic struggle. The Liberals had taken the plunge. They had made their choice; and what was till 1886, more or less an academic question, a question for the irresponsible politician to employ his spare hours with, was drawn within the range of practical politics. Nearly for seven long years, amidst abuse and misrepresentation of every description, Mr. Gladstone toiled on till at last in 1892, he was again installed in office, for the fourth time, as Prime Minister of England. Long was the way and hard was the fight, and the veteran statesman was

again given an opportunity to do justice to Ireland. He declared that Ireland was the only link that connected him with public life; and it gladdened his heart to know that after all the Irish question was nearing solution. In 1893, soon after Parliament re-opened, he introduced his second Home Rule Bill. In spite of the determined resistance offered to it at every stage by its opponents, the House of Commons passed it. In the usual course it was sent up to the House of Lords; but, at the instance of Lord Salisbury, that House rejected the Bill. But the Home Rule Bill was only one of the Liberal measures then destroyed by the Peers. Though verging on to his 84th year, the great statesman who foresaw the future at once initiated a campaign against the House of Lords. It is a significant circumstance that the last speech he delivered in the House of Commons was, as Mr. Balfour characterised it, a declaration of war against the House of Lords. Liberal legislation, said he, had no chance, so long as the issues raised between the two Houses were left unsettled, and he asked his followers to fight them out. But the years that followed were years of Tory ascendancy. The South African War, the dissensions in the Liberal party and the retirement and the subsequent death of Mr. Gladstone made it impossible for the Liberal Party and its recognised leaders to do anything in the direction indicated by their departed chief. Nothing indeed was even attempted between the years 1894—1906. However, the hour came in 1906. In that year, the Liberals with the late Sir Henry Campbell-Bannerman as their leader, were returned to power with an unprecedentedly overwhelming majority. But they could not do anything then to solve the Irish question. Arrears had already accumulated and the cessation of the war in South Africa made it incumbent upon them to devise a system of government for that new portion of the British Empire. In carrying several important pieces of domestic legislation through Parliament, Sir Henry Campbell-Bannerman himself experienced difficulties, and he moved a resolution in the House of Commons by way of a warning to the Lords. In the meantime, Sir Henry himself fell sick, withdrew from the Prime-Ministership, only to die a few days afterwards. Mr.

Asquith succeeded him and reconstructed the Cabinet, Mr. Lyod George becoming Chancellor of the Exchequer. The new Chancellor of the Exchequer introduced his famous democratic Budget which, for the time being, absorbed public attention to the exclusion of every other subject. The House of Commons passed the Budget; but the Lords threw it out. Upon the issue raised by the latter as regards their right to interfere with the finances of the nation, an appeal was made to the country, which resulted in the complete discomfiture and over-throw of the Lords and the triumphant return of the Liberals back to power. In the new circumstances, the House of Lords had no alternative but to pass the Budget. But the controversy raised by the House of Lords could not rest there. The Liberals wanted to define and curtail the powers of the House of Lords. But the lamented death of His Majesty the King Edward VII. occurred, and both parties agreed that at the outset of a new reign there should not be any bitter political controversies such as would mar the harmony and peace of the land. There was therefore a truce. The disputed points were referred to a Conference consisting of the recognised leaders of both parties. The Conference sat and deliberated and in the interval the Coronation of the new King Emperor had also taken place. The considerations which influenced the two parties to arrive at a common understanding had all disappeared and the Constitutional Conference, as it was called, broke up without coming to any conclusion. Mr. Asquith forthwith introduced his Parliament Bill into the House of Commons; and a few days after, he dissolved Parliament with a view to take the opinion of the electors on the merits of his Bill. He was again returned to power, and among the measures he invited Parliament to pass was the Parliament Bill. It easily got through the several stages in the House of Commons. When it went up to the House of Lords there was a show of resistance, but ultimately that House yielded and the Parliament Bill was passed into law. The Parliament Act has materially curtailed the powers of the Lords; and when they passed it they knew that the Government would embrace the earliest opportunity to bring in their Home Rule Bill; and true to his pledge Mr. Asquith has now introduced his Home Rule Bill into the House of Commons.

The main provisions of the Bill are simple enough. Ireland has asked for a separate Parliament to deal with purely Irish affairs, making the

Irish Executive responsible to that Parliament. The new Bill establishes an Irish Parliament consisting of a Senate and a House of Commons. This Parliament would have powers to pass laws for the peace, order and good government of Ireland, subject to the supreme authority, in Imperial matters, of the Parliament sitting in London. In Mr. Gladstone's Bills, certain subjects were excluded from the scope of the Irish Parliament. In the present Bill a few more subjects are added to the list of excluded subjects, with reference to which the Irish Parliament has no authority. Nor could it alter or otherwise interfere with the Act which establishes it. The Senate is to consist of 40 nominated members and the House of Commons 64 elected members. The Senate would be nominated, in the first instance, by the Imperial Executive for a fixed term, but as they retire in rotation vacancies will be filled up by the Irish Executive. It is provided that where there is disagreement between the two Houses, following the South African precedent, they would sit together and vote. The head of the Irish Executive will, as now, be the Lord-Lieutenant who will hold office for a fixed term. The Lord-Lieutenant has powers to veto or suspend a Bill passed by the Irish Parliament on the instruction of the Imperial Executive. He himself is appointed to the office by the Crown on the recommendation of the Imperial Government; so that between the Imperial Government and the Lord-Lieutenant they are able to protect the interests of the minority against any hasty or ill-considered action on the part of the Irish Parliament. Besides, it is provided that any question of the interpretation of the Home Rule Act and its application is to be settled by appeal to the Judicial Committee of the Privy Council in England. The financial portion of the Bill has provoked lively discussion. We shall know the details only after the arrival in this country of the text of the Bill, together with a full report of Mr. Asquith's speech explaining it. Whatever defects there may be in the Bill, will all be removed in Committee. The Liberal party, as a whole, the Irish Nationalists and the Labourites have accepted the main provisions of the measure. There can, therefore, be no doubt that the House of Commons will accept it. If the Lords reject it, Mr. Asquith will surely make use of the provisions of the Parliament Act to get his Bill passed into law.

Commercial Education in Madras.

BY .

MR. C. GOPAL MENON.

THE question of the kind of Education best suited to business pursuits, and how to provide it, has occupied a large share of public attention everywhere during the past twenty-five years. This is evident from the utterances made from time to time by men of light and leading in England. Sir Albert Rollit, M. P., as President of the London Chamber of Commerce and Chairman of its Commercial Education Committee gave utterance to a popular demand for a better adaptation of Education to the wants of the day, especially among the manufacturing and commercial classes. Lord Curzon, presiding at one of the annual meetings of the London Chamber of Commerce, has shown that the prosperity of a country by trade and commerce will depend on the attention paid to the commercial and technical Education. Lord Rosebery has pointed out that the twentieth century is destined to witness a struggle for Commercial predominance between the trading nations of the world and their success will depend on their Educational superiority. The effect of these utterances is seen at the present day in the establishment of Commercial Universities for the study of higher Commercial subjects including Economics. The stir thus roused on Commercial Education gave an opportunity for its powerful claims to a distinct place in the education of the citizen. If there should be any narrowness of spirit in viewing the importance of Commercial Education it can only be attributed to its effecting a reactionary measure in education from the methods of the past. The commercial progress of the countries throughout the world is attributed to the high level which commercial education has attained. In Germany there are about fifty-five institutions devoted to

Commercial Education, all on the pattern of the Leipzig Commercial Institute. This school is managed by the Chamber of Commerce, and gives the very highest mercantile education. The Commercial College and University of Leipzig aims at the provision of education and studies of University rank, having for its object a broader field than both the highest and ordinary Commercial School, and seeks to eliminate, as far as possible, merely utilitarian considerations. Apart from these older Commercial Colleges, there is the Berlin Commercial High School which was started in 1906. The aims of these new Schools are to give young men intending to adopt a Commercial profession a thorough and general education in Higher Commercial subjects, and to give the Young commercial lecturers an opportunity of acquiring the necessary theoretical and practical professional training. They are intended to train young administrative officers and Consular officials, Board of Trade Secretaries, &c., and to give them an opportunity for acquiring a professional knowledge of commerce—in fact, their aim is to provide men intended for a business career a chance of perfecting themselves in different branches of mercantile knowledge. In these commercial schools, leading economists of advanced views—men of the type of Messrs. Schmoller, Wagner, Sering and Jastrow—lecture on the Agrarian and Tariff questions. Berlin Commercial School is now becoming a teaching centre of all German economists and jurists.

France has nearly a dozen Commercial Colleges of the very best type and many of lower grades. In Paris there are the Superior School of Commerce and the School of Higher Commercial Studies. The two Schools of Commerce in Paris conducted by the Paris Chamber of Commerce—L'Ecole des Etudes Commerciales, L'Ecole Superior de Commerce, give the highest instruction in Commerce, having a museum attached to them, together with ex-

cellent physical and chemical laboratories and apparatus. A writer in the *Forum* states that these two Paris Colleges really form a Commercial University and the commercial education imparted is of the very highest type. At Antwerp and Brussels, there are Commercial Colleges of the very best type.

The Antwerp Institute itself is, except in name, a Commercial University, giving the highest education, at a very moderate cost, encouraged by travelling and other scholarships.

In these Colleges, the curriculum covers a wide range, the Laws of Commerce, Mathematics, Industrial and Commercial Geography, Transportation, Tariffs, History, Political Economy, Credits, Corporations, Accountancy, Foreign languages and various other branches.

There are excellent Commercial Universities in America at the present time and the alertness and inventiveness so characteristic of American business men may be regarded as the product of a liberal education adapted to commercial needs. In the year 1890, there was only one institution, the Wharton School of Finance and Economy of the University of Pennsylvania, teaching commercial subjects of the University type. Since then every encouragement was afforded for providing special education for mercantile and business life by the United States Educational Department and to establish Colleges and Universities similar to Wharton School.

What is the best Education for a business man, and how can it be practically attained in England, has engaged the attention of business men since the early eighties. The problem is entirely modern, because the need is modern. Public sentiment in England was, however, slow in responding to appeals for special education for the commercial classes. The example of Germany with her close connection between her growing industrial power and commercial success,

gave England a stimulus to adapt education to commercial requirements and in 1870 the Chamber of Commerce in London held a Conference. Again a second conference was held in 1885 and it must be said to the credit of the London Chamber and to its then Chairman, Sir Albert K. Rolit, that the example set by them was almost a model for such organisations.

The curriculum of the London Chamber of Commerce, Society of Arts, Institute of Bankers and such other bodies being only of a secondary grade and having regard to the fact how economic changes have been rapidly developing, it was considered necessary to equip business men with better education to meet modern conditions. A committee of the British Association was formed in 1894 and on their report the London School of Economics and Political Science was instituted for advanced economic studies, giving higher commercial education a prominent place.

The School worked on an independent basis from 1895 to 1900, but in that year it was admitted into the University creating "a Faculty of Economics and Political Science including commerce and industry." The regular courses in the School lead to the degrees of B. Sc. and D. Sc. This School offers highly specialized instruction in a wide range of subjects, and may be said to be the pioneer of institutions giving Commercial Education in Great Britain. The other Commercial Universities established in England are the Owen's College, which afterwards became the new University of Manchester, Yorkshire College at Leeds and the University of Birmingham. The curriculum of all these Universities are more or less framed on similar lines and the Faculty awards Bachelor of Commerce and Master of Commerce degrees.

It will be observed in wading through the different countries that the cry everywhere is "Education for Business" and how best this

education may be attained in Business Colleges, and it also goes to prove how necessary it is that a Commercial College should be established in many of the large Commercial centres.

There is a general notion that Commercial Education is nothing more than the bare teaching of Commercial subjects and that methods of commerce may even be gathered by undergoing an apprenticeship in the routine of office work. It may be that some men have been successful in business without much specialised training, but the characteristics of modern commerce being increased competition and increased complexity, it would be only men of exceptional ability and energy that would triumph over enormous difficulties. The two outstanding points of difference between the commerce of to-day and the commerce of fifty years ago being increased complexity and increased competition, the education of a business man should be such as to develop in him business powers and business knowledge. *Business power* is best developed just as other intellectual and moral qualities are developed, by a good general education in the School and the University, but the acquirement of *business knowledge* should be considered as specialised instruction. The so-called Business Schools and Commercial academies are not an aid to true Commercial Education; they may be aids to a certain extent so far as the training of junior clerks are concerned, but such education is merely elementary in its character. They are useful for counting-house clerks, bunks, railways and insurance clerks. But Commercial Education is not only for clerks; it is as much, or more, required for employers, heads of houses and departments, Agents and Travellers, and Captains of industries, especially those industries which involve the application of Science—the study of higher Commercial Subjects including (1) Economics—the Study of Economic conditions of Commerce (2) Commercial Law (3) The Commo-

dities of Commerce and their Geographical distribution (4) The machinery of commerce including such subjects as Commercial Practice, Theory and Practice of Accountancy and Company Administration and (5) The special subjects of particular businesses, such as banking, insurance, shipping, the sale of goods and railway administration. These Special Subjects have one common feature: they may be treated as the specialised equipment of the modern business man. They may be useful to every man whether he is going to business or not. Some of the above subjects may be learned in a course of lectures, others require years of patient study. Some should be learned out of books, for, practice and theory must go hand in hand.

In propounding a scheme of Higher Commercial training for the University of Madras, the curriculum should be wide enough to include all kinds of business knowledge which could be turned to our advantage. It should also be elastic to receive new subjects whenever occasion arises for introducing the same to meet the requirements of any special trade. Mr. G. A. Natesan deserves our thanks for bringing up for discussion the creation of a Faculty of Commerce in our University, and although the proposition was lost by 8 votes, yet it only indicates the opinion of a good number of Members present at the meeting. It is hoped that the subject will again be brought up at an early date and Mr. Natesan's labours will then prove successful. In the meantime it should be the duty of all those who are interested in the Commercial Education movement to discuss the courses of instruction and the method of organising the Faculty in Commercial Sciences. If the Madras University decide upon establishing degrees in Commerce like other degrees in the University, the study should cover a three year's course. The curriculum should be framed in such a manner as to suit the conditions not only of those directly

engaged in commerce, but also in other branches of commerce, such as those engaged in Banking, Insurance and Railway Companies. A young man in the University learns the theory and practice of the various subjects and when he gets into actual business life, he will bring to his work new ideas, new powers and new opportunities, in other words, he can acquire business knowledge after his term in the University and during the period of his actual business life. This should be the aim to be kept in view in framing a suitable programme of studies in Commercial Sciences. A faculty for modern commerce and trade should be many-sided; it should come in closest touch with the commercial and business life of the city in which it is created, and it must have in it a combination of commerce with culture, the highest sort of training by conferring degrees and diplomas in Technology and Commerce, as described above in many of the continental and British Universities.

If the University of Madras decide to create a Faculty in Commerce, I would make a practical suggestion, viz., that the Senate and the merchants, the bankers, the Insurance Companies, the railway companies and many other mercantile bodies of Madras should form a representative committee to consider the question of establishing the Faculty. The committee should suggest the curriculum so as to make it acceptable to all classes and conditions of business. This committee might itself or through a sub-committee be permanently associated with the Senate as an advisory board on commercial education.

The question to be thought out is what is the sort of education that would be required for the future man of business? It should not merely be technical, not merely literary, but must be a combination of both. The future business man should know the principles and usages of all branches of trade, buying and selling of different

commodities, mercantile agencies, shipping, railways, insurance companies, Banking and speculation. Commercial education will then satisfy commercial needs which can be ascertained only from a knowledge of the function of the mercantile classes. The curriculum of a faculty of commerce for our University should supply liberal courses of education specially adapted to the needs of persons who are, or who intend, to be engaged in any kind of administration. It should include various definite courses of study, say for instance, such as the following:—

(1) Economics and allied subjects:—

(a) History of Economics and Trade; (b) Political and Commercial Geography, (c) Study of Statistics

(2) Business Methods.—(a) Book-keeping and Accountancy (b) The machinery of Business, Banking, Insurance etc., (c) Study of commodities (d) Transport and means of Communication.

(3) Law—(a) Commercial and Industrial Law (b) Factory and other Legislation (c) Fiscal Legislation and Commercial Treaties etc.,

(4) A Study of Local industries. It is by the study of these subjects that the future business man will be able to grapple with important and serious problems connected with modern commerce. The education should be such as to enable him to grasp the mysteries of trade factors in the course of a short experience in business, say for instance, to gauge correctly the state of the daily market, glance over current prices, discuss the probable crops of wheat, cotton, sugar, jute, and such other various kinds of produce we generally export, weigh the chances of foreign competition and, from all these data, decide his own mercantile operations. The object of a properly organised Commercial College should, therefore, be to afford a systematic training in higher commercial subjects, in the study of Government and Public Administration and in the work of economic and social investigation.

This sketch on commercial Education is enough to show how far commercial Education can contribute to the development of a nation's commerce. The example of England, Germany, France, Austria and the United States can be cited as instances to prove that, through a good system of Commercial Education, they have developed their foreign commerce to a considerable extent within the past twenty-five years. Coming to the Eastern countries, Japan has, within the last twenty years, greatly extended her foreign trade by the foresight and wisdom shown by the department of education for diffusing commercial and technical Education. Not only that, the Department of Agriculture and Commerce is sending annually a number of students to different countries to learn various branches of trade and industry. I may point out here that if a good training in commercial and technical sciences can be considered as an important factor in the development of a nation's commerce, Japan's present expansion in trade may be cited as an example. The growth and development of the economic well-being of a nation cannot be ascribed to one or two causes only. In a society undergoing various changes and evolution, several causes contribute to produce the desired effect. It is beyond the scope of this article to enumerate and explain those various causes; but it must be said without hesitation that the trade and commerce of a country should be mentioned as one of those essential features to bring about that economic well-being for which we are all craving so much. It is on that account that so much stress is laid in recent years on improving the commercial educational systems and for establishing well-organised Commercial Colleges and Faculties for sound commercial training.

SOME FAMOUS INDIAN WOMEN

BY MRS. M. S. PINTO.

It is not possible for me within the compass of this short paper to do justice to my theme.

I must content myself with instancing a few of the Indian women who have won for themselves niches in the temple of fame. The exploits of some of these have been celebrated in ballads and their names have become household words in Indian homes. It is gratifying to our self-esteem to find that India has produced so many notable women in spite of the women of this country having been, except in ancient times, subjected to many restrictions. It is indeed surprising that more women have held the helm of the state or marched at the head of armies in India than in any other country. The women whom I shall refer to are those whose deeds have been preserved in history, but no doubt there have been innumerable women of equal or greater capacity who have exerted their influence in humbler walks of life and who have in their legitimate sphere of the home fashioned the characters and inspired the deeds of great men.

The first and foremost of famous Indian women is Sita who though she has become a legendary figure was probably a real character. Of wisely devotion there is no better exemplar than this good woman and I need not apologise for quoting somewhat fully her reply to Rama, her husband, when he besought her not to accompany him on his exile:—

"For the faithful woman follows where her wedded lord may lead,
In the banishment of Rama, Sita's exile is decreed.

... ..
Sire nor son nor loving brother rules the wedded woman's state,
With her lord she falls or rises, with her consort courts her fate.

As the shadow to the substance, to her lord his faithful wife,
And she parts not from her consort till she parts
with fleeting life.

...
Happier than in father's mansions in the woods will
bite fore,
Waste no thought on home or kindred nestling in
her husband's love.

...
And my heart in sweet communion shall my Rama's
wishes share,
And my wisely I shall lighten Rama's load of woe
and care."

I would next refer to the nameless heroine who during the fourth expedition of Mahomed of Ghazni in 1008 A. D., melted down their gold ornaments to finance Anungpal whose kingdom was attacked. Similar heroism was displayed by Padmini, the beautiful Queen of Chittore and the ladies of the noblest Rajput families in 1303 A. D., who, when Allauddin, the ruler of Delhi, attacked the fortress of the city, and when all further defence appeared hopeless, threw themselves like so many Lucretias on a funeral pile rather than suffer dishonour. This act of heroism was repeated by the women of Chittore when it was again attacked by Akbar in 1568 A. D.

One of the most remarkable of Indian women was Sultana Razia who reigned at Delhi from 1236 to 1239 A.D. She was an able administrator and appeared daily on the throne dressed as a sultan and with the accessibility of great Eastern monarchs, gave audience to everyone. Her end was however sad, for, her jealous nobles rose against her and having defeated her in two battles put her to death.

We have the reproduction of Boadicea in the beautiful Princess Durgawattie who, when her state of Gurra on the Nerbudda was invaded by the Moghuls in 1564 A.D., led her army in person against them till she was disabled by receiving a wound in her eye. Her army thereupon was repulsed and to avoid being captured by the invaders she seized the weapon of the driver of her elephant and stabbed herself.

Chand Sultana is the Joan of Arc of India. When the Moghuls invaded Ahmednagar in 1593 A.D., this state was divided into factions. She brought about a reconciliation of the factions who united and made a combined defence against the enemy. Like her French prototype, when she found that her army was giving way she took up the command herself appearing in full armour, sword in hand, a veil covering her face. She animated the flagging spirits of her troops and personally supervised the repairs of the walls. Tradition has it that when the shot was exhausted she made use of copper, next of silver, and then of gold, she ultimately loaded the guns with her own jewels, what a sacrifice this meant, we women can well appreciate. She succeeded in arranging a peace with the Moghuls which was advantageous in the circumstances. It is a sad commentary on the instability of governments in those troublous times that this Queen whose bravery has been a favourite theme of bards was put to death by her own subjects.

Of the type of Cleopatra was Nur Jehan—the light of the world—the beautiful woman who gained such ascendancy over her husband Emperor Jehangir that coins were issued on which both their names appeared. Her great fault was her ambition "the last infirmity of noble minds." The feebleness of her husband's character enabled her to exercise considerable influence on the administration of the Moghul Empire. But the influence was fortunately beneficial to the state and she displayed business like abilities of a high order. When her husband fell into the hands of his rebellious general Mohabat Khan in 1626 A.D., she disguised herself and joining the imperial army went to the Emperor's rescue mounted on an elephant. Armed with a bow and quivers she tried to infuse her own spirit in her soldiers. Her elephant was carried down the stream and was wounded; the elephant driver was killed and Nur Jehan was in imminent danger of death, when

her attendants rushed anxiously to the spot they found the Empress calmly engaged in extracting an arrow which had lodged itself in the body of her infant grandson whom she had on her lap. Having had to surrender herself she substituted strategy for valour and succeeded in defeating Mohabet Khan.

Famous not for anything she had done, but for the love she inspired in her husband Emperor Shah Jehan was Mumtaz Mahal whose remains are entombed in that dream of marble, the Taj Mahal "the pride of India and the admiration of the world."

It is refreshing to turn a while from the record of ambitious and bloody battles and dwell on the sweet character of the gentle Jahanara; this Princess when her father Emperor Shah Jehan was imprisoned by his son Aurangzeb, shared his imprisonment and looked after him lovingly. In accordance with her dying wish nothing but green grass covers her grave where one may read the touching epitaph:—

"Let no rich marble cover my grave,
The grass is sufficient covering
For the tomb of the poor in spirit
The humble, the transitory Jahanara."

Her dying wish was adhered to literally but not in spirit, for, her grass-covered grave is in the middle of a white marble tomb encircled by a beautiful lace-like lattice of the purest white marble.

A parallel to the burning of Moscow we find in the burning of the Palace of Bednore in the Western Ghats bordering South Canara. The Queen who was the ruler at the time of this principality hearing of the advance of Hyder Ali in 1763, and finding that she could not repulse him set fire to her palace and fled to the woods with a great many of her subjects.

The rise of Indore from a mere village to the capital of a flourishing state was due to the genius of Ahalya Bai. On the death of her husband she refused to accede to the request of her chiefs to

adopt a son and retire, but assumed the reins of Government herself which she held from 1766 to 1795 A. D. She was her own Chief Justice and personally dispensed justice. She gave public audiences without a veil. Of her, as of Queen Victoria, it could be said "her life was pure, her court serene."

One of the most pathetic episodes of Indian History is the story of the beautiful Rajput Princess Krishna Kumari, the Indian Helen of Troy. She was the daughter of the Rana of Udaipur, the most aristocratic of Rajput rulers. The contest for her hand among Rajput Princes led to bloody wars and intestine strife. Ultimately the Rana listened to the advice given him to put her to death to end the dissensions. She was offered a poisoned bowl by her sister Chand Bai and was asked to sacrifice her life for the honor of Udaipur. Meekly she drank the contents saying, "This is the marriage to which I was foredoomed" and her dying words were a prayer for the long life and prosperity of her unnatural father. She was in her sixteenth year at the time of her death which took place in 1810 A.D.

It may be surprising to the reader that in India, the land of the Purdah, there should have been two battalions of female warriors each one thousand strong. They not only acted as a body-guard of the ladies of the zenana of the Nizam of Hyderabad but also took part in the battle of Kurdla against the Mahrattas in 1795 A. D., when they were officered by Mama Raran and Mama Chandbibi.

The Pindaris were accompanied on their plundering excursions by their women mounted on small horses or camels; their bravery and ability deserved better outlets. Passing mention may be made of Tulsi Bai who sought to imitate Ahalya Bai. Her strength of mind and great ability were not however united with noble character. About her bravery there is no question. Mounted on an elephant with her adopted son on her

lap she led her army in one battle and displayed great courage. Not till her elephant became unmanageable on account of a wound did she quit the field. She died a violent death in 1817 A.D. on the eve of the Battle of Mahidpur.

The beautiful Bheema Bai, sister of the adopted son of Tulsī Bai, at the age of twenty commanded a party of 500 horse in the Battle of Mahidpur in 1817; she rode astride on a fine charger with a sword by her side and a lance in hand.

The state of Bhopal has been ruled by women from the year 1812 A.D. except for a short interval. In 1818 A.D. the Nawab died and his widow Secunder Begum assumed the reins of government and would not part with them in favour of her adopted son who was betrothed to her daughter. Though a Mussulman she held durbar without a veil. Her disregard of custom estranged her subjects from her and she at last had to hand over the government to her son-in-law. This prince died not long after. And his daughter who was then six years old ascended the throne. She took great delight in sports and was a good shot and a bold hunter. She proved herself to be another Ahalya Bai. She worked ten or twelve hours a day, visited every part of her state, attended to the drill and discipline of her army, placed the finances on a sound basis, introduced reforms in the judicial and civil establishments and organised a new Police force. The present Begum is also a remarkable woman. She has braved all the discomforts that foreign travel offers a Purdah lady and has crossed over to England to be present at the Coronation of our King. She is the first Indian reigning Princess to be present at the Coronation of a King in England. Her veiled figure was no doubt a noteworthy feature of the Coronation function.

I have reserved for my concluding remarks a sketch of Queen Mangammal of Madura whose

career will also appeal to the reader. This woman was the regent of Madura from 1689 to 1705 A.D. when that kingdom was passing through a great crisis. The Mahrattas, the Mysoreans and the Maravars of Ramnad made attacks on Madura during the reign of her husband Chokkanatha (1682-1689) who died of a broken heart. His son Virappa died in 1689. His child was proclaimed king and Mangammal became the regent. She secured for Madura immunity from foreign attacks. Though a staunch Hindu she treated other religions with respect and she took the part of Fr. Mello of the Society of Jesus when he was persecuted by the Setupati of Ramnad. Like the great Indian kings of old she constructed many useful public works. It may be said of her "*Si monumentum queris, circumspecto*" for, all over Madura and Tanjore there are choultries, tanks, roads and temples which are ascribed to her. Under her wise administration Madura flourished exceedingly. But the tenure of autocratic power has at all times been insecure, Mangammal was suspected rightly or wrongly of treason against the king and was imprisoned in the Tirumal Nayak's palace at Madura which stands to the present day. She was starved to death. She was cruelly tantalized by food being placed just beyond her reach which she could see and smell. What monsters her persecutors must have been! A great and good woman died the death of a felon.

KING GEORGES SPEECHES ON INDIAN AFFAIRS—Part I. A complete collection of all the speeches made by His Majesty during his tour in India as Prince of Wales. Part II. Full text of all the speeches delivered by His Majesty during the Coronation Durbar Tour. Price One Rupee. To subscribers, As. 12.

THE DEPRESSED CLASSES—A Symposium by His Highness the Gaikwar of Baroda, Mrs. Annie Besant, The Hon'ble Mr. Gokhale, and others. Price One Rupee. To Subscribers As. 12.

AGRICULTURAL DEVELOPMENT IN ENGLAND AND INDIA*;

BY C. E. LOW, ESQ., I. C. S., J. P., C. I. E.,

Director of Agriculture.

C. P. AND BEHAR, NAOPUR.

THE existing state of the economic and agricultural development of India presents a most interesting series of problems, even to those who are in no way personally or politically concerned with the guiding of the various movements that are going on in connection with it. There is one line of research, at any rate, that is probably more familiar to English than to Indian students of political economy, namely, a comparison of the present state of things in India with the corresponding conditions of village and town life in England, at a time when they were perhaps even less developed than they are in the India of to-day. It is in the hope that the possibilities of such a comparison may interest Indian students of their country's economic development, rather than with any serious intention of attempting to answer the question *Quo vadis*, that presses itself so insistently on all spectators of the industrial and agricultural career of the country during the last few years, that I have attempted to give the following brief and imperfect outlines.

I have a word of warning to add regarding the points to which attention should be directed. There are important differences, as well as important resemblances, and it may seem surprising to say, that the former are the less obvious and often the more important. To take a single instance, from the earliest years of its history, the rural districts of England have contained a very effective form of self-government; though the names of its officers might differ under different rulers and dynasties, Roman, Saxon or Norman, it has always been there, and has always, except during one or two brief periods of unusual disturbance, been able to secure safety of life and limb and security of property for the small farmer or artisan, as between himself and his fellows. Oppression by the great of the small is no more absent from the history of England than from that of any other country, but any system of autochthonous administration, outside the village unit, and not derived from the ruler of the

country, is what we do not find in India. To turn to another and less important point, I must state that the illustrations of parallels in India to similar phenomena in England are taken entirely from the only part of India with which I am personally acquainted, namely, the Central Provinces.

England in the early middle ages was an agricultural country to an extent even beyond what may be found in the India of to-day. At least five-sixths of the population lived in villages, and a very large proportion of those who lived in such towns as there were, held more or less agricultural land. Thus we find the townspeople of Coventry, one of the most important towns of the period, engaged in fierce disputes with the abbot of an adjoining monastery, regarding their respective rights to the arable and common land attached to the town. What trade there was, was mostly in luxuries required by the rich, and brought from abroad. Purple cloth, silk, spices, wine, gold and gems, and the like, not omitting the important article of common use, salt, were the principal objects of exchange. For other articles the village was self-sufficing. The stage of development in which the villagers are divided off into different industries, such as weavers, carpenters and the like, had only just been reached. Not many years before, every cultivator spun and wove the wool of his own sheep into a rough kind of garment. The village supplied itself with food from the produce of its own fields, wove its own cloth, lighted its own houses with candles made from the fat of its own animals, and the common people depended on the outside world for nothing except salt and iron, which they purchased from travelling merchants, who visited the large fairs, that were held all over the country at important centres, on religious festivals. This fact alone puts England far behind the India of a hundred or even two hundred years ago, in economic development, when it used to own a skilled caste of weavers, whose products were exported all over the world. The towns contained each its gild or association of traders. Most of them were merchants, there were not many pure artisans at that period. Those who did make goods also sold them, but as a rule only in response to a special order. These persons associated together for the mutual protection of their business. They all contributed to the common purse, the object of which was to pay the baron or lord of the town an annual fee for protecting or rather for not ill-treating them; it was also available to ransom of the gild who got into trouble when.

* Prepared for the last Indian Industrial Conference.

the town on business for religious ceremonies, and for assistance to the poorer brethren of the guild. I will now ask you to look at the state of affairs some two or three hundred years later, in the middle of the 14th century. We then find in the villages, separate weavers, carpenters, blacksmiths and the like. In the towns there are large collections of cutlers, leather workers, and above all weavers; for the weaving of wool was as important an industry as the weaving of cotton in India. The English weavers, however, did not learn fine weaving till a much later period.

The corporate life of municipal towns presented several very curious features. In addition to the guild merchant, or (later) the traders or *artisans'* guilds already described, there was the governing body of the corporation, that probably took its origin from the first named institution. All these bodies had for their chief concern, the encouragement of the trade and industry in the first place of their own guild and in the next of their own town, at the expense of any other person or body of persons whatever. As regards the first point, they took particular care to see that the members of their trade did not make bad wares, and did not work secretly, so as to defeat the attempts of the guild organisation to inspect the character of their work. Artisans and traders were only allowed to work or sell in certain fixed places. We have to go back a long way in Indian history before we find the guild so living and active a force as it was in medieval England. There were numerous ordinances for the keeping up of prices, the prevention of foreigners—a word which included all persons not members of the particular town—from sharing in the profits of retail trade, and the maintenance of a proper standard of quality. The medieval conception of price was something quite different from the modern idea of a figure fixed by supply and demand. The canon law in particular aimed at the idea of a just price, i. e., a price that gave the merchant or artisan a reasonable or living wage, and the burges or statesman was fully in sympathy with this idea. The canon law was a derivative from the Bible and the writings of the Fathers of the Church, common to the whole of Christendom, and concerning itself with matters which were considered fit for religious rather than for secular ordinance, among which at that time were the taking of interest, the making of wills, and the methods of trade, in their ethical aspect. The canon law was a real force, and embodied public opinion to an extent that may perhaps surprise a modern English reader, accustomed to resent intrusion of

the authority of the Church into the affairs of everyday life. But religion entered into such affairs far more than to-day. Usury was not only reprobated by the canon law, but loathed by the people at large. Its practice was confined to the Jews, and to members of nations whom, curiously enough, nearness to Rome had made more careless of its decrees.

To return to the medieval town, there was a strong sense of corporate life that has probably never been paralleled in an Indian town till recent years. Members of the different guilds were in the habit of making large donations of money or land, for the spiritual or temporal welfare of the guild, and at a later date, the leading burgeses loved to beautify their town with handsome buildings, or their rooms of meeting with splendid articles of plate. The establishment of magnificent churches recalls the temple building proclivities of pious rulers and merchants in India, but mixed up with the pious sentiment that prompted the English devotee, was a strong desire for the glorification of his native town or village.

Practically no English town has ever been established that does not owe its existence to its position as a trading centre. In all cases, they have been founded, not by kings, but by traders. London, the capital since the earliest times, was such simply owing to its excellent facilities as a port. The King lived in London, and made it the seat of his administration, because it was the largest and most convenient centre for his purpose. There is no parallel in English history to what was a very common event at the foundation of an Indian dynasty, namely, for the King to choose some convenient spot, and say to the people "let there be a city here." Such cities owed their very existence to the presence of the monarch's court, which drew to it and required for its support the concentrated wealth of all the host of small towns and villages throughout the realm. This was collected as land revenue and benefited the capital by being spent there by the king and his officers and favourites. In England, no doubt, many of the nobility lived in the large towns for a part of the year and spent a large proportion of their incomes there. But what made the town, was the natural flow of trade to it, attracted by the advantages of its position; and every nobleman, even the King himself, lived for a great part of the year in his own estates, and consumed the bulk of their produce locally. In the above facts are a number of striking and deep-lying points of difference between the fundamental characteristics of the two nations. An English village of this time

consisted of a row of huts, built of stone, rubble, wood, mud, or turf, and thatched with straw or turf, according to the nature of the country; these houses had no windows, and only a hole in the roof for a chimney. Each house had its enclosure, with grass and a few half-wild vegetables and fruit trees and with a byre, in which the cattle of the cultivator were kept at night. Surrounding these were the cultivated fields of the village. These were divided into three or four large divisions, called 'shots' very much like the divisions of the villages in most parts of India; and in the Central Provinces especially Chhattisgarh, where they are called *khars*. Now these were cultivated in what will seem, and no doubt really was, a most inconvenient fashion. Each cultivator held his land, not in one or two large fields, but in little strips scattered all over the village. A holder of 30 acres, which was as much as one plough could cultivate and was the usual size of a holding, possessed 60 half-acre strips, scattered over every part of the village lands. This is just what we find in Chhattisgarh at the present day, but as I shall explain owing to a different reason.

In the Chhattisgarh division of the Central Provinces, the people are suffering under precisely similar inconveniences, but the force of custom and the sense of individual ownership that has grown up under the years of British rule, are too much for the people, and changes are hard to make. A hundred years ago, the cultivator would have felt that he had no right to the particular piece of land he was holding, any more than to any other particular piece of land; what he had a right to was a certain amount of the village lands to cultivate, and so long as he had that, he had no just cause of complaint. This fact was recognised by the periodical redistributions that took place at intervals, and were called *lakhabata*. There is, I believe, no real trace anywhere in India of the joint ploughing that underlies the English village system that I have been describing; whether this was due to the light and easily tilled nature of the Indian soil, which has always been easily ploughed by a single pair of small oxen, I am not aware.

Now the English cultivators did not hold land in this way, because, at the time of which we are speaking, it was the most convenient, but because it had been at one time necessary, and they were unable to change it. This kind of cultivation arose from the fact that the cultivators in still earlier times, used to club together to plough and sow. One man would find an ox, one the wood for the plough, another having nothing to contri-

bute would work as ploughman. In the Venedotian code, which was the law in force in early times in South Wales, it is laid down exactly in what way the land shall be divided up among the people who have found the animals and plough equipment. The ploughman took the first furrow as his own and sowed seed in it, the man who found the plough ironed the next, the man who found the land side or the next, and so on; there were usually eight oxen in a team, and it is rather startling to hear that the man who drove them walked in front with his face towards them, and the plough was fastened to their tails. A length of 220 yards is called in English a furlong, which means a furrowlong. A piece of land one furlong long, and one rod broad is a rood, and four of these roods make an acre. If you look at the map of an old English village, you will see that most of these strips are each just about a furlong in length. Every man was naturally to have a right of way to his separate plot, and you can imagine what an enormous number of paths there must have been, and what a splendid opportunity for disputes lay open to a quarrelsome man.

The crops were sown according to the old three field system, of *tith*, *etch* and *fallow*. *Tith* crops were sown after fallow, and usually consisted of wheat and rye, sown in autumn. The *etch* crop, *etch* meaning stubble, was usually but not always sown in the spring, after ploughing up the wheat stubble which was first grazed over by sheep, cattle or poultry. It usually consisted of barley, oats, peas or beans. Wheat was the staple food of the better parts of the country, mixed in places with rye, and in the northern and western tracts, which were more backward, the principal food was oats or rye. Generally the standard of living was higher in England than in other European countries, but the country was specially liable to famine; '*Anglorum franes*,' or 'the famine of England' was mentioned by a medieval European writer as the curse of the country. The only reason that is ascribed for this, was the fact that the people were accustomed to live well and extravagantly, and alternated between seasons of extreme plenty and cheapness, with times when prices were 9 or 10 times higher than ordinarily.

It is quite clear that it was impossible to improve the breed of cattle with such a system of agriculture. No fatter crops could be grown, as long as fields were all grazed over directly after the harvest. The people moreover did not know of the advantages of such crops till many years later, and were therefore unable to feed their

animals in the winter. The animals, wandering all over the village, dropped their manure here and there, so that cultivators had very little benefit from the dung of their own cattle, though there were instances of herding animals in a field at night for manuring. Moreover, owing to all the cattle of the village, good and bad, roaming together, it was impossible to keep a good breed distinct, and infectious disease was readily communicated. Nowadays, in England, every cultivator keeps his own cattle in his own enclosed field. One of the most important thing that the Agricultural Department has before it is to improve the cattle, and these same difficulties confront us now in India, especially in Chhattisgarh, with the added one that the Indian cultivators burn their cowdung for fuel, which was not a general practice in England, where there was generally plenty of wood. When in the 16th and 17th centuries enclosures of fields and fodder crops came in, it was possible to stallfeed animals during the winter; they increased in size and number, gave more manure, which in its turn made the field more productive. Oxen were generally used for ploughing in the middle ages, though horses were more usually employed for pulling carts and carrying pack loads, in which most kinds of merchandise were taken about. Gradually the horse displaced the ox, until now there are only a few places in England where plough oxen are to be seen, and even there their use is by no means general.

Now, who were the cultivators of these lands I have been describing? In the first place, was the lord of the manor. He might have only one manor, or he might have several hundreds. A writer on household management in the 13th century advises large landowners to have a clear account of what food was to be found in stock at each of their manors, and to arrange to stay at them one after another, so as to eat up all the supplies, without waste. These supplies came from the home farm of the landlord, and from the tenants. The home-farm was cultivated mostly by the serfs and tenants, with a few hired servants of the lord under the supervision of his reeve or bailiff. There were three classes of servile tenants. The villeins or yardlings, who were by far the most numerous class, held an area which corresponded to what a pair of oxen could cultivate, or about thirty acres. This area was called a yardland. There were also so called 'half-villeins' who had only one ox, and held about 13 acres. The next class was that of the cottars, who had no cattle, and had only their cottage and its enclosure of about 5 acres, which presumably

they cultivated by manual labour or by hiring cattle from some one else. There is a class of cultivators in most Central Provinces districts, who have no cattle, and who pay for the cattle they hire from others by working so many days in return or in some other way. The lot of these men is a hard one, and I do not think that the lot of the medieval cottar was very much better. But it was better than that of the lowest class of serfs or slaves. Here is what a writer of the eleventh century says of one of them. "Be it never so stark winter, I dare not linger at home for awe of my lord. I have a boy driving the oxen with a good iron, who is hoarse with cold and shouting. Mighty hard work it is, for I am not free." Now the tenants, both cottars and villeins, had to do certain work for the lord or as it is called in most districts in the Central provinces *begar*. The villeins at ploughing time had to plough for two or three days in the week the manorial land, usually clubbing their cattle together to make up a team. They had to find a certain amount of seed for the lord's land. Then they could also be called on at other times for work for a certain number of days. They had also to make payments in money. Thus, a manor in Huntingdonshire has on record that the villeins had to give 10 bushels of oats at Martinmas as fodder corn, 20 eggs at Easter, 10 eggs on St. Botolph's day, and also to pay something towards making the milldam and digging the vineyard. The daughters of the villeins could not marry, without a fine being paid by their fathers, who had to escort their landlord in his journeys up to a certain distance, and to carry his wool and corn to market, with their own animals. Almost every manor had its cornmill, and all the tenants had to take their corn to be ground at that mill, and nowhere else. The landlord naturally got a good rent for the mill if he leased it out. The tenants also had to go with the landlord when he went hunting, and drive the animals. Sometimes they had to keep his dogs for him. The cottars had to do similar services, only, as they had no cattle, they had to do more personal work.

In return for this, the tenant got, besides the right to cultivate his share of the village lands, the right to take wood from the manorial forest, when there was any, and to graze his cattle over the whole village lands, after the crops had been cut. He was not allowed to graze all the cattle he liked—only a fixed number. There were certain meadows that were temporarily enclosed, and cut for hay, but most of the grass land was only grazing land.

holding is a great drawback to good cultivation, but when we try, as Government did a few years ago, to get him to exchange fields with his fellow-tenants, so as to bring his holding into a compact whole, we find that his distrust and conservatism are too strong to overcome, and so we should have found, I doubt nothing, in the case of the English manorial tenant of 600 years ago. How then did the change come about? The main cause was the awful calamity of the Black Death, or as we call it now, plague, that swept over the whole of Europe in 1349. The visitations of plague in India, dreadful as they are, are in no way parallel with that terrible calamity, that reduced the population of England by one-half in the course of fifteen months. The ordinary death-rate, as seen in the record of the appointment of parish priests, was increased about 12 or 15 fold. The living did not suffice to bury the dead. The fields went out of cultivation, the harvests rotted on the ground, and the grass grew in the village streets. With this enormous loss of population, landlords could find no tenants to till their land, and labourers were not to be had, except at wages double or more than double of what they were paid before. The price of corn stayed as low as it was before or nearly so, and gradually farmers found that it no longer paid them to grow so much corn. The landlords had to take the land into their own cultivation to a large extent, and, as they had not the labour to cultivate it, they were also inclined to lay it down as grazing area and keep sheep there. These causes gradually operated, till, after some 300 years had passed, a very large proportion of these scattered strips of cultivated land had been thrown into sheep walks. Many men kept as many as 20,000 sheep. Instead of recognising that the country was adapting itself to the circumstance of a lessened population, Government tried to restrict the number of sheep that might be kept, but as usual in vain. At a later date, an English writer says, that the sheep, though so gentle and innocent a creature, was really worse than a lion or a tiger, because, instead of only men, it ate up houses and farms as well, meaning that sheep farming had been the cause of the decline in arable farming and rural population.

The most important product of the English farmer for many centuries was wool; and much attention was paid to this by the Government, as the export tax on wool, which was for many centuries nearly all sent abroad to Holland or to Italy to be woven, was the most important cash revenue of the Crown. It was also the constant policy of King Edward III to do all he could to improve

the breed of sheep, and to get the manufacture of cloth taken up in England. The principal weaving centres of England were in the eastern and western countries, where it was practised in large villages and small towns; and it was not till a later date that the weaving communities of Lancashire and Yorkshire arose. The former, as everyone knows, have taken up cotton weaving, but the latter have still retained the art of cloth weaving, though now it is carried on in factories. During the middle ages, England was the most backward of western countries, not only in respect of manufactures but even of trade. It was the result of the policy of her kings, that the wool trade laid the foundations of her present industrial position. The powerful weapon of protection was employed, first to raise the price of the new product, and next to prohibit its export, and thereby build up a trade in cloth. As I have said, at one time the wool of England was all worked up on the looms of Florence and the Netherlands. Foreign weavers were invited to England, at first to the great disgust of the local weavers and cloth merchants, to weave the finer and more elaborate materials, and the outcome of this was the skilled weaving communities of the eastern, western and northern countries. A not inapt parallel may be found between the wool trade of England, built up on a local staple and by the example of foreign weavers and the cotton trade of the west of India, which has now passed largely from the hands of its European founders, into those of Indian capitalists. Whether a corresponding line of protective policy would have equally beneficial results under modern conditions, is a question on which I am not prepared to enter. By the reign of Elizabeth, we find the state of affairs in rural England to be as follows. Over most parts of the country farming was carried on in the old open field system, but there were also very large areas held as sheep farms. The style of farming was also improving. We had also learned from the Dutch to grow fodder crops, and the farm animals, instead of starving half the year on frozen grass, were now well fed all the year round. They produced more manure, and that gave better crops. Where the farmer was no longer tied down to farming by scattered strips, he was able to utilise the knowledge of improved methods that had come into the country. But in the midst of this comparative prosperity, there was one fearful blot. The cultivators and labourers who had managed to make a living on the land with the help of common rights that gave them a little grazing for

their cattle, were in bad case, when the landlords put the cultivated lands into grazing, and enclosed the commons. The landlord felt no further obligation to keep them, since they had challenged his right to make them work at low customary wages, and wandered off to other villages to get as high wages as they could. The roads were therefore full of 'valiant beggars', as the laws of that time called them, who were a menace to the community. Pauper legislation began to be enacted, which was previously as unknown as it is in India of to-day. Any person found begging was to be whipped and sent on to his parish, which was bound either to find work for him, or to maintain him, and taxation was imposed for that purpose. This was an unpopular measure and the landlords of a parish did their best to avoid it, by pulling down the cottages where the poor people lived, so that there should be as few as possible to become chargeable to the parish rates. The unfortunate labourers had to live where they could and most of them were unable to find cottages near where they had to work, which meant that they had to rise an hour or two earlier, and walk in the cold and darkness of a rainy winter morning to their work. This and the poor food that their miserable wages provided for them had a bad effect on their health, and when we remember the fact that plague was still a regular visitant every few years, that small-pox had now become a very serious cause of mortality and that malaria and fevers caused by insanitary dwellings were rife, it is not to be wondered at that the expectation of life in those days was very much lower than it is now, and that men were then as old at 50 as they are now at 70.

To these miseries of the poor, there was added yet another, the decline in wages. After the Black Death, there was a period during which the labouring classes were more prosperous than they ever were, before or since. There was little or no rise in the price of food, and their wages had doubled. You have only to look at the effect of plague in the Punjab of to-day, and you will see a somewhat similar state of things. Here, however, as in the rest of India, a rise in prices is setting in, and it is probably due to the same cause as that which shortly after began to operate in medieval England. Owing to the discovery of America, and the enormously increased production of the precious metals, the price of all articles of food and ordinary use began to rise to an unparalleled extent. Seasonal fluctuations there had been, but this rise in the price of food had come to stay. So it

seems that to-day the increased output of gold in South Africa has a good deal to do with the rise in prices that has affected the world. There was in England another cause that is happily absent in India, namely, the debasement of the coinage, that was begun by Henry VIII and was continued by his son. In the face of these happenings, it is well to consider what is likely to be the outcome of the present rise of prices. It is fortunate that the rise in wages has in India occurred almost simultaneously with that of prices, but if the latter outruns the former, we may be threatened with the same terrible pauperism as England had to face in the sixteenth century.

We now turn to the towns. Here we find that industries had become more specialised and centralised. There had arisen a class of merchant adventurers, to whom England owes her overseas Empire of to-day, who traded across seas in their own ships. There were also merchants of woollen cloth, of leather, of iron ware and the like, who purchased their wares from the artisans who made them. This meant that capital was increasing, and that the money earned by trade or manufacture was accumulating, while it was being used to forward still more the very industries that had produced it. Finally, the Government of the towns was no longer in the hands of the various guilds, but of properly empowered and regularly constituted municipalities, who had grown out of these trade guilds. But even yet the artisan employment available in the towns was not enough to absorb the displaced labour of the country. That was reserved for a still later stage, with a description of which I will bring this paper to a close. The process of the substitution of compact farms of a large size for small scattered holdings went on slowly till about the beginning of the 18th century, when arable farming became so profitable that the sheep grazing began to decline. This was the signal for the final acts of enclosure, that took place between about 1740 and 1830 and completed what the 16th century had begun. Instead of the open treeless fields divided into their narrow strips, with a close packed cluster of huts gathered round the parish church and manor house, you will find in England to-day a country of large fields, separated by hedges, with farms and cottages scattered all over the whole country, and not confined to the village site. *Pukka* roads lead to every village, indeed, in most cases, to every farmhouse or group of cottages. But the great and most important change was in the towns. In

quick succession were invented the arts of smelting iron with coal, of spinning and weaving by machinery, of calico printing and of porcelain and ornamented pottery making. The power mill, worked by wind or water, was introduced in the 17th century, while the steam pump, followed by the steam engine, came in during the next century. The result was an enormous demand for unskilled or semi skilled labour; but, owing to the fact that labour had not yet organised itself for its own protection, and that the prevailing sentiment of the time favoured a policy of allowing employers and labourers to settle the rates and conditions of wages by mutual agreement, this increase of factory employment was accompanied by a great deal of misery, and, though labour has now won a partial recognition of its rights, the struggle has left a legacy of class hatred which had never been known before in England, and is at the bottom of the active socialistic tendencies of to-day.

I do not know if any deductions may be drawn from these facts, but there are one or two that I would like to suggest. One is, that all nations have to pass through more or less the same processes of evolution, and England of 600 years ago was very like, allowing for differences of climate and national character, the India of to-day. Another is, that there is not much difference in the happiness of a nation at the different periods of its growth. A nation gains in power by progress in economic development, but its individuals are not as a whole the better off or the happier. Though the labourer of the middle ages ran the risk of having his wife or daughter taken away by an oppressive lord, or of being made to work long hours for no pay, or of being thrown into prison without cause, he was in little or no danger of starving, so long as he stuck to his village, and the wages he earned sufficed to purchase him a larger share of the necessities of life than has been the case with the labouring class in any succeeding century. He also found it far easier to obtain a piece of land and become a member of the farming class. Security of life and legal rights have been purchased at the cost of security of livelihood. Let us apply the parallel to the case of this country. India stands economically at the parting of the ways. That it will ever become exclusively or mainly a manufacturing country, I do not believe, but there is no possible doubt that a large enough portion of its population will at no distant date come to depend on industrial resources. And when this comes to pass, we must not imagine for one moment that the

country will have reached a haven of security. It will have exchanged one set of difficulties for far graver ones. Pauperism in India, which is bound to be the result of a large population entirely divorced from all connection with the land, and drawing their livelihood, from the fluctuating demands of trade, will be a vastly more difficult problem even than in England, where we have hardly as yet begun to solve it. But are we therefore to recoil from the path of progress on which our feet have been set, ever since the world was created, and living beings were placed therein? We cannot, even if we would, and no man is worthy of the name of such, that would if he could. But we can draw a sober confidence from the history of others that have trod the path before us, and advance, without fear, with hope of the ultimate future, and with the full trust and belief that the Power that made this world and all that is in it, is fulfilling its own purpose in ourselves, for the benefit of the whole created universe.

AGRICULTURAL INDUSTRIES IN INDIA

BY MR. SEEDICK R. RAYANI

WITH AN INTRODUCTION BY

SIR VITALDHAS DAMODAR THACKERSEY

Contents :—Agriculture; Rice; Wheat; Cotton; Sugar-Cane; Jute; Oilseeds; Arecia; Wattle Parks; Sunn Hemp; Camphor; Lemon Grass Oil; Ramie; Rubber; Minor Products; Potatoes; Fruit Trade; Lac Industry; Tea and Coffee; Tobacco; Manufacture Subsidiary Industries; Sericulture; Apiculture; Floriculture; Cattle-Rearing; Dairy Industry; Poultry Raising; An Appeal.

Sir Vithaldas Thackersey writes :—

Mr. B. R. Rayani, I think, has given valuable information regarding the present state and future possibilities of the principal cultivated crops of India.

Rs. 1. To Subscribers of the "Indian Review," As. 12.

Mr. W. H. SHARP, DIRECTOR OF PUBLIC INSTRUCTION, Bombay. "Agricultural Industries in India" by Seedick R. Rayani, price Rupees One, and published by G. A. Natesan & Co., Esplanade, Madras, is recommended as a book suitable for the Libraries of Secondary Schools in this Presidency.

II. E. THE GOVERNMENT OF BOMBAY hopes that it may have a wide circulation and stimulate the introduction of the improvements which are so necessary if India is to reach its full economic development as a producing country.

G. A. Natesan & Co., Sunkum Chetty Street, Madras.

Are the Eurasians a Depressed Class ?

BY

MR. A. P. SMITH.

IN my last article on this subject, which appeared in the September number of the *Indian Review* I brought up the discussion of the question given in the heading to the subject of associations. There are now several of these associations in India and Burma, and only very recently has the idea of amalgamation and united effort been recognised as one of the factors of success—whatever that success may be. The reason why these associations—and I refer more particularly to the Madras association—have not got any “forrader” in being thoroughly representative, is, that there is no precise definition of what a Eurasian is. That is to say, is every man who bears a European name and is dressed in European fashion a Eurasian? The reply will be that only British born subjects are Europeans; that is to say, only that person who can prove that one of his grand parents, paternal or maternal was, or is, a pure European is admitted as an associate. This rule is good enough so far as it goes, and only of late years has any scrutiny been made regarding a Eurasian's claims to become a member. Negligence in enforcing this rule does still prevent many Eurasians from joining the association, and on the other hand it is to be borne in mind that even the rigid observance of the rule militates against many persons joining the association; for the reason that though a European British subject may be an associate, by reason of his marriage contracted with an Indian or one who is not a British born subject, the offspring of the associate are not eligible as members of the association. If therefore A who is allowed to become an associate, because his grand-father was a European, married B, an Indian or a Eurasian who is not a European British subject, his children in the fourth generation are manifestly not European British subjects, and he very rightly

refrains from joining an association which will in no way benefit his children. What then is the remedy? I have given considerable thought to the matter and the only way to do it is to *eliminate the Eurasians*. Let me not be misunderstood. The Anglo-Indian Association of India and Burma—for there must be only one association to be effective—according to the rules in force is solely for Anglo-Indians; in other words, European British subjects domiciled in the country—and it follows that Eurasians—not European British subjects—are not Anglo-Indian, from the point of view of the association. This process of selection will exclude a very large community who are popularly classed as Anglo-Indian and Eurasian, but who, to the Anglo-Indian associate of India and Burma, are nothing more or less than Indian with whose present and future, the association does not concern itself. They can sink or swim and battle for themselves irrespective of any help or countenance of the association. That is just what I mean by the expression ‘*eliminate the Eurasian*.’ All that the Anglo-Indian Association can do is to prevent the intrusion of Eurasians—who are not European British subjects—into the ranks of the association. Having once got a community of Anglo-Indian British subjects as associates, it becomes the primary duty of the associations to do a little grand motherly work in making it compulsory on its members to form marital relations only with British born subjects—any dereliction in this respect entailing expulsion from the ranks of the association. The association should also bring pressure to bear on large employers of labour and the Government to discountenance in every possible way, illicit connections of their European servants with Indian women. If an Anglo-Indian British born subject prefer to marry an Indian there can be no possible objection, and he will do so fully aware of the disabilities that his children are likely to face in future life. What the association should

resolutely set its face against, and use every means in its power to discourage and condemn, is the illicit relationship of European British subjects with Indians and the consequent perpetuation of Eurasian offspring—and the Eurasian problem—as it has been called. If this antagonistic position to the production of Eurasians is steadfastly maintained for sometime, I do say that it will result in diminishing very considerably the illicit Eurasian birthrate. The exclusive spirit fostered by the Anglo-Indian association in the manner described would in a few years eliminate the coloured element altogether and give the association a *locus standi* which would make it a really representative body. That Eurasians—that it is to say, the product of the marital or illicit relationship between Europeans and Indians, or among Eurasians,—will disappear in the near, or distant future as a community struggling to keep its head above water as a distinct community, there is no probability. The lot of such a community will always be a pitiful one, and there is no help for it. Some few will rise and the majority will sink to the level of the maternal ancestry. Facts are stubborn things, and must be faced. The Anglo Indian association cannot accomplish the impossible task of perpetually playing a fairy godmother to succeeding generations of a community which is the result of a continuous causation of undesirable relationships. All it can do is to stand up for the desirable object, to discourage a manifest evil and to become a real power in the best interests of the domiciled community in this land of various communities. The sooner the Eurasian—and according to the new nomenclature, 'Anglo-Indian'—which the Government has adopted—recognises that he is an Indian and that to succeed he must adapt himself to his environment and throw in his lot with the people of which he is a component part, the sooner he will learn to stand on his feet and less

will be heard of what has been called the Eurasian problem.

As regards the question at the head of this paper. In my first article I have said that the Eurasian *per se* if no better, is certainly no worse, than his neighbour and that compared with European peoples his position in life is in many respects superior. Handicapped at the very beginning with illegitimate parentage and deprived of all responsible care in his up-bringing it is a marvel indeed that he has made any headway at all. The better kind of Eurasian will in spite of prejudice find his way to the top and become merged in the better class of European, and the never-do-well and the ignorant will inevitably become part and parcel of the Indian working population. The best way to deal with the inefficient Eurasian is, as I have said, as far as possible to eliminate him.

ODE TO INDIA

BY

MR. JOGESH MISROW,

(University of Washington).

My loving Ind,—thou a paradise fair
Where flow milk and honey, blows Malayan air
Where, where Nature's bosom decks
The gurgling Ganges or Kailash lakes?
Where are Sams, Sandal, Jasmine bower—
And Lotus blossoms as Buddha's flower?
The Syama's whistle, the Pappa's song,
The spring-guest Cuckoo's cooing long,
Dance of Doyal, Mayoor gay
And nectar strain of Boal-bool's lay—
Her temples, chants of Vedic lore
Hail her children on far off shores!
Holiest of lands—cradle of Aryan race
Awake ere dawn brighten thy face.

MODES OR RAGAS OF HINDU MUSIC.

BY MR. C. GANGADHAR.

 F late much interest is being shown towards the music of this land not only by the people of this country but also by Europeans and Americans. The English-knowing devotees of the art have at last found out the causes of its decay and are taking practical measures to redeem it from the dire fate of oblivion. Endeavours are being made to translate into English many a valuable book on Music such as "Raga Vibhedha," "Bharat" and other standard works in Sanskrit, which were hitherto only "sealed books" to many of the lovers of the art. A music journal is being started with a view to serve as a medium for interchange of ideas and for bringing to light ancient works on music of great value. These are really "hopeful signs" as H. E. Sir George Clarke, the Governor of Bombay puts it. This is not all. An English admirer of our music is stated to have written "that German and French musical scientists are now very interested with Hindu music" and another equally sympathetic and impartial lover is stated to have expressed "that Hindu music needs studying and that there are many things in it which Westerners can make use of in their own music and that it is one of the most wonderful systems of melody ever produced." These are highly complimentary indeed.

The above is only the theoretical aspect on the subject. The practical work done is still more gratifying. Miss Maud Mac Carthy, an accomplished Irish musician made a special study of Indian music sometime past and is now making her best efforts to restore it to the high ideals of its past by singing Indian songs and lecturing upon them on the concert platforms in London. When singing she wears, it is stated, a beautiful dress of an Indian lady in token of her high appreciation of

our music. One Mr. Khan, a talented musician of the Baroda State is stated to have left Bombay to represent Indian music in the Western Hemisphere, though we have not yet heard of his progress since then. It is high time that many of our state musicians should go abroad so that our music may be well represented. Such a step will surely impress upon the minds of other nations the high value of our music, besides luring several devotees from other parts of the world.

Lastly, we have to note with pride the extraordinary work done by Miss Satyabala Devi in America in the cause of our music. Her illustrated lectures on Music before crowded meetings of the leading musicians of America, accompanied by music on her favourite Vina, really prove her great talents. In her bold lectures, she was able to convince the American musicians of the superiority of the Hindu Music to all the rest, by touching many an interesting point connected with it. She emphatically declared that our music is not a music to be got up by sight and that though all our songs from the most classical styles to the commonest description of popular reels and jigs may be rendered into staff notation if suitable improvements are made over the present system, it will be extremely difficult, nay even impossible, to render the Indian Modes or Ragas to notation. I quote her own words:—

A considerable difficulty is found in setting to musical notation the Ragas and Ragnis of Hindustan, as our system does not supply notes or signs, sufficiently expressive of the almost imperceptible elevations and depressions of the voice in these melodies, of which the timing is most difficult and the modulations frequent and very wild. Even European professors of music here in America tried to set to notation Ragas Malar, as is played by me on Vina, and they give up the attempt in despair. Why? Because you can put letters to notation, but you can never put expressions and life to notation.

How truthful is her last statement and what beauty is bidden therein! The practical men will realise it. It is a pity, however, that the Editor of the *Indian Music Journal* should differ from her views. He maintains that:

If European professors have tried and failed to set to notation Ragas Malar or Asaveri, it must be that they did not fully comprehend the technicalities and the peculiarities that are characteristic of the native art, but not to the inherent difficulty of the Raga. Is it possible to imagine that the European who has invented a machine which could even in the absence of the musician, imitate his voice, tone, his style and what not to a most satisfactory degree, could not write a particular piece on paper with a far greater number of facilities?

Our friend has forgotten that it is not a question of setting a piece of music into notation, but setting Ragas or Modes into notation. Ragas which form the best and the most important portion of the Hindu music may be compared to a big ocean, boundless and unlimited. History tells us that great musicians of the past handled a single Raga for days together before ending it. Can Ragas be called then a piece of Music? If the boundless ocean can be measured by any measuring instrument with any number of mechanical aids, however ingeniously invented, then Ragas can be rendered into staff notation. One can satisfy oneself by measuring a barrel of sea water with quarts and pints. Even so a bit of Raga may be imperfectly converted into staff notation for one's own satisfaction.

Indeed our Western scientists who have invented a machine which can reproduce any music, however difficult it may be, may even invent another machine which can reproduce music that is merely in the form of a thought passing in the mind of a musician though he has not actually given articulation to the music sound through his voice!

I need not dwell long to impress the practical difficulty inherent in rendering Ragas into staff notation. It has been well expressed by the late Mr. Chinnasawmy Moodaliar, M A, in his valuable treatise entitled "Oriental Music." The world could not have seen a more enthusiastic lover and devotee to music than he. I quote his words:

It is not always possible to express in written language every idea springing in the human brain, in a manner sufficiently clear to all; nor can any written language reproduce the thousand variations met within the

articulation of the same sounds or the pronunciation of the same alphabetical characters,—much less can it convey the peculiar impressions produced by gestures and other graces employed by effective public speakers. It is so with music of every description and of every country. None but musicians who have made the attempt can fully realise the difficulties inherent in the task of clothing in any written language those intricate fluctuations and indescribable flexibilities of the human voice or those lofty flights and sublime aspirations of the human soul, which can be expressed only by the mighty song of the choirs of Cherubim and Seraphim above, and which no living creatures on earth save the denizens of the highest regions of the air are empowered to imitate. No notation however complete can fully or accurately delineate those magnificent fore-shadowings of eternal beatitude which fill the imagination of the composer in those happy moments of his highest inspiration, not a millionth part of what he then feels and thinks can be put down mechanically on paper; but when this has been done, the interpretation given of this skeleton by even the most intelligent and skilful artist necessarily differs from the rough outlines sketched out by the author, how wildly it must diverge from his original ideal need hardly be mentioned.

These difficulties are far more insurmountable in the case of Oriental Music, than in any other, because every Melakarta and Raga to which the melodies belong, possesses a distinctive physiognomy of its own which defies depiction and almost every note in these characteristic styles is accompanied by a peculiar flourish of graces and embellishments and subtle sound-complications of diverse kinds.

The simplest succession of notes in the gamut of each mode is rendered ornamental by delicate combinations with higher or lower notes appertaining to the particular ascending and descending scales in that mode.

To reduce all this to notation and thus give a local habitation and a name to what may be described as floating in the air, or rather as floating with the wind has been a labour of love to many a persevering devotee of the indigenous art, but, although the attempts made in this direction have undoubtedly contributed to minimise existing difficulties, it is to be regretted that very little justice has yet been done to the art itself.

It has also been expressed by him "that even the clearest and most expressive of all existing symbols used in musical language, cannot reproduce with absolute precision the extremely subtle ideas of a musician's brain or the deep pathetic emotions of his heart."

Let us also see what Miss MacCarthy's views are on the subject.

She believes that although it is possible to accurately record some musical performances for purposes of preservation and study, the chief feature of Indian Music, namely, its systematized improvisation, can never be preserved in writing, and thus, its unique heritage, is what most European influences, including the ordinary notation, tend to destroy. Therefore the construction of a special notation is only one means—a comparatively small one, in the work of preserving the ideal in

Indian Music. That ideal is, in her opinion, the complete surrender of the artist to the beneficent powers which must flow through him to his hearers when music of this high type is properly interpreted.

One more remark and I conclude this article. Ragas which connote pathos and feelings are not expressed in any spoken language when sung or played, but only in the mute language of Music.

The execution of any song is definite and is said to be completed if the Sahithya therein expressed is fully uttered in its several modulations called "Sangathi," whereas the execution of a Raga is indefinite and unlimited.

Though each Raga has to be played in strict conformity with the scale prescribed for it, yet full liberty is given to the musician for the ways in which it should be handled. This would depend upon his vast knowledge in music combined with his fertile imaginative powers, more technically called the *Manodharma*.

This *Manodharma* cannot be said to be uniform and hence the same Raga, say *Bairavi*, sung by X will certainly differ from *Bairavi* sung by Y or Z. And again, the same *Bairavi* sung by X himself at one time will differ if sung by him at another time, as his *Manodharma* cannot be expected to be the same at all times. So far regarding the difference in style of execution. About the time-limit, no one can say how long a musician will sing a Raga which flows from his mind as it were from a spring. This will also depend upon his *Manodharma* at the time when he takes up a Raga. Which then are we to fix as *Bairavi* Raga proper? Is that the one sung by X, Y, or Z or that sung by X himself in the morning or evening, mid-day or midnight, or again the *Bairavi* Raga sung for five minutes, hours or days by X, Y, or Z though varying from each other, yet one is as good as the other? Which then is to be fixed as *Bairavi* Raga proper and reduced to staff notation? Not practicable.

THE TRIUMPH OF PASSIVE RESISTANCE.

BY

MR. P. K. NAIDOO.

SINCE my return from India it has been my desire to lay before the public in the homeland how we fought and won our battle in the Transvaal, with the novel weapon of Passive Resistance.

May I observe here that it is to be hoped that this hitherto untried weapon of political warfare, may hereafter at all times be embraced as the only ultimate means of adjusting differences between contending factions?

This means of battling for civic rights is one which cannot be profitably undertaken on the spur of the moment. Passive Resistance calls for a preparation as complete and perfect as is demanded from any warrior in the world of physical force. The chief weapons of the would-be Passive Resister are humility, patience, boundless courage, and an unbending determination with the accompanying appreciation for the principles involved, and an unlimited capacity for accepting physical pain and suffering in the vindication of the same. Then indeed, "walls do not a prison make, nor iron bars a cage." The reader will fail to appreciate the sentiments expressed in this article, if he is deprived of even a small insight into the picture of the Passive Resister at work on the battlefield. I will therefore beg your permission to introduce the reader to a distant scene of the actual warfare. The mettle of the Indian nation was tested in South Africa and that properly in the Transvaal. Of this test, I can only permit myself a very brief sketch. Behold there the men at work. They are wielding the pick axe, the spade and the hoe. The morning is a bitterly cold one, the men are scantily clad, the piercing winds cut through the exposed parts of their bodies as if with sharp knives, but still the men

work on plunging the heavy instrument deep down into the hard and merciless soil. Hands are chopped, and now they crack and bleed, but the doctor says with inhuman indifference that the application of any kind of emollient to the parts would only worsen them, and so the men work on, and soon encounter a day upon which even the very elements seem to be at war with them, for the wind and weather are so severe and remorseless that our men would appear almost defeated,—by this strange combination of human and divine ordering. Their feeble frames are now seen to waver, the tears roll down unknown to them, the blood trickles from the cracks and rents and lo! a few succumb and faint against the demands of the unequal odds.

Truly it has been said of old "the spirit indeed is willing but the flesh is weak." The food, insufficient both in quantity and quality, having been partaken, the men take up the task afresh, and now very mother earth seems to have combined with the elements, our men wield their weapons of labour with all their might and main, and the weapons break or bend upon the unrelenting rock and soil. The continued severe frosty weather call for some food element to maintain the bodily temperature.

For this reason ghee was applied for and was refused though the same had been previously granted. The result was that in spite of our men being in a delicate and emaciated condition, they declined to partake of any food or nourishment until the ghee had been served out. But they shouldered the pick and the spade, and went forth to their labour all the same. The end was, as to be expected, after many days of such abstention from nourishment a large number of them fainted through sheer physical exhaustion. This remarkable example of passive resistance within passive resistance was a revelation even to our persecutors and admitting complete defeat even

within the prison walls, the authorities ordered the issue of ghee forthwith. This passive resistance within passive resistance—i.e., the fighting for rights within the prison walls—resulted in much added tyranny and persecutions. For insistence upon our legitimate rights after incarceration, we were subjected to solitary confinement, spare diet, and other forms of punishment provided under the prison rules. Such is a side glance into the life of the Passive Resister at work. And now it cannot but be natural to enquire into the evolution of this highly interesting spectacle of united effort. How come the Hindu, the Christian, the Mahomedan, and the Parsee, to stand as one undivided whole, shoulder to shoulder, as they had never done before. It is out of place here to dwell upon the glories of so unprecedented a picture. The lessons of it are self-evident. It is needless to insist on the obvious. But, even if the political victory which we are about to consummate, had not been secured by this unique combination, a greater victory has certainly been achieved by this remarkable joining of hands and hearts of the various sections of our communities. It is a matter that must be patent to all that for the union of diverse men and minds, some cohesive and adhesive elements are imperatively necessary. But a greater necessity would also be readily foreseen. It is clear that the would-be partners of the proposed union should, besides contributing adhesive and cohesive forces, as a matter of course divest and denude themselves of all elements of non-assimilable nature. The point need not be proved that this remarkable union of the once incompatible and diverse elements of Mahomedans, Hindus, Parsees and Christians, would be a matter of impossibility if each individual partner did not sink his prejudices and all that makes for self, and self-righteousness with undisguised contempt, into the background, as being unworthy of the most moderate intelligence. There are a good many of us to whom the great

victory has been, not over the Government of the country, but victory over ourselves. "Man, know thyself" is a piece of sage advice which has now been long before the world. It is impossible therefore to know others unless we know ourselves. Passive Resistance has served us in this wider direction that it has enabled us to know ourselves. And knowing ourselves we knew, as a matter of course, others, with the inevitable result that things of the same nature united, with no apparent external exertion, into one whole, seeing with one eye, feeling with one heart, and acting with one mind.

WAR AND PEACE.

BY

MR. V. V. SRINIVASAN.

If war would foster national art,
And war should test the manly heart,
And war must whet his valourous part,
Ay! what care we how good peace be?

If plenty be the bride of peace,
And peace should breed unmanly ease,
And sloth intemperance increase,
Why, what care we what else peace be?

If peace promote internal strife,
And thus wear out a nation's life,
And civil broils should hence grow rife,
Ay! what care we whate'er peace be?

If one sole aim unite us all
As men in deed to fight or fall,
And sport with sword or red-hot ball,
Then what care we how's or peace be?

The arbiters presume to meet,
At name of war they stamp their feet,
In fiery speech the air they beat,
Ah! all for peace that cannot be.

THE NEW SOCIAL DEMOCRACY.*

A REVIEW BY

MR. C. R. SRINIVASARANGACHARIAR, B. A.

The author traces the Social Democratic Movement from Karl Marx and Proudhon. He makes a beautiful remark that the idea of people's rights was expressed by Burke himself who was thought a monarchist and that the idea of the surplus value of labour as due to the labourer was expounded by Adam Smith himself. When Burke said that the American Colonies should not be taxed without representation, he pleaded the cause of the people. Adam Smith was for unearned increment going to the credit of the labourer.

Karl Marx, the German Social Reformer was the first organiser of the International Conference of Labourists. He was led by Hegelian philosophy. He discussed its principles with Proudhon for whole nights; he was for collectivism while Proudhon was for federalism. The former was a more learned and better organiser, the latter a better dictator of the nobler impulses of the movement.

Karl Marx's attempt to have a Parliament of men was unsuccessful, as the needs and conditions of different nations differ. The New Socialism has seen his other notions to be false. According to him, the smaller shop-keepers would be swallowed by the capitalists, and these by the state. But later experience has proved that shop-keepers thrive and that Trusts, as in America, are powerful. The English people understand Marx not directly but through commentators; so, he is not as well understood as he deserves. They only know that even his own followers differed from him at the second International Conference held at Brussels,

* "The New Social Democracy, A study for the Times." By J. H. Harley, M.A., Vice President of Union of Journalists, London, P. S. King & Son, Price 6s.

and that collectivism has proved a failure even in Australia where the fourth estate has all the power in both the Lower and Upper Houses. The New Socialism unlike Marx, has found it necessary to exercise influence through Parliaments. In England Keir Hardie and Robert Burns took the lead. Labour representatives were returned to Parliament. Labourists wielded power in the two previous General Elections. The latter of them showed, though Macdonnell thought otherwise, that the Labourists could not form an independent party but only be powerful by joining the Liberals. Karl Marx and Keir Hardie agree in not caring for the personal views of the Sovereign; but the former places the King at the apex of social institutions. In England, Socialism has been progressing since Gladstone's Midlothian Campaign of 1879 and Home Rule Bill. In France, Anatole France and Proudhon preached and worked for the cause of Labourers. Proudhon's proposition "Property is robbery" was not properly understood. At the International Conference it was outvoted by 691 against 2. He merely drew the distinction between land merely owned by men and land cultivated by labourers. Though then abused as an Anarchist, the centenary of his birth was celebrated in 1909 in all European countries. His idea of Federalism has come to stay. The chief reason for the defect of the old Socialism was due to the absence, at that time, of the development of Sociology. But Sociology has now proved that economy is intertwinced with psychology, politics and education. If we understand associations aright, they may be arranged in a grade beginning with simpler ones and leading to those where voluntary action is greater. They are:—

1. Domestic Associations,
2. Economic do.
3. Religious do.
4. Juristic do.
5. Political do.
6. Rational do.

The New Socialism has wedded itself to religion and the priests of orthodox Christianity also preach equality and the cause of labour. Out of the world's population one third is Christian and out of this, a far larger number than at present exists, ought to find place in the Socialist ranks. There are only 25,000,000 Electors amongst Labourers in the whole world! A poor figure indeed compared with the total world's population of 1,544,510,000.

The author has given statistics of international value showing the position of Labourists from the elections of various countries, from their percentages in the parliament or the legislative bodies. Finland has a percentage of 42 under peculiar conditions; so, we may consider others. Sweden, Denmark, Belgium and Luxemburg have each about 20 per cent; Austria, 17 per cent; France 13 per cent, Germany, 11 per cent; Great Britain, 6 per cent, priest-ridden Spain has got 25 per cent, the lowest in the scale. The author has taken great pains to collect information up to 1910 and to trace matters with particular care specially from 1900. The last two chapters must be read in the original itself. Acute intelligence is exhibited in the very last entitled "Reviews and Conclusions." While the important matter has been touched on here, we should not like to stand between the author in his two last chapters and the careful, patient readers of details viewed in the light of principles.

We must heartily commend the labour of the author and the keenness of his perception. We only pray for the cultivation of a similar spirit of research amongst Indian citizens with respect to Indian Economics and Labour.

Current Events.

BY RAJOUARI.

THE COAL STRIKE AND PEACE.

At last the coalminers have resumed their work; and peace between themselves and their employers has been established. Let us devoutly hope that it is a lasting truce and that none of the economic disasters which followed in the train of the strike for some weeks would ever again befall the country. The coalminers have shown how they could stand shoulder to shoulder in their own interests, how a common cause could unite them and how far they could be strong with union among their own order. Their grievance was a perfectly justifiable one. It is, however, a great pity that that grievance has been redressed at a sacrifice which they could ill afford. To go voluntarily on strike for many a week and deprive themselves of their wages to the colossal figure of 6 millions sterling is no ordinary sacrifice. Worse still, that in order to maintain themselves during the period of privation and distress, self-imposed, the amount accumulated from year to year to meet a rainy day has been almost swept away. Over a million had to be drawn upon to maintain themselves. It is to be hoped both employers and employed have been chastened by the experience undergone during the period that the strike lasted. Your capitalist captain of industry cannot in future be so blind to his own interests and so unjust to the producers of wealth as to ignore or treat with callous indifference their fair and reasonable claim to participate in their growing prosperity. Where would all large employers of industry be without the working men? It is they who produce wealth from which their own wages are paid, the other charges of production are disbursed and the profits made which repay the capitalists or the

shareholders their interest or dividend. So long the men were undergoing a severe training and discipline, splendidly assisted by elementary education for the masses which the wisdom of the statesmen of the generations gone by provided at enormous cost to the State, they abided their time. In days gone by they were so many machines. Now they are a strong guild who can think and act for themselves, and organise for the better conservation of their own interests and greater welfare. They are no longer mere *working hands*. They are *men of thought and action*. The general strike is a logical sequence of the educational and political evolution going on this half a century and more. *Profit sharing* already in vogue, though to a limited extent, must more largely be resorted to. Wherever this has been introduced with care and forethought, so that no interests are unduly advanced or grossly neglected, there has been achieved complete success.

But in respect of this general strike, this new conception of strike which consists in an economic revolt against all employers instead of a quarrel with a few and limited in number, there has been said a good deal in the British and Continental Press about what is called *Syndicalism*. Syndicalism, it should be remembered, had its genesis in France. It is held to be a revolutionary movement and possesses all the active germs of violent idealism of the easily excitable French. This shibboleth has for its object this only: *the right of labour to the whole product*! It is a militant idea which vastly commends itself to the bourgeoisie of the French population. In the words of Mr. Lowes Dickinson: "it is a spirit seeking incarnation. In many ways and at many points—by co-operation, by profit-sharing, by the single tax, by nationalisation, it seeks to effect an entry and find embodiment in the real world. Syndicalism is one such attempt and the most desperate. In short it declares that 'the State is Bourgeoisie'." Thus it will be readily con-

ceived that it is no philosophical idea. Nor for that matter, is it philosophy. No. It is a revolutionary creed. Its propaganda is a crusade against the capitalist. It may by and by develop into a force by reason of the discontent which a Government may sow deep and broad. But let us hope it will not. At any rate Syndicalism among the sturdy, unimaginative, unidealistic working classes of England is not possible. But it behoves all educated classes of the people, capitalists included, to carefully watch it and take means betimes that the French canker gnaws not into the vitals of the British working classes. That means that the British should not ignore the just grievances of the workers as was the case in the coal strike. Let it be remembered that Syndicalism teaches that industries should be only controlled by those who work the industries. It is in this teaching that the vital energy of Syndicalism lies. In the proposition that that teaching makes a headway among the workers, will be its force. To ignore this latent force would be worse than a folly. *Statesmanship lies in directing its energy into safe and useful channels.*

Mr. Asquith, of course, has produced his Home Bill and despite the croakings and the groanings of the Opposition and despite the gibes, the jeers, and the hollow Phariseism of Mr. Balfour, it is bound to pass into law in the House of Commons where it has already passed the first reading. Presumably, there will be some modifications in the details of the Bill, but there can be none as to the principle. The principle has been affirmed by a large majority which views it with a clear gaze and an irreproachable conscience. How the measure will fare at the hands of the Upper House remains to be seen. No doubt Ulster will fight there; but there will be few to bless Ulster and declare it to be right. Be the fate of the Third Irish Home Rule Bill what it may, there can be no doubt that sooner or later Ireland will have her wish grati-

fied. Ireland will be autonomous with the new Irish Parliament once more sitting at Dublin. It will be a day of rejoicing not only for the Irish but for all oppressed nationalities, nationalities vastly obsessed by power and privilege. The battle for the freedom of Ireland must be fought and won.

Lastly, a gloom has been cast over all England by the terrible loss of lives in consequence of the disaster which has befallen the steamship "Titanic," a Titan of vessels indeed she was. But a greater Titan, invincible but indestructible, has in a trice sent her down fifteen thousand feet at the bottom of the Atlantic. The tragedy is unspeakable, and thousands both in England and America mourn the fate that has overtaken their nearest and dearest. The catastrophe is indeed appalling in its suddenness and swiftness and heart-rending in the human sacrifices that the ocean has claimed as its own! How powerless is man while strenuously endeavouring to overcome Nature! How Nature revenges keenly and teaches vain humanity that despite all progress of science, it is presumption on its part to override her settled ordinances!

Yet another year of highly prosperous finance. Mr. Lloyd George is a lucky Chancellor of the Exchequer. The official year which closed on 31st March last gave a revenue of 185 million £ and an expenditure of 178 million, resulting in a surplus of 6 millions. Save the tea duty all heads of taxation gave a large increase. The prosperity of the budget may be clearly seen in the lines on which the genius of Mr. Lloyd George framed the budget of 1909—the famous budget which was the spring of that mighty cause of constitutional strife between the Commons and the Lords. Evidently this is a constructive statesmanship of a high order. Old age pensions and state insurance between them have alone demanded 16 millions sterling. But the new basis on which Mr. George founded his taxation in the memorable year 1909

has been prolific of the expanded income now yielding to the State. What is more to be rejoiced at is the enormous growth of the foreign trade. Imports and exports have mounted high by leaps and bounds. Mr. Bonar Law and his brave band of tariff reformers might well have an honest searching of the heart. Let their conscience avow whether Probative Finance could have yielded such glorious gains to British commerce as have been poured into the lap of Mr. Lloyd George by a fearless policy of Free Trade!

THE CONTINENT.

Though the German Emperor went abroad on his high diplomatic emprise, it must be acknowledged that it has not met with the object with which he set out from Berlin. He has not satisfied Italy. Neither has he satisfied Turkey in whose behalf he specially made his political pilgrimage to the Quirinal. As a matter of fact while the deadlock which the Tripolian war has wrought is not removed, Russia has improved her relations with Turkey which has led many a politician to inquire whether Germany's influence with the Porte has declined. The Kaiser has sorely disappointed the Italians, and it is a serious question whether the Triple Alliance is a reality or a fiction. Neither has the optimism of the Austrian Press been in any degree realised, the optimism which was so ripe in its columns just as the Kaiser set out on his journey. The aged Emperor Joseph no doubt embraced his younger brother on the Hohenzollern throne; but the German Press is quite reticent as to the real result of the interview. The question is whether Italy can ever be an active member of the Triple Alliance? There are many who shake their head. The alliance, unnatural from the first, is even more unnatural to-day. Evidently Russia at present is posing as a better friend of Turkey than Germany. If eventually Turkey makes better friends with her hereditary foes—times are so altered—the power and influence of Germany

in the East must wane. And what with the dissection of Italy and the absolute certainty of a separation from Austria as soon as the grave closes on Emperor Joseph, which is not a distant contingency, Europe is bound to shuffle her cards. Russia and France may again have a political ascendancy which could not be deemed negligible.

However let us wait and see. The Kaiser's visit to Vienna and Rome must be deemed infructuous of those political results which were expected in high quarters. Austria has just escaped the Hungarian separation. The Parliamentary resolution of Hungary to deprive the Emperor of his prerogative of maintaining the necessary forces gave deep umbrage to him. He threatened to *abdicate*! The threat was enough to compel the Hungarian Prime Minister to rescind or withdraw the resolution. But this is only an armed truce which will last only so long as the Emperor Joseph survives. But his days are drawing nearer and nearer. Till then Hungary may possess her soul in patience. But there are not wanting other symptoms to inform us that below the surface is seething a huge volcano. We tremble to think when it may erupt and what ills it may bring forth to the Eastern Continental Powers. The bolt in the blue may overpower them any day. Domestic finance also in Austria and Hungary is causing trouble which may lead to some financial catastrophe.

In Italy the reaction against the war, which is dragging on an inglorious existence, is spreading, specially in rural districts. The absence of so many conscripts of the yeoman class is causing great vexation. The flower of the robust peasantry is drafted to a region neither congenial to their taste nor favourable to their health. Some bye-elections have exactly indicated which way this wind of reaction is blowing. It bodes no good to Italy and the war party may soon be defeated. Turkey is playing an excellent waiting game. She is allowing Italy to exhaust her resources and the

patience of the peasantry. Meanwhile Italy is making some minor repulsals and endeavouring to force the Dardanelles. That again opens up a big international question. Verily, Italy is just now between the devil and the deep sea, and lucky would she be if she could close this inglorious war, so unrighteous in its very inception, with credit to herself and her reputation as one of the limbs of the Triple Alliance.

As to Turkey, it is a matter of regret that she is making no headway in domestic affairs. Macedonia and Albania are in a state of great unrest which may lead to some untoward events later on unless the Home Secretary adopts a better policy of conciliation towards these two provinces with a Christian and Mahomedan population. The policy of *Turkeyfying* these, in pursuance of the strong influence of the Secret Committee of Union and Progress, is foredoomed to failure. But it would seem that no statesman has yet risen equal to the occasion to put an end to the chronic internal disorders in Macedonia and Albania and lift up domestic Turkey herself to a higher and non-salutary plane where she can breathe freely—politically and financially.

PERSIA.

The other day the Foreign Office issued its Blue book on Persia which is hardly informing of events up to date. Indeed it has been a subject of complaint by the independent British Press that Sir Edward Grey has published all correspondence and telegrams to a certain date, say, 31st September 1911! What about the stirring events that have transpired during the succeeding six months. The *Manchester Guardian* truly observes that the blue book published does not add much to our knowledge. "Two things matter. When are the foreign troops to be withdrawn from Persia? And, secondly, what is the nature of the control to be exercised by England and Russia as the result of the last ultimatum which led to the retirement of Mr. Shuster?"

Neither question is answered and are not likely to be answered unless events again force Sir Edward Grey to be less secretive than he is. Russia has a nasty trick, no doubt acquired by long experience of the politics of Great Britain, of taking sinister measures of her own, be they in India or Afghanistan or Persia, during the autumn when Parliament is not sitting. In the past she did many untoward things, aye, alarming enough, on the Indian frontiers, during that season which is most favourable to her Tartarian strategy. The *Guardian* is so awfully vexed at the studied edition of the latest Persian Blue book that it delivers itself of this Parthian shot. "We are still left in ignorance, only relieved by such information as we can pick up from Russian and German papers and from ambiguous but disquieting statements by the Foreign Secretary in the House of Commons. If the Foreign Office, when it publishes a set of papers after the case is over, cannot bring them beyond the point at which it was just beginning, it is incompetent and its methods are in need of reform". These observations indicate the measure of the resentment felt by the independent British Press at the incompetency, and more than incompetency, of Sir Edward Grey to be any longer at the head of the British Foreign Office. Meanwhile it remains to be seen how far order is being restored in Southern Persia and how Russia is redeeming her promise to evacuate Northern Persia of the troops that she has massed there.

THE INTRIGUING DALAI LAMA.

The Dalai Lama is still in the vicinity of Darjeeling where he is holding his own court and playing the high game of politics with his favourite Lamas and some Europeans who promise to support him when he is again installed at Lhasa. Exaggerated accounts, of a most misleading character, with the sinister design of spreading alarm at headquarters, seem to be continually flashed here especially of the supposed

bloody conflicts between the Chinese troops and the inimical Lamas. We entirely disbelieve these reports which have something very malignant behind them. And this illstarred Lama seems destined to play all sorts of pranks and intrigues meanwhile with those who feed him on false hopes. It is much to be wished that Lord Hardinge will try to keep this mischievous bird in his gilded cage somewhere in the vicinity of Delhi or Simla. This born intriguer must be for ever prevented from reigning or ruling at Lhasa.

CHINA.

Not much is heard of Republican China or her first President. There is a lull in Chinese politics. Now and again we hear reports of disorder and looting in Nanking and the Southern provinces but nothing beyond. Whether this is the proverbial lull which precedes a storm it is not possible to say. Are they all busy constitution-mongering? If so, we should soon hear of the formation of the constituent Assembly and the meeting of the first Republican Parliament in immemorial and conservative China. Only the Japanese and the Russians seem to be pulling the strings in some quarters and making the other Great Powers acquainted with their rights, privileges and spheres of influence under so-called treaties and conventions. Both are interested Powers and both should be greatly distrusted as far as their outward friendly relations with China are concerned. All, however, wish that the sooner is the Republic settled down and recognised by the Powers the better. China has a magnificent economic future before her. Given a stable government and ample borrowings, China is bound to construct the railways which she still wants and immensely advance all industries, specially cotton. The currency, too, demands stability. Silver alone will be her salvation so far. In all probability our doctrinaire currency doctors at Calcutta may be given a wrinkle or two when the silver currency is the law of the land among the Celestials.

THE WORLD OF BOOKS.

[Short Notices only appear in this Section.]

Photographing the Invisible. By James Coates, London, (L. N. Fowler & Co.)

All students of spiritualism will welcome with great interest this work of Dr. Coates, wherein the evidence for psychic photography and psychic paintings and writings is set out in very simple, sober, and clear language. It is a fair and successful attempt to present facts unencumbered with theories which are usually repulsive to readers prejudiced against Psychic phenomena generally. Even the most sceptic mind cannot but feel, after a perusal of this book, that the mass of carefully collected testimony vouched for by respectable people strongly points to the existence of intelligences beyond our normal ken, which mysteriously endeavour to protrude themselves into human life, and upset accepted notions of science and psychology. It is evident that the time is past when all such phenomena may be brushed aside as fraudulent. The simple, credulous man may continue to be imposed upon by frauds in spiritualism as in other matters, but the rigorous investigator owes a duty to the public to state facts, sifted of course to the best of his ability, and it must be left to the future of science to find the reason why. A very interesting portion of the work is the chapter on Psychic portraits by invisible Artists, through the Bangs Sisters of Chicago, and the testimony of two well-known Hindu gentlemen will be of interest to readers here: Mr. G. Subba Rao of the *West Coast Spectator*, obtained a portrait of his deceased wife, precipitated by some 'supernatural agency' (to quote his words), on a canvas selected by him. The late Babu Shishir Kumar Ghose, the well-known Editor of the *Amrita Dazar Patrika* of Calcutta obtained through a Chicago lady a painted portrait of a deceased son of his, also through the agency of the Bangs Sisters.

The Civic and National Ideals. By Sister Nivedita. Published by the Sri Ramakrishna Mission, Mylapore, Madras. (Price Rs 1 Postage extra.)

Our readers may be already aware of the fact that Sister Nivedita, one of the great Western disciples of the Swami Vivekananda, and the well-known author of "The Web of Indian Life," "Cradle Tales of Hinduism" and "The Master as I saw him" etc., has left all her writings for the furtherance of the cause of the education of Indian women. Many of her writings still remain unpublished and are not available for the public. The Udbodhan Office in Calcutta has laid the educated community under a deep debt of gratitude by its noble task of publishing these volumes. "The Civic and National Ideals" is the first of the series, consists of 148 pages, and has been very neatly got up by the Lakshmi Printing Works, Calcutta.

The book is interesting and instructive and possesses many intrinsic merits; coming as it does from an English lady, it has a special value. It shows in unmistakable terms that sympathy, fellow feeling, and an earnestness to know things at first hand help one to gain a true insight into foreign customs, manners and institutions.

Sister Nivedita has by her characteristic intuitive method of perception been able to discern the germs of civic and national ideals in our ancient institutions, which many of the Anglo-Indian critics have failed to note. To her, India's past and present augur well a bright future, and the realisation of an Indian nationality is not a day-dream. A healthy tone of inspiring optimism pervades the whole book. Our two great epics, the Ramayana and Mahabharata, reveal to her the pre-existence of civic and national ideals of a fine type. Our architecture with its front verandahs and stone rouches, our temples, bathing ghats, public wells

and gathering places are mute witnesses which bear testimony to the communal life and consciousness of the people. Some of our habits are evidences of a vast civic culture and hospitality. The whole Indian ideal of enjoyment is communal and our marriage processions are cited as special instances in point. Even the much maligned but very often ill-understood caste system is, in her eyes, capable of proving rather favourable than otherwise to the solidarity of public life. Social uniformity is not absolutely necessary for the attainment of communal unity. On the other hand the system provides an excellent frame work for labour organisations and other forms of socio-political activity. Indian art, sculpture, and painting are also in her opinion potent factors in shaping Indian nationality.

Space forbids us to dwell at greater length on the many convincing arguments advanced by the author to support a possible realisation of Indian Nationality. But we cannot help quoting the following extract which bears out fully her conclusions — "Any country which is geographically distinct, has the power to become the cradle of a nationality. National unity is dependent upon place. The rank of a nation in humanity is determined by the complexity and potentiality of its component parts. What any one of its elements has achieved in the past, the nation may expect to attain, as a whole, in the future. Complexity of elements, when duly subordinated to the nationalising influence of place, is a source of strength, and not weakness to a nation."

The book is full of valuable suggestions and observations for our improvement which deserve the closest attention of all thinking men, and we have great pleasure in commending it to our readers.

It is moderately priced, so that it may be available to all classes of people.

The Indian Nation Builders, Vol. III :— Messrs. Ganesh & Co., Publishers, Madras, have brought out the III volume of their "Indian Nation Builders" series, the first two volumes of which are already before the public. In the present volume we have excellent sketches, with portraits of twelve distinguished Indians, viz : Sir Gurudas Banerjee, Sir Syed Ahmed Khan, Pandit Ajojanath, K. T. Telang, H. H. The late Nizam of Hyderabad, M. K. Ghandi, Babu Arabinda Ghose, Babu Aswani Kumar Dutt, Dr. A. K. Coomaraswamy, Rabindranath Tagore, Sir K. Seshadri Aiyar and Bankim Chandra Chatterjee. Of even greater value than the life sketches are the utterances of these distinguished men reproduced in this volume. The volume is full cloth bound and is priced Rs. 1-8-0

Ajmer: Historical and descriptive. By Har Bilas Sarda, B. A., F. R. S. L. (Scottish Mission Industries Company, Ltd., Ajmer)

Both in the history of the Moghals and in the history of the Hindus Ajmer has been a celebrated city. As the last capital of the Hindu Empire, it is full of places of historical interest. Mr. Sarda has had access to all materials for his work. His father was Librarian of the Ajmer Government College for nearly a quarter of a century, and the author has been able to make use of the requisite materials at his disposal furnished by the Asiatic Society of Bengal and the Royal Asiatic Society of Great Britain and Ireland. The book displays great original research. Several vernacular inscriptions and plates have been used in the compilation of this work. There are some twenty-eight full page illustrations and maps elucidating the respective periods of Ajmer history. The book is dedicated to the Hon. Sir Elliot Graham Colvin, K. C. S. I., C. S. I., I. C. S., Agent to the Governor-General for Rajputana and Chief Commissioner, Ajmer-Merwara, whose portrait forms the frontispiece of the volume before us.

Health for Young and Old. By A. T. Schofield *Need*

On the title-page the author describes this book as an "unconventional manual" and emphasises this fact once more in the preface, on the ground of being devoid of ordinary statistics and diet tables which one usually expects to find in hand-books on Hygiene. But considering the class of lay readers likely to make use of this book, the omission does not strike us as one on which the author need pride himself. Text-books on Public Health appealing to professional people and students ought to contain tables of dietaries and vital statistics. This criticism in no way detracts from the excellence of the book under review. Dr. Schofield treats in detail of the principles that underlie all questions of health. The whole secret of preserving health is summed up in the saying that "life should be lived unconsciously". The moment that one becomes conscious of the action of internal organs e. g., waist, stomach, lungs, brain etc., one may safely presume that something has gone wrong. So far as India is concerned we cannot agree with the author's dictum that "the hot bath with soap should not be used every day." Even in England the daily hot bath need not be condemned. In all other respects, such as, what to eat, what to do, what to wear, etc., we are at one with Dr. Schofield. We would particularly commend the chapter on "What to Breathe." This is full of sound advice which all would do well to follow. On the whole the book may be accepted as a safe guide to personal Hygiene.

An Essay on W. E. Gladstone. By Mr. Ramanuja Swami, B. A., B. L. (Ananda Press, Madras.)

This is the substance of an address delivered by the author at a public meeting held under the auspices of the Ganjam Graduates' Association at the Kallikota Diamond Jubilee Town Hall, Berhampore.

Delhi: The Imperial City. By Mr. J. Renton Denning: printed at the Times Press, Bombay and published by the author.

The Kutb Minar. By Mr. Rustamji Nasarvanji Munshi, Bombay. Available at G. A. Natesan & Co. Price Rs. 1-8-0.

Both are valuable guide books to tourists in Northern India. The authors have displayed considerable powers of research and no pain has been spared in making the archaeological aspect of the city really interesting to laymen. Amply illustrated, they supply a fund of information relating to the conditions of Delhi, past and present which must be invaluable to strangers. Delhi is essentially an oriental city and the atmosphere is pre-eminently Mussalman. The books therefore throw much light on the civilization of the Moghul times. The ruins of such a place will form an excellent study to students of social science and archaeological aptitudes.

The Sterling Debt of India. By Mr. M. R. Sundaram Aiyar B.A., B.L., Law Printing Works Madras.

In this pamphlet the author has discussed at some length the financial, political and economic objections against all sterling loans and in particular against the Special Gold Loan. The Government of India after full consideration has indeed abandoned the proposal, as originally announced, of raising a Special Gold Loan. But during the Budget debate in the Imperial Council the Hon. Mr. Gokhale moved a resolution that the Government of India should adopt the original scheme of raising a gold loan for the financing of the new capital. There are again some others who seem to support the Hon'ble Member's motion and the present pamphlet is a refutation of their theory. The author says that the growth of the Sterling Debt is fraught with grave dangers and "that under the present economic and social conditions, the employment of Indian capital for State loans raised for unproductive purposes, causes a profitless diversion and drains the life-blood, which cannot but produce industrial and commercial anæmia fatal to the well-being of the State."

Shakespeare. By Prof. C. H. Herford. *The People's Books.* (T. C. & E. C. Jack, Ed. Net.)

We have great pleasure in welcoming this new series of cheap original books. The reading public ought to congratulate itself on this privilege of being enabled to get a valuable study of Shakespeare by Professor Herford for the ridiculously small sum of 6d. And we are sure the volume will command extensive popularity among the classes for whom it is intended. The Professor does not commit the mistake of dwelling elaborately on the details of Shakespeare's biography—that would have been undesirable in a volume of only a hundred pages. Nor does he waste much time over the minute points of Shakespearean scholarship and research. In the treatment of the individual plays, his sole aim has been the elucidation of cardinal situation and characters, and he has realised it with great success.

Phrases and Names, Their origins and meanings. By Trench H. Johnson. London: J. Werner Laurie, Clifford's Inn.

Origin and Meanings of Popular phrases and names. By Basil Hargrave. London: J. Werner Laurie Clifford's Inn.

These two volumes contain a concise epitome of the origin and meaning of words and phrases which are in everyday use but which are often not appreciated at their full significance. They are not intended to be exhaustive philological treatises but they throw light on many words recalling their derivations and thus give useful information in a 'pleasant and chatty form.' A great many Americanisms have been included and no care has been spared in making them up-to-date. Such books would, of course, be superseded in the long run but the authors have made them quite an entertaining volume of forgotten lore.

THE LATE MR. W. T. STEAD.

BY MR. B. NATESAN.

It is now clear beyond doubt that Mr. W. T. Stead is not among the few fortunate survivors of the *Titanic* disaster. We must therefore conclude that he has perished in the general cataclysm that overtook the ill-fated vessel. The craze for 'high speed' has resulted in this catastrophe. From the wreck of the *Delhi* in December last to the date of the *Titanic* disaster, there have been a series of successive victims to the sea-monsters. Indeed no single war in recent times has been more destructive of life and property than these unhappy incidents in mid ocean. It has been said that peace hath her victories no less glorious than war; we have to reverse that dictum and say rather, that peace hath her havocs no less perilous than war.

In the death of Mr. Stead, the world has lost one of the foremost men of our time. He was in many respects a very remarkable man and has stamped his name in the memory of his fellow-men as the Prince of Journalists. The facts of his life are easily told. He was born on the 5th of July 1849, at Embleton in Northumberland. The son of a congregational minister the Rev. Mr. W. Stead, he was brought up in the devoutly religious atmosphere of his father's home while yet he was studying at Silcoates School, Wakefield. He was a poor lad. Early in his 14th year he left school and entered as an office boy in a mercantile house at New Castle which was also the Russian Vice-consulate. But he threw himself with ardour into the social and religious work of his father's church, took great interest in the Mutual Improvement Society at Howdon and finally became an assiduous contributor to the "Northern Echo" at Darlington of which he became Editor in his twenty third year. From

this time to the very end of his life he continued to work unceasingly and contributed in no small measure to the "progress of the world."

By character and attainments Mr. Stead was one of those who would make their mark in any age or country. But it is impossible to think of him as anything else than a brilliant journalist. No man had a higher notion of his calling. For forty years continuously, through good report and through evil report, buffeted by a thousand vicissitudes of fortune, he went on working in the true spirit of Browning's Grammarian. Matthew Arnold used to say of Stead that he invented the New Journalism. The notes of the New Journalism are an unerring instinct for the detection of the taste of the people, and the capacity for entertaining the average class of readers. It is not indeed the business of the journalist to feed the intellectuals. That is assuredly the sphere of the philosopher and the sage. But for guiding the public opinion of the average mass of mankind and directing their energy to channels of righteous endeavours, Mr Stead was peculiarly qualified. He did his work with triumphant success. His style had no pretensions to the higher or finer literary qualities. But he owned a style at once clear, simple and effective. And though he had no ear for the delicate shades and subtle harmonies of language yet he was abundantly gifted with the qualities that are of undoubted value to a public man—sincerity and courage. He was always conscious of a sacred mission in life which he endeavoured to fulfil in the spirit of a mediæval evangelist.

His contributions to the "Northern Echo" soon brought him into considerable prominence. His discourses on the Eastern Question arrested the notice of Mr. Gladstone who wrote to him in these admiring words:—"I have read them with much admiration of the public spirit as well as the ability with which they are written. I wish that our whole Press was distinguished equally

for its justice, heartiness and ability." Soon after in September 1880, Mr. John Morley, then editor of the "Pall Mall Gazette" took him to London as Assistant Editor of that Liberal Organ. In 1883, he succeeded his chief in the editorial chair and controlled the policy of that paper till 1889. Meanwhile his star had risen and the leading men of London became his associates. He was then able to interview many responsible statesmen and the introduction of the practice of interviewing in English journalism may thus be credited to him. Indeed as an interviewer Mr Stead had few equals and he made it an effective weapon of no common service to the State. Though it is regretted that his interview with Fisher of Australian fame created a sensation by making the Premier pronounce unimperial sentiments, it is equally to be remembered that when the Government was hesitating, it was Mr. Stead that inspired the Cabinet to choose Gordon of Soudan for that expedition by the report of his interview with that General at Southampton.

Some of his pamphlets had created quite a sensation in the world of affairs. Very often he had been instrumental in changing the policy of the Government on questions of momentous import. "The truth about the Navy and its Coal- ing Stations" which appeared in 1884, decidedly influenced the policy of the admiralty. But the revelations of the "Maiden Tribute to Modern Babylon" brought him imprisonment for some months though he lived to see his altruistic motives vindicated. Again in 1886, when the Irish question was in the fore-front, he published the results of his investigations in a pamphlet, "No Reduction, No Rent: A Plea for the Plan of Campaign." Nor were his efforts limited to his own country. Always a friend of Russia, he visited that country in 1888 and published "The Truth about Russia." The next year he brought out "The Pope and the New Era" in which was published his experiences

in Rome. In December 1889, he left his connections with the *Pall Mall* and started the *Review of Reviews* which, he was editing with so much credit and success till the close of his earthly career. With the starting of the famous *Review* he began to take a wider outlook of affairs. All things and all people interested him equally and he made it a cosmopolitan organ in the interest of humanity at large. His soul knew no bounds, no limitations. The five-fold ideal of the *Review of Reviews* will explain the mission of the prophet

- 1 International brotherhood on the basis of justice and rational freedom, manifesting itself in universal *entente cordiale*, Anglo American re-union, inter-colonial intimacy and helpful sympathy with subject races, and international arbitration.
- 2 The re-union of all Religions on the twofold basis of the Union of all who Love in the Service of all who Suffer, and the scientific investigation of the law of God as revealed in the material and spiritual world.
- 3 The recognition of the Humanity and citizenship of Woman embodied in the saying, whatsoever ye would that woman should do unto you, do ye even so unto her.
- 4 The improvement of the condition of the people, having as our guiding principle "Put yourself in their place and think how you would like it."
- 5 The quickening and inspiration of life, by the promotion of reading, physical training, open air games, and the study and practice of music and the drama.

Always the champion of oppressed nationalities he advocated in turn the cause of South Africa, Turkey and India. He opposed the Boer War vehemently but he was an ardent admirer of Cecil Rhodes over whom he had considerable influence especially with reference to his will. He hailed with delight the new constitution of the young Turks and supported the cause of the crescent with great warmth. India was particularly dear to him. He would have come to India a couple of years ago to attend the Congress and study the situation on the spot but circumstances over which he could have no control stood in his way and postponed his journey. He died without seeing our shores. But he watched the pro-

gress of events in India with all his glowing enthusiasm for righteous causes and declared his sympathy for the progressive movement in India in unmistakable terms. He realized that India was in a stage of transition and hailed the Indian Council Reforms with deserved compliments to his old chief. He was a zealous supporter of the National Congress and watched with care and solicitude the evolution of an Oriental Parliament. At a time when the loyalty of the Indian people was suspected and the Indian Press was vigilantly suppressed, he boldly espoused the cause of free speech, denounced the irresponsible imputations of some conservative organs and courageously vindicated the just claims and the fidelity of the Indian public; verily he was a friend of India.

Indeed, his love for India was only a part of his general love for all things oriental. Some years ago, in his excellent book on "The Americanization of the World" he observed that the restless energy of the West is misdirected and a little orientalizing will be a good antidote. "We are always catching trains," he said, "and there is no time to think of our souls." The sordid materialism of the occident was rather unpleasant to him and he would have a little of the oriental mysticism. Writing on Asia as a conqueror he observed:—

"To-day, every European, if he thinks or speaks of God at all, thinks and speaks of Him in terms that were first syllabled by Asiatics. Moses, Jesus, Paul, Mohammed, Zoroaster, Buddha, Confucius—these Asiatics to this day teach Europe, her philosophers and her churchmen, what is the truth of the universe, the secret of the invisible, the way of the Lord. Europe invents pulleys, locomotives, maxims and iron clads. But these things perish with the using. Asia produces prophets, apostles, and seers. She creates religious systems, builds up philosophies, and leaving the base mechanic world to the Cindrella of the West, reigns supreme in the world of thought and finds her congenial sphere in the universe of the infinite."

Of late years Mr. Stead devoted himself largely to spirit communication with the other world through "Julia's Bureau." It would not be fair to speak slightly of his interview with Mr.

Gladstone on the Budget of 1909, especially as the occult sciences are getting currency in the world of positive thought. The sciences are yet in their primitive stage and time alone will show how far his interviews with the departed are credible. Long ago he was editing an occult paper, *The Borderland* between 1893 and 1897 to discuss subjects of a spiritual concern. His "Books for Bairns" and the selections from Masterpieces are read by children in countless numbers. He was also an advocate of Women's suffrage. Indeed his sympathy was wide enough for all causes and he lived a laborious life full of benevolent purposes and righteous endeavours. Indeed he worked like

One who never turned his back but marched breast forward,

Never doubted clouds would break,
Never dreamed, though right were worsted, wrong
would triumph,

It is impossible to estimate in any measure the life work of a man of such noble gifts and manifold sympathies in so short a space as we can now command. Forty years of strenuous life are now closed. The future biographer will have ample materials for his work. Contemporary records are enormous. His own works are as varied as they are voluminous. To-day, they are a profuse monument of ruin. They served a great purpose some time ago. But now they are of little interest. They have done their work. They repose in silence and oblivion and will seldom be disturbed by any in their tomb. Mr. Stead himself did not care for fame of any kind. Like Jeffray he derived all the inward glow and satisfaction of consciously affecting the destinies of mankind. That was happiness enough for him. But now, the world mourns for him in silence and in sorrow. He was the pivot of the Peace Conference and worked hard to form an International Arbitration Committee of the Great Powers. The success of the Hague Conference in 1899 and after is mainly due to his exertions. Above all his achievements, Mr. Stead was a great and good man. It will be long

before another could take his place in the world. His was a remarkable personality and he earned a deserved popularity which he used for the general good of humanity. Sometime ago *The Strand* represented him as Oliver Cromwell. It is eminently fitting for a great patriot, and a man of action like the late Mr. W. T. Stead. But he was something more. Living as he did in the light of the twentieth century, he had a wider outlook of things, was more cosmopolitan in his sympathies and there was also a mixture of the puritan, the prophet and the evangelist in his composition. He worked as if he felt every instant—"Work while it is called to-day; for the night cometh when no man can work." Even Carlyle so uncompromising an opponent of all things political and journalistic could say of him, "Tell that good man Stead to get on with his work." Such was the nature of the great man now no more on this side of eternity and though a watery grave has now closed around him, the memory of his social service will always be remembered with gratitude and affection by a sympathetic and discerning posterity.

He has joined the choir invisible and has left us but his example to follow and his memory to cherish.

INDIAN MILITARY EXPENDITURE—An Exhaustive and Comprehensive treatment of the question. Full of facts and figures by Mr. Dinshaw Edulji Wacha, Crown Sro. 54 pages, An. 4.

RECENT INDIAN FINANCE—By Mr. Dinshaw Edulji Wacha. A valuable collection of papers relating to Indian Finance dealing with such subjects as, The Case for Indian Reform; The Growth of Expenditure, Enhanced Taxation; Revenue and Expenditure, Reasons for the Deficit, etc. Price As. 4.

INDIAN RAILWAY FINANCE—By Dinshaw Edulji Wacha. Price As. 4.

DINSHAW EDULJI WACHA—An account of his life and career, his services to the Congress movement and copious extracts from his speeches and writings relating among other subjects to all the important questions of Indian economics and finance. Price As. 4.

G. A. Natesan & Co., Sankararam Chetty Street, Madras.

Diary of the Month, March—April 1912.

March 26. In the House of Commons, Mr. Montagu stated that it was intended to appoint a separate Sanitary Commissioner to the Government of India.

March 27. The Reichsrath has rejected a Resolution calling upon Government to introduce a Miner's Minimum Wage Bill.

March 28. At to-day's Meeting of the Bengal Legislative Council, the Orissa Tenancy Bill and the Mining Settlement Bill were passed. This being the last sitting of the Council, several Non Official Members delivered valedictory speeches.

March 29. A Meeting of the representatives of the Hindu and Mahomedan communities was held at the Town Hall, Calcutta, this afternoon, to consider the present situation in Persia and to make a joint appeal to Great Britain asking her interference in the matter of the preservation of the integrity of Persia.

March 30. The Annual Meeting of the Anglo-Indian Association of the United Provinces was held to-day at Allahabad, Sir George Knox presiding.

Sir George Knox was re-elected Honorary President.

March 31. Chinese papers at Peking criticise the Cabinet severely, on the ground that several of the Ministers are inexperienced politically, and unable to inspire confidence in the people.

April 1. Their Excellencies Lord and Lady Carmichael were accorded a very warm welcome on their arrival in Calcutta this evening.

A *Calcutta Gazette Extraordinary* issued to-night contains the Proclamation that Lord Carmichael has assumed charge of office of Governor, and notifications that the Members of the Executive Council (Sir William Duke, Mr. F. C. Lyon and Maulvi Shams ul Huda) have taken upon themselves the execution of their office.

A further notification directs that the Districts of Dinajpur, Jalpaiguri and Darjeeling are formed into a new District Judgeship and Sessions Division, with Headquarters at Dinajpur.

A final notification confirms in their office all officers serving in Bengal.

April 2. In the House of Commons to-day, Mr. Lloyd George introduced the Budget.

The King has sent to Mr. John Burns a thousand guineas for the relief of sufferers by the strike. Queen Mary and Queen Alexandra have each given £1,000. Mr. Burns has undertaken the distribution.

April 3. A Bill has been introduced in the Swedish Parliament conferring upon women the Parliamentary franchise. Women will have the right to stand for election on similar conditions to men. Wives whose husbands have not paid taxes for three years will not have the right to vote.

At question time in the House of Commons, Mr. Montagu said that he had instructed the Sanitary Commissioner to further examine the question of the lymph supply in the Central Provinces from a single central depot. He added that Lord Crewe was not prepared to abolish compulsory vaccination there.

April 4. Replying, in the House of Commons, to Colonel Yate regarding the robberies in Persia, Sir Edward Gray was unable to say whether the payment of British and Indian commercial claims would be one of the objects of the next Loan. Its first objection must be the restoration of order.

April 5. The Sixth Session of the U. P. Provincial Conference opened to day in Cawnpore, a number of delegates from various towns being present besides a large number of visitors. The Hon'ble Mr. Sachidananda Sinha, Member of the Imperial Legislative Council, presided and delivered a lengthy address, in which many important topics of the day were discussed.

April 6. The Bengal Provincial Conference met to-day at Chittagong. The delegates and visitors numbered about three thousand.

Mr. Rasul was then elected President.

April 7. The proceedings at the Miners' Conference were fairly harmonious though the majority contended strongly that the men had been let down. The leaders were confident that the men would obey instructions to resume work.

April 8. The Bengal Social Conference met this morning. Mr. Surendra Nath Banerjee presided.

The Conference adopted a Resolution urging the raising of the marriageable age for girls to sixteen, remarriage of widows and the elevation of the depressed classes.

April 9. An experiment is about to be made by the United Provinces Government with a view to deciding to what extent the establishment of Village Panchayats, as recommended by the Decentralisation Commission, is desirable. It is proposed that Village Committees should be entrusted with small sums of money, granted by District Boards, and told to utilise them as they think best for the purposes of village sanitation. Certain selected Districts Boards will be asked whether they are prepared to try the experiment, and the actual results of the action taken will be observed before any further advance is made.

April 10. King George, in a letter to the Archbishop of Canterbury, with reference to the Primate's circular of the 20th February, inviting the co-operation of certain organisations in England in securing for the Indian Dioceses Chaplains of a high type, says:—

"During my visits to India I had an opportunity of appreciating the excellent work of the Ministers of the Christian religion who serve with the troops and with Civil officials, and I can with pleasure speak of my personal experience of the ministrations of the Anglican Clergy."

April 11. The King has accepted a small gold shield on which is inscribed the following:—"In

thankfulness to God for the shield and protection guarding our beloved King and Queen on their Indian tour 1912—Subscribed for in pennies by the poor loyal subjects of the Church Army, rank and file."

Mr. Asquith in a two hour's speech introduced the Home Rule Bill.

There was a great rush for seats in the House of Commons to day, all being taken, also many in the galleries, soon after the House opened. The House was crowded this afternoon, but not to so great an extent as on the introduction of the two previous Home Rule Bills. No chairs were placed on the floor as in 1886 and 1893.

Mr. Roosevelt has won a great victory over Mr. Taft at the election of delegates at Illinois for the Presidential Convention, thus stimulating the hopes of the ex-President's supporters.

A fruit steamer which has arrived at Mobile, Alabama, reports that thousands have been killed and a number of Indian villages destroyed by an eruption of Chiriqui Peak, Panama.

April 12. Sir Roper Lethbridge, writing to the *Times*, warmly supports the idea of a special representative of India on the Royal Commission to consider the trade resources of the Empire. He points to the Cobdenite views of Lord Inchcape and to the extreme hostility of Sir Edgar Vincent and Mr. Garnett to Indian views on tariff questions, while Mr. Garnett was in 1895 Chairman of the Committee of Employers and Operatives of Lancashire on the Indian cotton duties and the leader of the most powerful and most successful agitation on these questions.

April 13. China is yet unsettled. A mutiny has broken out among the troops at Nanking. The houses and shops were looted and buildings burned.

A Blue Book on Persian affairs has been issued. It includes correspondence between Sir Edward Grey, Sir George Barclay, Mr. Buchanan and others, and comprises 333 Despatches.

April 14. The Senate at Washington : passed a Resolution congratulating the Chinese people on the assumption by them of the powers, duties and responsibilities of self-government.

April 15. It has been decided that, pending the pacification of the troops in the South the Military Commander at Nanking will continue, under the direction of the President, to exercise certain control under which will come the civil, military and diplomatic affairs at Nanking. This decision is considered most important as emphasising Yuan shi-kai's determination to avoid a rupture with the South and a tacit acknowledgement that the South is not yet prepared to dissolve its military organisation.

France and Russia are completely agreed with regard to the participation of the latter country in the Chinese Loan.

Baron Kato, the Japanese Ambassador to Great Britain, has been entertained at a banquet prior to his return to London. Responding to the toast, His Excellency said that he had the assurance of the Prime Minister that they attached the same importance to the Anglo-Japanese Alliance as their predecessors.

April 16. The *Titanic* foundered. The *Olympic* and *Carpathia* have arrived to save the helpless passengers.

A wireless message from the *Olympic* states that the sole survivors are those on board the *Carpathia*. The Second, Third, Fourth and Fifth Officers and the second Marconi operator are the only Officers reported saved.

An electrical disturbance prevents communication with the *Carpathia*. A carefully compiled list of survivors, however, shows that 79 men, 233 women and 16 children have been saved. Of the remaining 510 it is estimated that about 100 belong to the crew.

Two cruisers fitted with very powerful wireless installation have been ordered to meet the *Carpa-*

thia and re-transmit the names of the survivors to the Government.

A message from New York states that the *Carpathia* sent a wireless message at 11 o'clock on Tuesday night, saying that she was 600 miles from New York.

The White Star Line is fitting out the steamer *Mackay-Bennett* to search the zone in which the *Titanic* foundered, for bodies. The vessel is taking tons of ice and scores of coffins.

April 17. The Home Rule Bill has been issued. It enacts that the term of office of the Senators shall be eight years and the duration of the House of Commons five years. The Irish Parliament will be summoned on the first Tuesday in September, 1913, upon which day the Irish Members at Westminster will vacate their seats.

At question time in the House of Commons to-day, Mr. MacCallum Scott asked Mr. Harcourt to use his influence to mitigate the Laws affecting Indians in South Africa.

Mr. Harcourt replied that there was frequent correspondence between the Union of South Africa and the Home Government on Indian matters. He hoped that the Immigration Bill now before the Union Parliament would do something to remove the sense of grievance.

April 18. King George has sent the following cable to President Taft:—

"The Queen and myself are anxious to assure you and the American people of our great sorrow at the terrible loss of life among American citizens and our subjects in the disaster to *Titanic*. Our two countries are so intimately allied by ties of friendship and brotherhood that any misfortune affecting the one must necessarily affect the other. We are both equally sufferers on the present terrible occasion."

Mr. Taft has replied thanking Their Majesties for their message and saying that the American people share the sorrow of their kinsmen.

In the House of Commons to-day, Mr. Montagu presented the India Bill, which is officially described as "A Bill to make such amendment in the Laws relating to the Government of India as are consequential on the appointment of a separate Governor of Fort William in Bengal and other administrative changes in the Local Government of India." The second reading will take place on the 24th instant.

April 19. A telegram from New York, reports that the *Carpathia* arrived at the pier at 8 37 in the evening. The Senate Committee, which is conducting the investigation into the disaster, had intended to board the vessel at sea, but the liner developed an unexpected turn of speed and reached the pier before the Committee arrived. When the *Carpathia* arrived there were 1,000 relatives assembled in the pier sheds, including Mr. Morgan, junior, and representatives of the Widner and Thayer families, who came from Philadelphia in special trains. Automobiles rushed up from outside and brought others, the women wailing as the liner slowly warped into dock. There was some delay in docking the *Carpathia* owing to thirteen of the *Titanic* lifeboats being taken off.

The Committee of the New York Stock Exchange brought to the pier 20,000 dollars collected by the members for distribution to the needy survivors. Numbers of doctors and nurses with two ambulances were in attendance.

April 20. The announcement of the new Indian Loan of £3 millions being under written has depressed the other Indian issues.

The £3 millions Indian 3½ per cent. Loan at 93 as reported by the *Evening Standard* will be issued, but the whole of the instalments will be payable by the 14th June, instead of July, and the full dividend is payable on the 5th July instead of the 1st July.

April 21. The Senate has passed a Resolution advising the President to make Treaties with the

Maritime Powers governing the courses, speed and equipment of ocean liners.

The Annual Meeting of the Association for the Advancement of Scientific and Industrial Education of Indians was held to-day in the Town Hall, Calcutta. The Maharajah of Burdwan presided.

The President, in opening the Meeting, said that within eight years of the existence of the Association a large number of students had been sent abroad. Eighty-one of them had returned, of whom 53 had obtained employment. The Association had helped to start twenty new industries in this country, and it had indirectly helped largely to solve the hitherto vexed question of the sea voyage movement. The Association is sending this year 22 students abroad, 18 to England, two to Japan and two to Germany.

April 22. In the House of Commons, Mr. Montagu moved the Second Reading of the Government of India Bill. He said it was a machinery bill to carry out a policy acclaimed by the vast majority of all classes and races concerned.

Mr. Montagu then proceeded to explain the clauses "separatism." Although he said the Bill only mentioned an Executive Council for Behar and Orissa, the province would also have a Legislative Council, but it was unnecessary to include the provision in the Bill. If the Government were granted the necessary powers, Legislative Councils would be given to Assam and the Central Provinces immediately. The Bill merely consisted of slight alterations in the machinery, enabling a policy to be carried out which met with general acceptance, and which, he believed the House would agree, contained elements of lasting advantage and the germ of improved government in India.

April 23. Accommodation is being found for the Delhi experts at Halcombe. Among those who will be coming up are Captain Swinton, Mr. Brodie, Mr. Lutyens, Mr. Ward and Mr. Montmorency.

Replying to a question by Mr. Field regarding the cotton gambling shops in Calcutta, Mr. Montagu referred Mr. Field to the statement in the Legislative Council, on the 26th February, that legislation with a view to its suppression was being considered. The Board of Trade was not at present prepared to promote an international conference on cotton gambling.

Lord Mersey will preside over the Court of Enquiry into the loss of the *Titanic*. The Court will have the widest powers and will sit immediately. Mr. Buxton and Lord Mersey will have the title of Wreck Commissioners and will be assisted by Amateurs. The Court will be empowered to require the attendance of passengers and crew and to grant prior witnesses maintenance allowance. The White Star Company has undertaken to produce every member of the crew summoned.

April 24 Mr. Gouding will again represent the Government Solicitor at Simla this season and is expected to arrive here early next month. Presumably with the change of the Capital a representative of the Government Solicitor will also be required at Delhi when the Government of India assemble there. Hitherto, he has been represented at Simla only during the absence of the Government from Calcutta.

Notable Books on India

My Indian Reminiscences—By Dr. Paul Deussen, Professor of the University of Kiel, translated by A. King. Dr. Deussen's account of his tour throughout India, his description of its principal cities, its shrines, etc., afford much interesting reading. The language in which he describes the customs, ceremonies, manners, traits and traditions of the Indian people—shows profound admiration and love for the land which, to use his own words, "had for years become a kind of spiritual mother-country" to him. Price Rs. 14. To Subscribers of the "Indian Review," Rs. 1.

Glimpses of the Orient to-day—By Saint Nihal Singh. In this book, Mr. Singh describes the transition that has taken place in Asia, during the last few decades, traces the causes of the awakening and offers a prophecy as to its ultimate effect. Price, Rs. 1. To Subscribers of the "Indian Review," Rs. 12.

All about Delhi—An Exhaustive hand book compiled from authentic sources. With 35 Illustrations. Rs. 18. To Subscribers, Rs. 14.

Essays in National Idealism—By Ananda K. Coomaraswamy, D. Sc. Popular Edition with 6 Illustrations. Rs. 1. To Subscribers of the "Indian Review," Rs. 12.

The Swadeshi Movement—A Symposium by Representative Indians and Anglo-Indians. An excellent and authoritative collection of official and non-official views. Rs. 1. To Subscribers of the "Indian Review," Rs. 12.

G. A. Natesan & Co., Sankararam Chetty Street, Madras.

TOPICS FROM PERIODICALS.

Islam in Afghanistan.

Under the above heading, Mr. T. L. Pennell, F.R.C.S., gives in the *Moslem World* for February, some highly illuminating particulars about the life and religious beliefs of the Mussalman peoples to the North-west of India. The origin of the Afghans is a mixed one, in which the predominant element is a Turco Iranian one with Semitic commixture, first from Israelitish sources and afterwards from Arabian. With the exception of a few thousand Hindu traders and shop keepers, all the inhabitants of Afghanistan and all the Afghan tribes in British India and in independent territory are Mahomedans to a man. Islam is the state religion, the law is the law of Islam, and the people vie with their rulers in their zeal for their faith.

Coming to the Pathan tribes, they are the most fanatical followers of Islam on earth. Their religious ignorance is on a par with their fanaticism. Some of the more mountainous tribes have receded even further into barbarism, and are so ignorant of Islam that they neglect prayers and fasting, and do not even circumcise their children. The Provindabs, the familiar Afghan traders in India, are the most punctilious observers of the outward law of Islam. The worship of saints, tombs, and relics, especially in the wilder tribes, occupies an important place in their daily life. The following incident illustrates most humourously the blind nature of their worship.

Some Afridis were, according to their wont, ambushed near a frequented highway, waiting for some unwary traveller to fall into their grasp. As chance would have it, a rich and portly Syed (holy man) was the first to come that way. They pounced upon him; he protested that they had made a mistake, that he was no blaspheming Hindu but a descendant of their own Prophet, a holy man whose prayers were sought by small and great, for did not all know that his prayers were admitted at once to the divine presence. "Now," said the unabashed bandits, "we are, indeed, in good fortune, for have we not long said that the only thing needed for our mountain is the grave of a genuine holy man, and God has sent him to us." They promptly killed the poor protesting Syed, annexed his goods and money, buried him with relish on the top of their mountain, and now pray regularly at his tomb for any heavenly or mundane benefits they may desire.

Yet when H. M. the Amir visited India, he returned home to found a fully equipped college at Kabul on modern lines. Though hampered by the orthodoxy of his people, it is a sure step to progress. A deplorable feature of the fanaticism of these peoples is the glory which they attach to the murder of non-Mussalmans on religious motives.

For instance, a few years ago, a regiment was marching out of Bannu with several mounted officers riding together at the head; a *ghazi* suddenly dashed out from behind a culvert where he had been hiding, and shot one of the officers, holding his revolver almost against the unfortunate man's chest. He was at once knocked down and bayoneted by the sappers, but he had courted that as a death of glory and a happy entry into Paradise.

The spread of education has done much to efface bigotry among the Pathans. Among the independent tribes the only education imparted is the meagre instructions of the Mullahs all in religious matters. Many hospitals and schools have now greatly attracted Mussalmans from various places, to the gospel of Christ.

India's Daughters.

Miss Vidvavati Seth writing on the above subject in the *Vedic Magazine*, pleads for female education on "national" lines. With the advent of Mussalman rulers various causes were at work to bring down the value and position of Indian women. But now has come a renaissance.

But sad to say that since they have received their training after the Western fashion many of them have become Western in thoughts and ideas—in their way of living and their habits—and though sincerely patriotic in their dealings with their country have not been able to escape from the evils of the West. They have a mania for despising everything old calling it irrational or old-fashioned. Their one aim and end in life seems to be to make India socially a downright Western country, another England or France. To fulfil this end they have found it essential to draw women to their side, which at the outset of their awakening they had thought, perhaps, they could dispense with by replacing them with those of the West. So they have turned their attention more or less towards the women's so-called education, and even have been successful in producing many a lady graduate, doctor, and reformer.

This development should be accompanied with moral worth Indian literature, Indian ideals and Indian manners should be adequately studied,

The Indian Labour Problem.

Mr. M. B. L. Bhargava writes a highly suggestive article on the above subject in the March number of the *Hindustan Review*. He divides labourers into four classes.

First, the common labourers who are mostly landless villagers and forming the lowest rank of unskilled workmen. They are generally good workmen in agriculture of the primitive kind, but this profession has made them lethargic, unenterprising and resigned to their lot owing to there being no gradation of work in field labour. Secondly, the artisan classes, such as carpenters, goldsmiths. The profession in the case of the operatives of this class is mostly determined by caste—once a shoe-maker always a shoe-maker, and it is the inelasticity of the caste system. Though the possession of hereditary skill is more or less ensured, the caste system has the unwholesome effect of making these artisans inactive and unenterprising. They are generally illiterate and averse to change of profession. Thirdly, trained mechanics. This class is of a comparatively recent growth and forms an infinitesimally small portion of the population. Lesser still is the number of those who are suited for practical work in an up-to-date modern factory. In spite of their fewness the rate of salary in this class of workmen is much smaller than in the case of their European rivals, first, because the standard of their life which mostly determines the rate of wages, is lower, and then they are not sufficiently patronised by Indian capitalists. Fourthly, the business managers and assistants. This class is yet to be created in India. Our concerns are mostly managed by amateur lawyers, zemindars and retired Government servants who are totally ignorant of the ways of conducting a modern business, and this is one reason why most of the Indian concerns prove unsuccessful in the end.

The absence of universal Primary Education in India is an obstacle in the path of getting efficient labour. In the masses and the classes the keen spirit of self-improvement is also absent. While on the one hand the absence of plenty of Indian workmen of higher qualifications necessitates the expensive employment of Europeans, young Indians who have been educated in foreign lands do not receive encouragement from capitalists. Business managers and assistants are best educated in the practical concerns themselves. Promising boys should be early initiated into business and allowed to rise gradually.

The education of labourers will result in another good, viz., it will produce a most decided improvement in the moral character of the workmen. If workmen are dishonest, the loss which is incurred is considerable as they must be superintended and watched and thus their labour is rendered less productive because a portion of the wealth has to be paid to supervisors.

Also the principle of division of labour should be adequately utilised. Among the causes that keep the rate of wages in India at a low rate is the immobility of Indian labour.

Another cause of the lowness of wages is the increase of population in India. In an agricultural country like India increase of population means recourse to worse land for cultivation and lesser produce of articles of necessity. This makes the agricultural classes poorer, lowers the standard of their living and finally reduces the rate of their wages.

Many remedies for the bettering of the condition of the labouring classes in India have been and are suggested from time to time. It has, for instance, been pointed out that wages should be raised by a statute. This can only have a baneful effect on Indian industries as the raising of wages by a Government enactment will result in lesser employment of capital. But there are some other agencies for securing a permanent advance in the condition of labourers. Improvements in the means of communication which leads to increased facilities for migration of labour is one of them.

The usefulness of trade unions should also be noted. They will not only serve as friendly societies but also will prove powerful in enforcing various regulations on masters and workmen.

The Qualities of Leadership

In the course of an Article on "Leadership" the "British Medical Journal" observes:—

It is not an easy thing to decide as to the qualities which fit a man for leadership. He must be tried, and too many thus tried would come under the verdict of Tacitus *Capax imperii non imperasset*. The foremost man of a revolution may be the right person to lead his enthusiastic followers to victory, but he may not be the one to keep them together afterward.

We may remark that the greatest revolution in the history of mankind was made without a leader. The mediocrity of the men who brought about the French Revolution and led the people during that period of storm till Napoleon ended it with his whiff of grapeshot has often been the subject of comment. Robespierre was a pedantic mediocrity who ruled men by high-sounding phrases taken from Rousseau. He is an extraordinary instance of how a man of small intellect can impose himself by a glibness of tongue and a talent for intrigue disguised under the aspect of an austere integrity. The born leader of men knows how to wait, and how to bring his individuality to bear at the right moment, he knows, too, when to retire.

The writer concludes—

Whether Wellington did or did not say that Waterloo was won in the playing fields of Eton, there can be no doubt that the qualities which go to the making of a leader in sports are the same as those which help to make a man a leader in war or in politics.

Education in Ancient India.

Mr. L. Shanker Jha gives an excellent description of "Education in Ancient India" in the March issue of "*Indian Education*." As the philosophical ideals of the people are closely connected with its system of education the following thoughts were predominant in Ancient India:—

1. *Belief in the theory of caste*, and the division of labour thus involved. The son, as a matter of course, followed the profession of his father and consequently only a Brahman could be a teacher.
2. *Belief in Punarjanna*, i.e., transmigration of soul and the consequent belief in 'Sanchit Karma' or inherited knowledge.
3. *Idealism in Philosophy* preaching that this world is a mirage, and the senses are not the true gateways of knowledge. Consequently self-intuition is the best means of getting the truth. "Look within for everything," was the favourite precept.
4. *Disbelief in human nature*. Our feelings and desires are sources of evil and they should be checked as far as possible.

The importance given to religious life was conducive to good character. The education given was modified according to caste. The Sudra was provided with no system at all. As the pupils were mostly Brahmin and hence willing, there was not much need for a pedagogical science.

The characteristics of Aryan Pedagogy are as follows. There was nothing in their beliefs which could stimulate the teacher to think of teaching and hence we find very few books on the subject. The training of the senses received no thought, rather it was discouraged and hence the material sciences got little development. Subjects that can be learnt by self-intuition received the chief care and there was an enormous development in sciences related to them. Disbelief in human nature led to asceticism being taken as the ideal of life and Education was meant to prepare men for life after death rather than for this life, and utilitarian subjects were neglected. Character and knowledge of the Vedas were the most important considerations. Method of teaching was chiefly deductive. For want of printed books those giving authoritative knowledge were learnt by heart and thus memory got undue development.

There is given the life of the student and the Gurur. As regards the method of instruction, self-effort was emphasised. The article has a wise conclusion.

We must remember, however, that the system, at its best, was meant for the few, for a privileged class only, that the mass of the people cannot be educated that way. In those days the struggle for life was not keen, men could live on little, and for the maintenance of Brahmins ample provision had been made by the society. In these days India has come into competition

with the industrial life of the whole world and the question of bread has become uncomfortably prominent and will become still more so in the near future. Can we or should we still insist on a purely humanistic Education and the method of introspection? Intellectual idealism may be a grand thing, but one must have a little bread also. The cry for technical and industrial Education which is being heard so persistently shows that the need is being keenly felt. By all means let us preserve or reintroduce all that is grand and noble in our old system, its postponement of marriage till the 'Grahasthasram' is entered, its anxiety to prevent many of the school boy evils, its hardening process, its relationship between the teacher and his pupils, and above all the self-sacrificing spirit of the teacher. But the history of Education in India and Europe teaches us many lessons and it should not be necessary to have to learn these lessons over again by bitter experience.

Chaitanya.

In the *Theosophist* for April is a short sketch of "Chaitanya, the Prophet of Bengal," by Mr. P. Narayana Sinha. The prophet's birth had been foreseen by sages. Going to Gaya to offer *pinda* to his deceased father, "he met Isvara Puri and begged that ascetic to initiate him in the *mantra* of Sri Krishna. He got the *mantra* and recited it in deep meditation. He keenly felt the absence of Krishna and pitiuously wept to find Him out." Bidden by a voice from the heavens he went back to Nadiya, and received divine blessing on his way. In the village he organised a Sankirtana party and proclaimed the name of Krishna from house to house. Sometime after he became a Sanyasin and went to Jagannath. He made a tour through South India. He always evinced an intense sense of the presence or absence of the Lord Krishna, not explicable in the ordinary order of things.

Chaitanya believed in both the Saguna and Nirguna aspect of Brahman and found the potentialities of Saguna in the Sat, Chit and Ananda aspects of Brahman. These aspects are Sakti, which give rise to manifestation. Chaitanya made a distinction between Sakti and Maya. Maya, he said, was illustrated in our identifying the Self with the body. But he emphasised the truth that neither Isvara nor Jiva was born of Maya. Jiva is a part of Isvara and the chief mission of Jiva should be to serve Isvara. One who does not believe in the Sakti of Brahman takes only an incomplete view. "Vyasa," said Chaitanya, "has told the truth in the Vedanta Sūtras. The Sūtras are in perfect accord with the Upanishads. Sankara Acharya has by the sidelight of his commentaries eclipsed the direct meaning of the text. The Acharya is not in fault. He had a command from Isvara to do so."

Sympathy and Self Government.

A writer in *East and West* for March pleads for greater sympathy between the rulers and the ruled in India. With Lord Morley, sympathy means not only politeness and good manners but knowledge and comprehension of the ideals and traditions of the people concerned. Most Englishmen in India do not realise their responsibility and are seldom cautious in their relations with Indians. They are ignorant of the great disservice they are doing the Empire by their disagreeable behaviour in social life. What is merely the freak of an individual or two is generally mistaken for a deep-rooted racial animosity. The supine indifference of the Englishman to his Indian fellow citizens and the air of superiority with which he moves about in India are the results of a thoughtless but pardonable vanity. But their import is exaggerated in India. The Government is often associated with Englishmen and the arrogant freaks of a few of the latter are mistaken for the decided policy of the former. To remedy the evils arising from this want of sympathy the writer suggests the following observations:—

If there is perfect equality in the number of Indian and English officers of the Civil and Imperial services in India, then, I think, the aims and aspirations of educated India will be satisfied, and the Government of India, so constituted, will work more smoothly than it ever did before. What I mean is, that to every Englishman holding a high administrative post there should also be an Indian holding a similar appointment. Some of our kind friends in the Anglo-Indian Press may come forward with the objection that there are not enough capable Indians to take up such posts. Though this objection may be frivolous, yet superficially there seems to be some truth in the statement. The fact is that there are enough capable and eminent men available, but owing to disabilities which are easily removable, they are obliged to remain in the background. The difficulty may be overcome in this way. The Secretary of State for India should authorise the Civil Service Commissioners to select an equal number of English and Indian candidates for service in India, while the Government of India should be instructed to send to England a proportionately large number of young Indian graduates of approved merit from the various provinces of India to compete for places in the Civil Service examinations. The cost of this could, of course, be borne by the Indian Government, and nobody would grudge it, since it accords with the proverb "Charity begins at home," and the sons of the soil would be trained to administer their own country.

The History of India and its Study.

The second and concluding essay on "The History of India and its Study" by Sister Nivedita, the first having been noticed in this Review last month, appears in the April issue of the *Modern Review*. She lays stress on travelling as a means of building up history. Scholars might choose particular episodes for their field of works.

But one of the master facts in Indian history, a fact borne in upon us more deeply with every hour of study, is that India is and always has been a synthesis. No amount of analysis, racial, lingual or territorial, will ever amount in the sum to the study of India. Perhaps the axioms of Euclid are not axioms after all. Perhaps all the parts of a whole are not equal to the whole. At any rate apart from and above all the fragments which must be added together to make India, we have to recognise India herself, all-containing, all dominating, moulding and shaping the destinies and the very nature of the elements out of which she is composed.

We should not be discouraged by proofs that some cherished idea of ours is of foreign origin. This theory of origin is really of no importance. In the matter of fixed dates of our antiquity the student ought not to be led away by sentiment.

A long childhood, say the biologists, is the greatest proof of evolutionary advancement. Egypt, with her exceptional climate, made art and architecture the supreme expression of her national existence. India put her powers, perhaps a long ago, into the dreams and philosophy of the Upanishads.

The sociological habit is essential also if we would be in a position to gauge the relations of India to the incursions from beyond her border. Few people know that in the beginnings of human society woman was the head of the family, and not man. The history of common things and their influence on our customs is a study that follows naturally on that of human society.

Thus the mind comes to live in the historic atmosphere. It becomes ready to learn for itself from what it sees about it, at home and on a journey. The search for stern truth is the best fruit of the best scientific training. But the truth is not necessarily melancholy, and Indian students will do most to help the growth of knowledge if they begin with the robust conviction that in the long tale of this Motherland there can be nothing to cause them anything but pride and reverence. What is truly interpreted cannot but redound to the vindication and encouragement of India and the Indian people.

The Currency Revolution in India

In the course of an elaborate article on the Currency revolution the *Statist* writes as follows:—

As the matter looks to us it is inevitable that if the revolution in China is carried out, and if European ideas are acted upon, as they are being acted upon in Japan, an immense amount of silver will be required by China, assuming that she adopts a silver currency and does not go at one jump right away to gold. But while he is exceedingly weak when dealing with a future of possibly many years, he does put forward an apparently strong argument when he objects that the coined rupee is of very much higher value than the uncoined silver, and that, therefore, the prudent Indian will not melt down rupees and sell them at a serious loss.

Germany in the early seventies had called in her silver money, melted it down, and sold it at a serious loss. Now what has happened in Germany may very likely happen again in India. It is not a necessary conclusion however; but there is nothing to check the probability of a repetition in the East. Within the life-time of the writer, nay, even within his recollection, he has found that the loss upon the sale of German silver was so heavy that before the process was quite completed, the German Government got tired of selling and to this day the whole of the *thaler* pieces have not been disposed of. It may be argued that the Germans are not quite as capable as the Indians in matters of business. But Germany, since the war with France has proved herself most capable of business and will not take its loss lightly for an attractive policy. What is there to prevent India from adopting a course which she thinks would be conducive to her interest?

India has entered upon a great revolution. Quite recently our own Government granted greatly extended powers to the Indian Councils, both Viceroyal and Provincial. It gave them the right to discuss all matters of public interest, and it constituted the non-official members a majority. For the first time, then, in the history of India we have Legislative Assemblies in that country the majority of which represent the native Indian population, and have the right to discuss every question of public interest from the highest to the lowest foreign, domestic, political, commercial, moral, educational, and religious. There is no question that can be thought of which it is not within the province of the Councils to discuss, and to come to decisions which they

are free to press upon their Government. India no longer, therefore, is in the position that the Government decides what her money is to be, and carries out the decision without reference to the likes or dislikes of the people. The Indian people now have the right to say what their laws and customs and institutions of every kind shall be, and we may depend upon it they will take care to exercise the right.

It is significant that India is importing sovereigns in such large amounts. Last year the imports exceeded 20 million sterling or one-fifth of the whole annual production of the world. It won't, of course, recur annually. But then if the crop is good in India there will be a greater import of gold. There is also another nightmare in the rise of China. The attitude of China and the relation between gold and silver will eventually change.

If the revolution in China is real, and if China is to follow the example set by Japan, and to introduce Western methods of business in all departments, then the need of China for silver will be very large, and it is quite possible we may see a marked rise in the price of silver measured in gold. At all events, when we consider that the population of China numbers, in round figures, about 400 millions, and that the population of India numbers about 315 millions, we have in the two great States, roughly, about 700 millions of people, or not far short of half the whole population of the earth. India has already become so rich that her well-to-do classes must upon having a gold currency. China is about to enter upon a career which promises, if it is not nipped in the bud, to lead to marvellous results. Therefore we, for one, shall not be surprised if there is a great change in the relative values of the two principal precious metals. Neither shall we be surprised if Indian public opinion, expressed in the Legislative Council, will urge upon the Government measures that at present look exceedingly unlikely.

INDIAN MILITARY EXPENDITURE.—An Exhaustive and Comprehensive treatment of the question. Full of facts and figures by Mr. Dinshaw Edulji Wacha, Crown 8vo. 51 pages, As. 4.

RECENT INDIAN FINANCE.—By Mr. Dinshaw Edulji Wacha. A valuable collection of papers relating to Indian Finance dealing with such subjects as, The Case for Indian Reform; The Growth of Expenditure; Enhanced Taxation; Revenue and Expenditure; Reasons for the Deficit, etc. Price As. 4.

INDIAN RAILWAY FINANCE.—By Dinshaw Edulji Wacha. Price As. 1.

DINSHAW EDULJI WACHA.—An account of his life and career, his services to the Congress movement and copious extracts from his speeches and writings relating among other subjects to all the important questions of Indian economy and finance. Price As. 1.

Maritime Activity in Ancient India

In the *Dawn Magazine* for March, Mr. H. C. Chaklader gives parts of the interesting accounts of Marco Polo showing the existence of maritime intercourse between India and China in the 13th century. Marco Polo speaks of many having come to the port of Layton in China, from Upper India to be tattooed. Of Fuju, another Chinese port, he says:—

There flows through the middle of this city a great river, which is about a mile in width. There is a great traffic in pearls and precious stones. For many ships of India come to these parts bringing many merchants who traffic about the isles of the Indies. For this city is, as I must tell you, in the vicinity of the ocean port of Zayton, which is greatly frequented by the ships of India with their cargoes of various merchandize, and from Zayton ships come this way right up to the city of Fuju by the river I have told you of, and it is in this way that the precious wares of India come hither.

Of still another port he says —

The ocean sea comes within 25 miles of the city of Kinsay at a place called Ganfu, where there is a town and an excellent haven with a vast amount of shipping which is engaged in the traffic to and from India and other foreign parts, exporting and importing many kinds of wares, by which the city benefits. He also adds about this town of Kinsay "At the back of the market-places, there runs a very large canal on the bank of which are built great houses of stone, in which the merchants from India and other foreign parts store their wares, to be handy for the markets.

Marco Polo also gives accounts of many Indian ports:

Of the great port of Cal in Malabar, Marco Polo writes "Cal is a great and noble city. It is at this city that all the ships touch that come from the West, as from Hormes, and from Kis, and from Aden, and all Arabia, laden with horses and with other things for sale.

The paper concludes with Marco Polo's high testimony to the character of Brahmin merchants,

You must know that these *Abramman* (Polo's corruption for *Brahman*) are the best merchants in the world, and the most truthful, for they would not tell a lie for anything on earth. If a foreign merchant who does not know the ways of the country applies to them and entrusts his goods to them, they will take charge of these and sell them in the most legal manner, seeking zealously the profit of the foreigner and asking no commission except what he pleases to bestow. They eat no flesh, and drink no wine, and live a life of great chastity. Nor would they on any account take what belongs to another, so their law commands. And they are all distinguished by wearing a thread of cotton over one shoulder and tied under the other arm, so that it crosses the breast and the back.

The Growing Power of the King.

A writer in the *World's Work* for March discusses the growing power of the King. He says that the Indian journey has added considerably to the King's status. It was the King's own wish, his own choice and his own doing; and his admirable conduct in the course of this important tour has enhanced his prestige. "The King," says the writer, "is the most characteristic Englishman who ever sat upon our throne."

His intelligence is highly objective, so that facts impress him more than theories, and actions more than principles. Yet, below the surface, is a deep vein of imagination and enthusiasm. His opinions and practice in the sphere of morals are what the enlightened continental would condemn as painfully narrow. His praise is for achievements, his enthusiasms are for achievements yet to be.

The King again is a typical Christian. A story is told that he once retired early to bed one Saturday night at a country-house because he liked to have a little time to prepare himself for the Holy Communion. "It is one thing to be 'Defender of the Faith'; and it is another thing to take that faith so seriously."

Well, but what is such a king destined to make of the British Monarchy?

The writer declares —

Of all the features of our public life at this moment there is none more remarkable than the growing allocation of the political parties from the people.

Whatever things are pure, whatever things are holy, whatever things are noble and generous and wholesome, tend to fall outside the bounds of party feeling. Here it is that the monarchy can lead the nation.

In every respect the minds of Englishmen are prepared for rapid and decisive changes, and for a succession of momentous events. There is a weakening of the sense of national continuity.

Here the monarchy has something approaching to a manifest destiny. It is a visible symbol of national unity through all changes, and an enduring chain of connection between the national past and the national future. "Constitutional" restraints only heighten the importance of the monarchy in this respect.

KING GEORGE'S SPEECHES ON INDIAN AFFAIRS—Part I. A complete collection of all the speeches made by His Majesty during his tour in India as Prince of Wales. Part II. Full text of all the speeches delivered by His Majesty during the Coronation Durbar Tour. Price One Rupee. To Subscribers, As. 12.

Swami Vivekananda.

Mr. R. N. Bandyopadhyaya, writing on the above subject in *Prabuddha Bharata* for February and March, gives a short account of the teachings of the Swami. He taught the divine origin of man and so infused into him a healthy spirit to work for his salvation.

It was Vivekananda who, by presenting before our eyes the serene effulgence of the gems of Vedanta, dispelled the scorching glamour of Western civilisation. With what lion's strength he has called upon us to hold fast to Vairagiam (Renunciation) as the highest ideal of our religion. He says, "Vairagiam or Renunciation is the very beginning of religion. How can religion or morality begin without renunciation itself? 'Give up,' says the Vedas. 'Give up!' Through renunciation alone immortality is reached. Renunciation, that is the flag, the banner of India, floating over the world, the one undying thought which India sends again and again as a warning to dying races, as a warning to all tyranny, as a warning to all wickedness in the world. Aye, Hindus, let not your hold of that banner go. Hold it aloft. Even if you are weak, and cannot renounce, do not lower the ideal."

His greatest achievement was his bringing home to the Occident the greatness of Hinduism.

"The Swami standing before the Parliament of Religions at Chicago and carrying the vast audience with him, by his magnetic personality, eloquence and marvellous exposition of Hinduism, reminds us of Sankaracharya. Prior to that the interested Christian missionaries and the prejudiced Western historians were the only source of information on Indian subjects in the West, and the former spared no opportunity to pour forth the vials of slander upon the devoted head of poor India, and felt no scruples to paint her in the blackest colours. Their garbled delineation of Indian institutions represented Hinduism as a string of nonsensical mummeries associated with a number of hideous idols. It was the mission of Swami Vivekananda not only to stamp out this wrong notion from the Western mind, but also to promulgate the true message of Hinduism to the world. He has shown that the Hindu civilisation is pre-eminently spiritual, that in spite of the Westerner's marvellous achievements on the material plane he is yet to be initiated into the mysteries of the spiritual domain by the Aryan Sages."

The Swami's gospel was one of love and sympathy. His heart was set on ameliorating the state of the down-trodden millions in India. He was also a patriot.

The material and social needs of India did not escape the attention of Swami Vivekananda. Suffice it to say here that no Indian problem has been left untouched by the all-embracing genius of Vivekananda. He has dealt with these problems with the insight of a Yogi, and laid down the most eminently practical plans and effective remedies which, if adopted, are sure to expedite the salvation of the country.

Swami Vivekananda had a special message to Young India. In conclusion:—

At a time when a blind pursuit after Western civilisation was threatening our national life and national religion with dissolution, we had by the divine dispensation of Providence, Bhagawan Sri Ramakrishna and his messenger, Swami Vivekananda. The greatness of Hinduism has once more been vindicated, the eternal truths of the Vedanta have once more been verified in the life of Sri Ramakrishna and Swami Vivekananda.

The University of Nalanda.

The *Dacca Review* is publishing a series of articles on the University of Nalanda and its influence on Oriental thought. From the sixth to the eighth century, for nearly some 200 years, this great Buddhistic seat of learning remained at the zenith of its fame. In spite of the difficulties of communication and dangers of travel in those days the University still exercised a profound influence over the thought of the East. Young men, mostly monks flocked to it in large numbers from the various parts of the country. The pandits of this University were the most famous in all India both for depth of learning and sanctity of character. Chinese and Tibetan thought alike were affected by the great institution. Early in the seventh century a band of seventeen scholars came to India with the permission of the King of Tibet. They succeeded in reaching Southern India and learned the alphabets of the South Indian literature. The leader of the mission, Themi Sambhota, then betook himself to Nalanda and underwent a complete course of study. On his return to Tibet, he established a school in his native country after the model of the great University and invited scholars from India to lecture in his new academy. Thus the intellectual kinship of the two countries became closer: and the fame of Nalanda spread to China also after the advent of Hsuen Tsang and other eminent savants from

Swami Vivekananda.

Mr. R. N. Bandyopadhyaya, writing on the above subject in *Prabuddha Bharata* for February and March, gives a short account of the teachings of the Swami. He taught the divine origin of man and so infused into him a healthy spirit to work for his salvation.

Early in the seventh century a band of seventeen scholars came to India with the permission of the King of Tibet. They succeeded in reaching Southern India and learned the alphabets of the South Indian literature. The leader of the mission, Thonmi Sambhota, then betook himself to Nalanda and underwent a complete course of study. On his return to Tibet, he established a school in his native country after the model of the great University and invited scholars from India to lecture in his new academy. Thus the intellectual kinship of the two countries became closer: and the fame of Nalanda spread to China also after the advent of Hiouen Tsiang and other eminent savants from Cathay.

Economic Developments of India.

Sir Theodore Morison contributes an interesting paper on "Some Recent Economic Developments of India" to the March number of *The Empire Review*. In the course of his excellent survey of Indian industries, he draws attention to the transformation that has taken place in the economic structure of modern India. The old rural crafts have given way to the improved methods of manufacture. Manchester and Birmingham are becoming the model of the centres of Indian industries. India will before long supply her own needs and refuse to have her demands imported from foreign countries.

My forecast, then, of the economic future of India is that the young men, trained in Government schools and colleges will found factories employ workmen and direct industries upon modern lines, and that these capitalist industries will gradually supplant the petty craftsmen who have until a recent date supplied the daily needs of the Indian people.

But if India makes for herself all the things which England is exporting to her to day, will it not affect the commercial interests of Englishmen? Sir Theodore has no fear on that head. He observes—

As against that loss, however, we may put the consideration that the industrial revolution will certainly bring an immense increase in the wealth of India, and therefore an immense increase in her purchasing capacity. She will not take so many of the cheaper goods which we now send her, but she will certainly want many of the dearer articles which she cannot at present afford. On the whole, I am inclined to think that though there may be a change in the quality of the trade, a rich India will prove a better customer than a poor India. France, Germany and the United States are among the host of England's customers, in spite of the fact that they are industrially well-organized, and are further protected by tariff walls, and as for head of population those countries take more of our goods than India does, so it seems to me probable that India, when industrially developed, will be a better customer than she has been yet.

But these speculations are remote possibilities. We shall look to the immediate effect. India has to purchase the requisite machinery for manufacture from abroad. Now, in order to make India utilise English capital and English machinery, she must receive her industrial training in England. The policy of excluding Indians from English business concerns is short sighted and suicidal.

Islam and European Christianity.

In the February number of the *Muslim Review*, the place of honour is given to an article on "Islam and European Christianity" by Mr. S M Rauf Ali. It is an elaborate and rigorous defence of the ethics of Islam from the scandalous misinterpretations of some Western savants. Dealing with Christianity as it is understood and accepted in the West, the writer says:—

It is in transforming the Christianity of Jerusalem into the Christianity of Europe that the modern civilization, having Christianity as its basis, is found wanting and has been unable to fulfil the mission of goodwill on earth, and therefore cannot appeal to any sober-minded oriental.

But there are detractors of Islam who charge it with fanatical deeds of individuals, barbaric methods of persecuting the infidels, low morals and semi-savage ideals. Mr. Rauf Ali denies that there is any truth in the imputation. Then follow several citations from the Qur'an forbidding conversion by compulsion. But the civilizing influence of the religion of the great Arabian prophet is graphically told. Unlike Christianity, Islam affords equality of treatment for all the faithful without distinction of race or colour.

As soon as an African Negro embraces Islam, he finds that he is treated on an equal footing with the best and the highest of his co-religionists, and no artificial barriers of inferiority of race or colour are put in his way. This equality of treatment naturally produces in him a keen sense of self-respect, which is the foundation of all character and morals. The whole atmosphere of Islam has a civilizing influence over his mode of thought and conduct. He begins to consider himself a responsible being, and, for the first time in his life, becomes conscious of the eternal truth that in the eyes of the Master all men are equal. Then, the spontaneous zeal of a new convert characterizes his dealings with piety, and religious fervour makes him a determined and virtuous man. In a word, as soon as he sincerely utters the Muslim creed, he turns from the barbarian African into a Muslim gentleman, conscious of his duties towards God, his parents, children, wife, friends, and fellow-beings. A new era begins in his life, which opens up vistas of material advancement in this world and eternal bliss in the world to come. His career becomes full of hope and promise, and the endeavour to make his life beautiful before God and men realize in him the ideal of perfect manhood. *Altaf* he becomes the centre of light for others who are yet in darkness and are groping their way to salvation. He sets about the work of ameliorating the condition of his people in right earnest, he makes it the one goal of his whole life.

QUESTIONS OF IMPORTANCE.

Indian Education.

Purposes of the Imperial Grant.

Unlike the announcement of the transfer of the Indian capital and the reconstitution of the Bengal Provinces, the intimation of an increased grant of 50 lakhs of rupees (£333,333) for 'the promotion of truly popular education' was in accord with widespread expectation, having regard to the awakening of Indian public opinion in recent years to the importance of the problem of educational advancement among the masses. The announcement of Lord Hardings on behalf of the King-Emperor embodied a definite statement of policy, since it not only acknowledged the predominant claims of educational advancement on the resources of the Indian Empire, but declared the intention of Government 'to set themselves to making education in India as accessible and wide as possible.' The present recurring grant is to be added to in future years 'on a generous scale.'

RECENT EDUCATIONAL PROGRESS.

The increase of educational expenditure is in itself nothing new; it is rather the application of the grant which constitutes a fresh departure. The expenditure on public instruction, which stood at about 2½ million pounds from all sources ten years ago, was considerably developed by Lord Curzon's Government, which made an annual assignment of 40 lakhs (£266,666) in 1902, and followed this up by further additional subventions during its years of financial prosperity, while the local Governments supplemented these grants from their own resources. This progressive policy has since been maintained as the financial circumstances of the country have permitted, until in the year ended March 31st last the total educational expenditure stood at over £1,588,000, thus having been nearly doubled in the course of a single decade. It should be noticed, however, that, in accordance with what has far too long been the stereotyped policy of Government, under the pressure of articulate Indian opinion, the lion's share of the increase has been absorbed by higher and secondary education, instead of being devoted to wider diffusion of instruction among the masses. In the ten years since 1900-01 the number of pupils in colleges, secondary schools, special schools, and private advanced schools has risen from rather less than 700,000 to 1,089,000. In

the same period the number receiving instruction in primary and private elementary schools rose from 3,710,000 to 5,122,000. Of the total number of male scholars in the country 18 per cent., and of female scholars 12 per cent., were undergoing higher instruction.

RELATIVE EXPENDITURE.

Yet these comparatively small percentages of pupils receiving secondary and higher education absorb the greater part of the educational expenditure. The average annual cost of each pupil at arts colleges in 1909-10 was £11-17s. 8½d.; at colleges for professional training it was £21-16s; and at secondary schools it was rather more than 30s, while at primary schools it was under 5s 9d. As there are more than five million scholars in the primary institutions, this low figure of cost reduces the average outlay upon each pupil under instruction in all Indian institutions to about 11s 11d. Of the small total cost of each primary scholar no less than 2s. 4½d., or two-fifths, is met from fees or 'other sources' (of small account) not involving charge upon public or municipal revenues. But cheap as primary education in India is, compared with Western standards, it leaves untouched the greater majority of the population. On the basis of 15 per cent. of the Indian population being of school-going age, the proportion under instruction is 30 per cent in the case of boys and 5 per cent. in that of girls.

NECESSARY IMPROVEMENTS.

These figures bear convincing testimony to the great distance India must travel before the ideal of free, primary and compulsory education is attainable. Even the grant of half a crore of rupees announced at Delhi cannot be followed by an immediate corresponding increase of primary pupils.

Much of the money must be devoted to the erection of new schools, the improvements of those now in use, and better equipment. There are hundreds of thousands of Indian boys and girls living far beyond reasonable reach—say the three-mile limit—of a school. Though in the large towns there are, of course, scores of educational establishments of various grades, each institution in India for males has to serve, on the average, four towns and villages. And for females 41 towns and villages. The most pressing need, however, is for a higher standard of teaching. In the last quinquennial report on Indian education covering the years 1902-7 it is estimated that if the whole of the direct expenditure on

schools at that time were devoted to paying the salaries of teachers; they would receive on an average only about Rs 8 (10s 8d) a month. The provincial reports were unanimous as to the urgent need for improved pay among the primary school masters, both in order to keep up the supply and to attract to the profession a properly qualified set of men. While something has since been done to remedy the condition of affairs, and special attention has been paid to the provision of training schools, the allocation of the whole of the new grant to salaries of teachers would be inadequate to the solution of this problem.

TECHNICAL INSTRUCTION.

But there is another department of 'popular education' outside the teaching of the three R's which it is the intention of the Government of India to help forward with a part of this grant. The higher branches of technical instruction can not appropriately come within the scope of the grant, but it is probable that there will be some allocation of funds to what may best be termed industrial education. Craft schools for the training of artisans were recommended by the Simla Conference more than ten years ago. The underlying idea is to produce artisans who may rise to a distinctly higher standard both of general intelligence and manual skill than can be obtained by the ordinary traditional routine. But though some special schools exist—such as the weaving schools in Bombay and Bengal, the schools of handicrafts at Nagpur, and the mechanical apprentice class at Rurki Engineering College in Upper India—comparatively little has hitherto been done in this direction.

The committee of the Education Fund for Europeans and Eurasians in India, who are now in this country in order to collect funds for their special purpose, are anxious that it should be clearly understood that the new grant towards popular education does not in any way obviate the necessity for subscriptions. Education is the more urgent necessity for the Eurasian the more the educated Indian is in a position to compete with him for employment.—The *Times' Educational Supplement*.

THE INDIANS OF SOUTH AFRICA.—How the Helots within the Empire! How they are Treated, by H. S. L. Polak. This book is the first extended and authoritative description of the Indian Colonists of South Africa, the treatment accorded to them by their European fellow-colonists, and their many grievances. UTTERANCES OF THE DAY.

The Hon. Mr. Gokhale on Advisory Councils.

THE Hon. Mr. Gokhale made the following speech in moving his Resolution on District Advisory Councils in the Viceroy's Council on Tuesday, February 27—

Sir,—I beg to move that 'this Council recommends to the Governor-General in Council that steps should now be taken to bring district administration into closer touch with the people by creating, as far as possible, in every district in the different provinces a district council composed of not more than nine members, whose function should be merely advisory to begin with and whom the collector should ordinarily be bound to consult in all important matters.'

Sir, one of the most important and at the same time one of the most difficult problems connected with the Government of this country is how to liberalise the character of our district administration and bring it into closer association with those who are affected by it. Leaving our local bodies for the time out of account and taking a broad survey, the fabric of our Indian administration may roughly be said to have the district administration for its base, the Provincial Governments and Administrations, in some cases with Executive Councils, in most with Legislative Councils, for the centre, and the Government of India with its Executive and Legislative Councils for the top, the Secretary of State with his Council standing behind all and above all, representing Parliamentary sanction, Parliamentary initiation and Parliamentary control. To put the same thing in another way, Sir, one might say that the immediate responsibilities of day to day administration rest on district officers, while the larger responsibilities of the administration, including the work of guidance and control, as also of initiating policies and developing them, belong to the Provincial and Supreme Governments and to the Secretary of State. Now, Sir, before the reforms of the last five years were introduced, the character of this administration was frankly and almost entirely bureaucratic. I use the term in no offensive sense, but simply to mean that it was administration by officials conducted with the aid of official light, and under merely official control. There was no provision in the whole machinery of administration, from top to bottom, for the direct and responsible representation of what might be called the Indian view of things, if one may speak of such a thing as the Indian view, in spite of our numerous differences among ourselves, at any sort of authority, and there was no responsible association of our people with any portion of the administration. The reforms of the last five years, however, by admitting Indians to the Secretary of State's Council, and to the Executive Councils of the Governor-General and of Provincial Governments have in the first place, provided for the direct and responsible representation of the Indian view at the principal seats of authority. Next, Sir, by enlarging the Councils, room has been found on those bodies for the representation, inadequate and unsatisfactory as it is, of different interests in the country. And lastly and above all, by the expansion of the func-

tions of these Councils and in particular by the power of introducing Resolutions, which has been conferred upon members, we have been enabled to raise discussions on matters of public interest face to face with responsible officials; and this has, on the one hand, given a new sense of responsibility to the critics of the administration, and on the other, it has ensured a proper and careful examination of our suggestions and our grievances at the hands of the Government, such as was not possible or was not deemed necessary before. Of course, we are yet a far way from having a real effective voice in the administration, leave alone the question of exercising a direct control over it; but what the recent reforms have achieved is that they have started a system, which tends more and more to substitute an administration conducted in the light of day, and under the eye of public criticism, for an administration conducted in the dark, and this undoubtedly is a great step in advance. So far, therefore, as the centre and the top are concerned, the administration may now be said to be considerably liberalised, and we must all recognise that the fullest possibilities of these changes will have to be worked up to before the necessary momentum is gathered for a further advance. Our district administration, however, continues to be where it was, not only five years ago, but, if we leave out of account the small measure of local self-government given by Lord Ripon, it continues to be where it was more than a hundred years ago. It is true that the position of the collector—and I use the word 'Collector' to represent the head of the district, though in non-regulation provinces that term is not used—has been considerably modified as regards his relations with other officials during the last hundred years and more, firstly by the creation of commissionerships, (that institution is itself three-quarters of a century old); secondly, by the multiplication of central departments; and thirdly, by the gradual evolution of a uniformity of administration which has rendered strong Secretariat control both necessary and possible. But while the old position of the collector in relation to other officials has thus been considerably modified, so far as the people are concerned, there has been no improvement in the situation: if anything, the position has grown worse. This fact was freely admitted by witnesses after witness before the Decentralisation Commission, and those who appointed the commission were themselves fully alive to it, because one important object of the enquiry was stated by them to be how the district administration could be brought into closer touch with the people. There is no doubt that the present position of the Collector, so far as the people are concerned, is, in one sense, much weaker than it used to be. In the first place, owing to excessive Secretariat control he is unable any longer to grant redress on the spot. Secondly, owing to the multiplication of numerous central departments, harassing departmental delays have become inevitable in the disposal of matters, which, properly speaking, in the interests of the people, should be disposed of on the spot under the authority of the Collector. Thirdly, owing to the spread of English education in the country and other causes, there is not the same mastery of Indian languages now attempted by collectors that they used to acquire before. Fourthly, the writing work of the collector has increased enormously; he is thus tied largely to his desk, and therefore unable to acquire the same acquaintance with the requirements of the people that his predecessors were able to acquire. And, lastly, his back has been stiffened by

the growth of political agitation in the country, and he has been, so to say, driven more within himself. All these factors have tended to affect his position for the worse, so far as administering the district in the interests of the people is concerned. The Decentralisation Commission, which freely admits the existence of these defects, and which was appointed to suggest a remedy, was, unfortunately, so constituted that its eye was fixed more on official remedies than on non-official remedies. There was only one Indian member on it and he too was an ex-official. But he was one of our foremost men and he was in favour of the proposal which I have laid before the Council to-day. All the members, with the exception of two, belonged to the Indian Civil Service, and the two outsiders had no knowledge of the country. The Commission, therefore, started with what I would call an official bias, and it did not seriously enquire into those remedies which may be called non-official remedies for the state of things which I have already described. The Commission suggested a large measure of delegation of powers from higher authorities to the Collector—an official remedy, pure and simple. However, as the mischief is admitted by everybody, the Council will recognise that it is desirable that the question should be examined from every standpoint, and any non-official remedies that can be suggested, fully discussed. And it is because, Sir, I think that the proposal, contained in my resolution, is such a remedy, a remedy which seeks to associate non-officials with the work of administration, that I have brought forward the matter before the Council to-day.

Sir, there are those who regret that the old order has passed away, that the old autocracy of the Collector is no longer possible. It is significant, however, that some official witnesses themselves do not share this regret and recognise frankly that the past cannot be recalled. The past really never returns, and in this matter, even if the past could return, I think it would not be desirable that it should return, for things are not where they were a century or even half a century ago. There is a new element introduced into the situation by the growth of an educated class in the country—an educated class that is entirely the creation of British rule. Now, by the educated class, I do not merely mean what many of the witnesses before the Commission meant, namely, lawyers and other members of the learned professions. Sir, it is a pity that so many officials adopt an attitude of sneering, particularly towards lawyers. Such an attitude, for one thing is singularly inappropriate from the representatives in this country of a nation which has at the present moment for its Prime Minister, for its Chancellor of the Exchequer and for its Minister for War, three lawyers in England. Sir, however much some officials may sneer at the lawyer element in India, the non-official public will always recognise, and I can make this acknowledgement with the less hesitation because I am no lawyer myself—that we owe a debt of gratitude to the lawyers for the manner in which they have built up the public life of this country. But though our lawyers are still our most independent element in public life, they are not the only persons who come under the category of the educated class. It is not only the lawyers or the school-masters or the editors that constitute that class; the educated men of the land-owning or mercantile class are also included in the description; men like my Hon. friend Sir Gangadhar Chitambar, who sits behind me, or my friend Sir Y. das Thackeray, who sits on my left—surely

these gentlemen, who have come under the influence of Western education in the same way as others, are as much included in the educated class as any others. It may be that the special peculiarities of their position impose special restrictions on the way they express themselves. That is another thing. But we know for a fact that they hold more or less the same views as other members of the educated class. It cannot indeed be otherwise. Now, Sir, it is a matter of regret that the attitude of many official witnesses towards the educated class should be what one finds it in the evidence given before the Decentralisation Commission. It is true that was four years ago, when the atmosphere in the country was considerably heated, and one should not recall those things more than can be helped in these days, when the sky is clearer and the atmosphere cooler. However, as this is a matter of some importance, I deem it necessary to make one or two observations before I leave it. Sir, there is no doubt whatsoever that the incessant criticism to which some members of the educated class subject the administration of the country, often tries the temper and exhausts the patience of the official class—especially when that criticism is ill-informed, as it sometimes is, and takes the form of an indiscriminate denunciation of the official class. But when expressions of impatience and annoyance are used towards the educated class or ebullitions of temper are permitted in official documents intended for publication, all I can say is that such a thing serves no good purpose whatever. Of course there are things to which an exaggerated importance must not be attached, but the plain fact has got to be recognised that more impatience on the official side cannot now abolish the educated class, just as indiscriminate attacks by non-officials cannot abolish the official class. The fact of the matter is that the two sides have got to get on together in this country for the good of the country, and it is to be hoped now that the atmosphere has been largely cleared, thanks, among other things, to the King-Emperor's visit, and under the new influences, that one feels on all sides that there will be less and less of this impatience on the one side and of indiscriminate denunciation on the other. Well, Sir, I was saying that the growth of this educated class introduces a new element into the situation which makes a return to the old autocracy of the Collector now absolutely impossible. You have got to give an interest to this class in the administration of the country. It is not enough now that the administration should be carried on efficiently and honestly by the officials, it is further necessary that representative Indians of education and position should be associated with the administration. These men have grown up with ideas about Government different from those with which their forefathers were brought up. If you keep them out of the administration, they will become mere critics of the administration. Now, the limits of fair criticism are soon reached, after which there can be only unfair criticism. If you have a large section of the community in the position of mere critics, fair criticism being soon exhausted and unfair criticism having set in, each succeeding critic tries to go one better than each preceding one, and thus the criticism passed tends daily to become more and more unfair. In the interests of the administration itself, therefore, it is necessary to admit the educated class of the country to a share in the responsibility of administration, and to give it an interest in that administration. Therefore, Sir, there can be no more a return to the past. If that is accepted, and if

the state of things is as I have already described it to be, what is the remedy? That is the next question. Let us recapitulate again the requirements of the situation. Those requirements, to my mind, are three. In the first place, we want more government on the spot, and more expeditious government. These departmental delays and this excessive reliance upon the bureaucracy—from these the District Officer ought to be freed. More expeditious government, more government on the spot, that is the first requirement. The second is, an interest in the administration must now be given to the educated class that has come into existence,—an educated class with which the official class must, moreover, learn to get on. And the third is that provision must be made for the grievances of the district being ventilated in a responsible manner in the district itself. This is an aspect of the question to which I attach great importance. If these grievances have to be taken to the provincial administration, and have to be brought up for discussion in the Provincial Councils what happens is this. The grievances from the whole province gather together, and come in one stream, so to say, before the Provincial Government,—in one stream when a meeting of the Legislative Council happens to be held; and that conveys an altogether erroneous idea about the whole administration as though things were wrong here, there, everywhere. What is necessary is that as a grievance arises it should be dealt with as far as possible, on the spot. There should be opportunities available to the people to bring it in a responsible manner before the head of the district and have it removed. Then it ceases to be a subject of discussion in so many homes. Then it ceases to breed that poison which gradually comes to fill the air and does infinite mischief both to the Government and the people. These, then, are the three requirements of the situation.—Now my proposal is that the Government should take steps to create in each district an Advisory Council, constituted on the lines I have indicated. Of course, the suggestions are only tentative, and the actual details will have to be carefully worked out before any change of this magnitude is introduced by the Government. But I should like an Advisory Council in each district partly elected and partly nominated. Supposing it is a council of 9, I should have 5 members elected and 4 nominated. Or if it is a council of 12, I should have 8 elected and 4 nominated. I should leave the power of nomination into the hands of the Collector, who will then be able to appoint men who do not care to stand for election but whom it is desirable to have on the Council. But a majority of the Council must come in by election because it is the only way, known to modern times, by which you can give representation to different interests. A Council then, should be created in every district, as far as possible of which two-thirds, or any other proportion more than half, should be elected, and the rest, less than half, nominated. This Council, to begin with, should have only advisory functions, though they need not always remain advisory if the experiment proves a success. In this country, in our exceptional situation, we can progress only tentatively, and from experiment to experiment, as each experiment succeeds. If the proposed experiment proves a success, more responsible powers could certainly be entrusted to the Councils in due course. It is necessary that the Advisory Council should be a small body, in order to meet the objection that has been raised by some that it might otherwise degenerate into a

talking body. A body of nine or ten members, sitting round a table with the Collector, assisted by other district officers, meeting once a month would be able to dispose of a lot of business on the spot, which at present involves endless delays, and indirectly to get rid of a lot of poison which now gathers in a district from day to day, and which tends to vitiate the air in a manner, truly regrettable. This is roughly the proposal that I am putting forward. I may mention that there is an analogy for this in Western countries. On the continent of Europe I find in several countries bodies like the Council that I am proposing, only possessing more responsible powers. I will mention one case—that of Prussia. Of course, I have no personal experience of this matter and my knowledge is derived entirely from books. But this is what I find to be the state of things in Prussia. I am quoting from Woodrow-Wilson's 'State':—'The Government district in Prussia is not an area of self-government, but it is exclusively a division of state administration.' A district in Prussia is nearly the same in area as a district in India. The average district in Prussia is about 3,800 square miles; the average district in India is about 4,100 square miles. 'Its functionaries are the principal,—it may even be said the universal,—agents of the central government in the detailed conduct of administration they are charged with the local management of all affairs that fall within the sphere of the Ministries of the Interior, of finance of trade and commerce, of public works, of agriculture, of ecclesiastical and educational affairs and of war, exclusive, of course, of such matters as are exceptionally entrusted to officers specially commissioned for the purpose. In brief, they serve every ministry except the ministry of justice.' These functionaries of the district are called the 'Administration' and they work through boards. I need not trouble the Council with details. The President of this body, who corresponds to our Collector, and who is the special representative of the Ministry of the Interior, works alone. All the other departments work through boards. This is how the position of the President is described:—'The president of the administration is the most important official in the Prussian local service. Not only does he preside over the 'Administration,' the general and most important agency of local government; he is also equipped for complete dominance. He may, upon occasion, annul the decisions of the 'Administration' or of any of its Boards with which he does not agree, and in case delay seems disadvantageous, may himself command necessary measures. He may also, if he will, set aside the rule of collegiate action and arrange for the personal responsibility of the members of the 'Administration,' whenever he considers any matter too pressing to await the meeting and conclusions of a board, or, if when he is himself present where action is needed, he regards such an arrangement as necessary. In brief, he is the real governing head of the local administration. The jurisdiction of the 'Administration' covers such matters as the state, the churches, the schools, and the public domain, etc.'

Now comes the analogy. There is a district committee associated with this officer. It is described by the author as follows:—'Although, as I have said, the Government district is not an area of self-government, a certain part in the oversight of governmental action in the district is given to lay representatives chosen by the provincial agents of the people. A district committee (there is a long German name which I dare not pronounce), composed of two professional members (one of whom must be

qualified for judicial office, the other for the higher grades of the administrative service) appointed by the king for life, and of four members chosen by the Provincial Committee for a term of six years, is allowed an oversight of such matters as it has been thought best to put under lay supervision. The President of the Administration is an *ex-officio* member of the committee and usually presides over its sessions. All orders or arrangements which he wishes to make with regard to local police are subject to its confirmation, and all questions regarding the control of subordinate local authorities fall to it. More important than its administrative functions are the judicial functions with which it has been recently invested' but that refers to matters which do not concern the present discussion.

Here then we have an analogy which in many respects is useful for our purpose. I find that in some other countries too there are similar bodies. So the idea may well be taken up and worked out.

I may mention that I ventured to submit my proposals on this subject to the Decentralization Commission, before which I gave evidence, and if the Council will bear with me, I would like merely to repeat briefly here what I said there, as regards the principal details of the scheme. Roughly I would divide the functions of the Collector into four categories. First must come matters, which are urgent and confidential, in regard to which, of course, he must have the power to do what he thinks proper without consulting the Council. Secondly there would be matters which he must refer to the Central Government for final disposal, whether there is a Council or not, but in regard to which he would express an opinion or make a recommendation. Here the opinion of the Council should also be ascertained by him and forwarded to Government along with his own opinion. The third division, and here is what would make a great difference to the people, would be of matters, which the Collector should be empowered to dispose of on the spot, if he is able to carry his Advisory Council with him but which he must otherwise refer, as at present, for orders to the Central Government. This is what will really constitute in some respects the distinctive feature of the scheme, freeing the Collector from the present excessive Secretariat control, and associating with him a small body of non-official representatives to prevent his being a mere autocrat and giving the people some voice in the disposal of their affairs. What I would like to see is that the Collector should be the head of an Executive Board, consisting of the Engineer, the Educational Inspector and other officers belonging to the other departments in the district. And he should have in addition an advisory council like the one I have outlined. With the assistance of the Executive Board, he should carry on the general administration of the district and many matters which he at present has to refer to the Central Government he should be empowered to decide on the spot with the assistance of his Advisory Council. The last division will be of matters, in which the Collector though bound to consult his Council, should be free to act as he deems best, taking or rejecting the advice of the Council, as he likes.

In my evidence before the Decentralization Commission, I stated briefly what matters should belong to the different categories. The lists were prepared with much care and thought and with the assistance of men who had spent their lives in the work of administration; so it could not be said that the proposals had emanated from men who did not know anything of the administra-

tion of the country. In making these lists, I necessarily had in view the type of administration which prevails on the Bombay side; but substantially they might be made to apply to other Provinces as well. Leaving confidential matters alone, and taking the second category, I would include in it (1) Legislative proposals (2), proposals of revision of settlements, (3) revision of water-rates, (4) recommendations about remissions of land revenue, (5) creation of new Municipalities, (6) extension of the operation of Acts to new areas, (7) imposition of punitive police and (8), creation of new posts. All these matters must go to the Central Government in any case, but the Collector should ascertain the opinion of his Council and send that opinion along with his own. In the third category, which concerns the most important part of my scheme, I would have matters, which, as I have already explained, the Collector should dispose of finally if he is able to carry his Council with him, but which he must otherwise refer to the Central Government. If the Council does not agree with the Collector on any question, nothing will be lost, as the matter will go to the Central Government as at present, but where the Council agree with the Collector he should be freed from the control of the Secretariat, and the matter decided there and then. Among such matters would be (1) opening, location and abolition of liquor shops, (2) suspensions of land revenue, (3) levy of building fees, (4) city survey proposals, (5) organization of local supply from forests, (6) opening of new and closing of old schools, (7) establishment of village Panchayats and Unions, (8) suspension of Taluka Boards, Municipalities, Panchayats and Unions, (9) creation of Benches of Magistrates, (10) rules regulating fairs, processions etc., and (11) assumption of property under the Court of Wards Act. Lastly would come those matters which the Collector may decide as he deems best, even against the opinion of the district council, such as (1) urgent precautionary measures against plague, cholera and other epidemics, (2) measures for the preservation of peace, (3) measures of urgent famine relief, and so forth.

I have endeavoured to give the Council an idea as to what I have in my mind in bringing forward to-day's resolutions. If this proposal is taken up by the Government for serious consideration, the details will necessarily have to be carefully worked out by men qualified to deal with the question. But what I have said should suffice to convey to any one a sufficiently clear notion as to what I would like to see established in every district as far as possible. In addition to the matters enumerated by me, the members of these Councils should have the power to discuss grievances relating to the Administration of the district at their meetings, which should be held, say once a month. Sir, it is necessary to state that the idea of Advisory Councils formed in a general way the subject-matter of a good deal of evidence before the Decentralization Commission. Unfortunately the Commission did not take up the question seriously. If you look at the cross-examination of witnesses on this subject you will find that there is hardly any cross-examination, worth the name. The Commission simply did not care to go fully into the matter. However, that need not deter us from bringing up the question before this Council whenever a proper opportunity presents itself. The fact has to be noted, however, that the question was before the Decentralization Commission. And on analysing the evidence given by official and non official witnesses, Englishmen and Indians, we got the following

results—About 68 English officials gave evidence on this subject. Of them, 10 were favourable to the idea of Advisory Councils, 9 being in favour of District Councils and one in favour of Divisional Councils only. Among the nine, were two gentlemen, who were members of this Council, the Hon. Mr. Le Mesurier and the Hon. Mr. Qate. I am sorry neither of them is now in the Council, else I should have expected to be supported by them. Nine members of the Civil Service in favour of this proposal, as against 58 against the proposal leaving out the late Sir Herbert Risley, who was in favour of divisional, but not of district councils—may appear to many to be a small proportion. But, considering that the Civil Service in this country is the standing conservative party in Indian administration more firmly rooted in absolute power than the conservative party in England I think nine out of sixty-seven is a much more satisfactory proportion than that of the Liberal Peers in the House of Lords who were in favour of Parliamentary reform last year. To my mind, therefore, it is a hopeful thing, that on the first occasion of a proposal like this coming up for consideration, nine members of the Civil Service should be found to be favourable to the idea. I am not surprised that the rest were against it. Then 4 non-official Europeans gave evidence on the subject and it is significant that all the 4 were in favour of the proposal. Further, of the 84 non-official Indian witnesses who gave evidence, 71 were in favour. Some of them wanted the Council to be more than merely advisory but, in any case, all in favour of constituting Advisory Councils and only 13 non-official Indians were against it. When we remember how many public men in this country—I will not say, take their cue from officials, but I will say have such humility about them that they distrust their own opinion about any matter when it comes into conflict with official opinion, it is really surprising that the number of those that went against this proposal was not larger than it was. Finally fourteen Indian officials gave evidence on this question and of these seven were in favour of the proposal. This too was not unsatisfactory taking into account the nervousness of many Indian officials in expressing opinions not likely to find favour with their superiors. Thus the overwhelming weight of evidence on the non-official side was in favour of this proposal, and it had also the support of a small but important minority among the official witnesses.

Sir, I will now say a few words about the more important objections that have been urged against this proposal. I have carefully gone through a great deal of this evidence—and I may say that the objections resolve themselves under five heads. In one brief sentence they really come to this. The officials say—we do consult people at present and will continue to consult them; but we will consult whom we please, when we please, and how we please, we do not want to be bound in these matters. The five objections are, first, that informal consultation is better than formal consultation, secondly it is difficult to know who are the real representatives of the people, and it is difficult to get properly qualified representatives for the work, thirdly, the efficiency of the district administration will suffer, fourthly, an advisory body may be desirable but there are already District Boards and Municipalities which might be utilized for the purpose, why multiply these bodies? And lastly there is the objection which is a standing argument in this country against any advance, namely—'the time has not yet come'. Now I will deal briefly

with these five objections, and then will bring my remarks to a close. As regards the value of informal consultation, well, it is all very well to say that you do not want to be formally tied down, that you like to be free, and that you will go about among the people and find out things for yourselves. On the one side you complain that you are tied to your desks, you are slaves to reports and returns, that you cannot find time to move among the people, and on the other hand you do not want to be bound to consult anybody, you must be free to consult whom you please. Again, Sir, we have plenty of experience of what this informal consultation means, and in this matter we can speak as no English official can, because they have no experience of our side of the shield. Under the present system of consulting whom we please, we often find men of straw, men of no character, manœuvring themselves into the favour of officials and backbiting innocent people and exercising a pernicious influence. In the end, these things are generally seen through but that takes time and meanwhile a good deal of harm is done. And with the frequent transfers of officers that now take place, we are exposed to the risk far too often. But apart from this, without putting it on that low ground, I say that while the officials may continue to consult 'whom they please' and my proposal does not come in the way of their doing this—all we want is that they should be bound to consult a body of representative Indians, properly constituted. We want a sense of responsibility to attach to the man who is consulted on our behalf; he must not be an irresponsible self-seeking person, going to the Collector and expressing views which would just suit the particular mood of the Collector at the moment, he should feel the responsibility of his position and should know that he has a responsibility towards the people. To me, Sir, this argument of informal consultation appears to be the weakest argument that has been advanced against the proposal. Some say that it would be better to hold periodical Durbars than to have a 'standing Advisory Council.' Now we all know what these Durbars are. A large number of people assemble—a hundred or so—and you cannot consult them in that definite manner in which you can do so at a small board meeting. The second objection is that it is not possible to know who are the real representatives of the people. Well, Sir, it is too late in the day now to start an argument of that sort. The Government has accepted the principle of election for ascertaining who should represent different interests in various deliberative bodies, in Legislative Councils, in Municipal Boards and in District and other Boards. That principle, after all, is the only open test available for testing the representative capacity of a given person. I have already said that the results of election should be supplemented by keeping a certain reserve of seats in the hands of the Collector and that by nominating deserving persons to those seats, he may redress any inequalities as regards the representation of different interests. And I agree with the opinion expressed by the Hon. the Home Member—I do not know what line he will take to-day, but I agree with the opinion expressed by him as Chief Commissioner of the Central Provinces—that if an advisory Council comes into existence, it must grow out of the present district boards. My own opinion is that the District Board should elect the major portion of the members of the Advisory Council. Sir, the third objection urged against my proposal is that efficiency will suffer. But why should efficiency suffer? I do not propose that the

ordinary routine of the Collector's administration should be at all interfered with by the Advisory Council. The Council will meet once a month, and if the efficiency of the Government of India does not suffer by the discussions that take place in this Council—though some officials may think that the time of the Council is wasted by these discussions—or if the efficiency of the Local Governments is not diminished by the discussions that take place in the local Legislative Councils, I do not see why the Collector should want to be more absolute in regard to his charge than the Government of India or the Local Governments. As a matter of fact I think the efficiency of the district administration will increase and not diminish on account of the association of a body of popular representatives with it.

The fourth argument against my proposal is that there are already District Boards and Municipalities in existence. Why not use them for Advisory purpose as well? But, Sir, the Municipalities are concerned with particular towns only. As regards District Boards, my own view is that the districts are really too large as areas for the purpose of local self-government, and I should like to see rural local self-government entrusted almost entirely to Taluka or Sub-Divisional Boards and to village panchayats, the District Boards confining themselves to work of a general character only. If this were done and the constitution of the District Boards modified, I should not mind entrusting those Boards with the functions, which I have in view for Advisory Councils. But that is a different question and I do not want to complicate matters by going into it just now: The District Boards at present look after education, sanitation and roads. If the Government is prepared to widen their scope of work and entrust other functions to them in addition, I have no objection. Lastly, we are told that the time for such a reform has not yet come. That, Sir, is an argument with which we are only too familiar. In the opinion of some officials, the time for any reform never comes, and yet somehow it does come and reforms do take place. And, Sir, what has happened in the past about other matters will happen in the case of this also, and in spite of official opposition the time for this reform will come.

Sir, one word more in conclusion, and I have done. I contend that the association of a Council, such as I propose, with the work of district administration will, instead of impairing the efficiency of that administration, greatly increase it. For it will bring to it that higher efficiency, which results from the responsible participation of the people in the management of their own affairs, and which can never be attained by a purely bureaucratic administration, however like a machine it might move. District administration, moreover, is the real ground of contact between the bulk of the people and the British Government, and our Legislative Councils, expanded as they are, will not fully serve the end, for which they have been reformed, unless that reform is supplemented by the creation of Advisory District Council and their association with the officers in charge of district. Sir, I have already urged at some length in the interest of the administration itself the educated classes of this country should be given an interest in the work of that administration. What they feel is, if I may quote what I said before the Decentralization Commission, that the car of administration should not merely roll over their heads, but that they should be permitted to join in pulling at the ropes. This is a perfectly legitimate aspiration, which, I am

FEUDATORY INDIA.

Baroda.

We have received the Baroda Administration Report for 1910-11, and the Census Report of the Baroda State for 1911. The publication of the report volume of the census is delayed owing to the statistics of Birth Place in some Provinces in India not being yet available but the main results of the census can be gathered from the summary of the report now published. Rao Bahadur Desai, B.A., LL.B., Superintendent of the Census Operations has some valuable observations at the close of his Report. "There is yet a feeling of false pride which makes some members of the high castes prefer to starve rather than accept manual occupations. The dignity of honest labour is not yet thoroughly recognised. A great change has, however, already taken place, and in the struggle for existence there is a growing tendency to set aside old ideas and yield to necessity."

The Administration Report for the year ending 31st July 1911, does not show any extraordinary event of importance. It is a record of steady and substantial work conducted on lines already laid down by the sagacity of His Highness the Gaekwar. An important feature of the Baroda State is the comparative degree of independence and non-interference which the Municipalities enjoy. The result of the experiment has proved a success: and Local Governments are learning financial self-reliance and are building up a sound and efficient constitution. The report says that the agricultural prosperity of the ryots is not satisfactory owing to the heavy frost which blighted the crops in an extensive area. The rains have not been regular and there has been a widespread failure of crops. But adequate measures have been adopted by the State to relieve the distress of both men and cattle and it is hoped that the advent of a propitious monsoon will bring better fortunes to the cultivators.

The Late Maharajah of Mourbhanj.

The Late Maharajah Sriram Chandra Bhanj Deo was born in 1872; succeeded to the *gadi* as minor on 29th May 1882. The late Maharajah was born of a Kshatriya (Hindu) family claiming descent from Adhi Bhanj, said to have been a Kachhwaha Rajput, and a connection of the then Raja of Jaipur. Adhi Bhanj is believed to have come from Rajputana into Orissa about 2,000 years ago, and gradually to have established his authority over the country between the Subarnarekha river and the border of Dhenkanal. Subsequently a member of the Mourbhanj family named Joti Bhanj established himself in the southern part of this territory as Raja of Keunjar, and Adhi Bhanj retained the country between the Subarnarekha and Baitarani rivers, which is Moharbhhanj proper. Thirty-nine generations of Rajas intervened between Adhi Bhanj and the late Raja Krishna Chandra Bhanj Deo, who was granted the title of Maharaja, as a personal distinction, on 1st January 1877, on the occasion of the Proclamation of Her Most Gracious Majesty as Empress of India—as also his grand-father, the Raja Jadu Nath Bhanj Deo, had many years before been granted the same personal distinction for his services in quelling a rebellion in the Kolhan. The eldest son and heir apparent of the Raja in the State is entitled to the courtesy title of "Tikait Babu" and the family cognisance is the sacred peacock with tail spread. The area of the State, which is one of the Orissa Tributary Mahals is 4,243 square miles, its population is 385,737, divided almost equally between Hindus and aboriginal tribesmen. The Raja maintains a Military force of 512 infantry and 11 guns.

The Maharajah of Patiala's Boons.

The Maharajah of Patiala held a Durbar on the 28th March to commemorate the bestowal of the G. C. I. E. on him on the occasion of the Delhi Durbar. His Highness made an interesting speech at his Durbar at which he announced the following boons to his subjects which will certainly be appreciated by them — Rupees one lakh and a half for the improvement of towns; rupees fifty thousand for a model sanitary village; rupees thirty thousand for female education; the raising of the Mohindra College to the M. A. standard and improvement in the grades of Professors; rupees twenty thousand for primary education and rupees ten thousand as recurring grant for primary education; a town hall and a library to be built; three new grain marts to be opened, the opening of a number of schools including one for music; and the restoration of Chandar Singh's confiscated property

Mysore Economic Conference.

As a result of the long deliberations of the Industrial section of the Mysore Economic Conference, it has been decided to open a tile factory under Government management and with that end in view, the Government have been pleased to depute Mr. G. Subbasami Iyer, B.A., LL.T., Superintendent of the Industrial School at Mysore to Mangalore to study the process of tile manufacture. In the agricultural section, a dozen students are allowed scholarships to learn horticulture in Lalbag under the supervision of Mr. G. H. Krumbeinzel, Economic Botanist, and four students to learn sericulture in Tata's Silk Farm at Basavanagudi which is now under the management of the Salvation Army. In the Educational section, to bring about some practical results, Mr. C. Krishna Rao, B.A., has proceeded to Travancore to study educational methods there.

Redistribution of Native States.

Consequent on the creation of New Provinces the following redistribution of Native States are notified in a *Bihar and Orissa Gazette, extraordinary*, dated April 1, 1912 Bengal:—Cooch-Bihar, Hill Tipperah. Bihar and Orissa—Athgarh, Athmalike, Bamra, Baramba, Boud, Bonai, Daspalla, Dhenkhal, Gangpur, Hindol, Karood or Kalabandi, Keonjhar, Khandpara, Kharsawan, Moharbanji, Narsingpur, Nayagarh, Nilguri, Pal Lahara, Patna, Ranpur, Rehrakhel, Sonpur, Seraikela, Talcher, Tigiria Assam: Manipur.

The Viceroy on Native Princes.

The following advice administered by the Viceroy to the members of the ex-royal family of Oudh will, we hope, be an eye-opener to the nobility in India.—

"These are not the times in which it will suffice for a man to sit with folded hands and boast of ancient lineage. The days are past when a long line of ancestors was of more repute than personal worth and personal character. If there is anything in blue blood or family tradition, let it inspire you with the ambition to be not idlers or dreamers, a burden on the community, but strong and steadfast men taking your proper place as leaders of the people... You cannot do this unless you are able to hold your own in the rough tumble of the world about you, and the first essential is education"

Indian Princes in Europe.

Maharajah Kumar Saheb Vijay Singhji, heir-apparent of the Rajpipla State, and Kumar Digvijay Singhji, accompanying the Prince as his companion, are proceeding to Europe on the 6th instant, by the steamer "Mooltan", Kumar Narsinhbhaiji of Rajpipla is also going to Europe, on the 6th, with his son Kumar Himat Singhji and Pravin Singhji Duginjay Singhji's son.

INDUSTRIAL AND COMMERCIAL SECTION.

Why Steel in Concrete Won't Rust.

In these days of steel and concrete construction work, structural engineers are frequently asked what the fate of buildings will be when the steel beams have rusted away. The best answer to that is founded in the report of the surveyor of St. Paul's Cathedral, who recently caused an opening to be made in the concrete of the dome in order that the condition of the great chain which binds it at its base might be disclosed. This chain has been imbedded in concrete for more than 200 years and it was found to be as bright and perfect as when new. The reason why steel encased in concrete is prevented from rusting is, we are told, that the oxide of iron chemically combines with the cement, forming a covering of ferrite of calcium, which is a good protective agent.—*Science* *Siftings*.

Manganese Deposits.

Rich Manganese deposits are known to be scattered all over the Districts in the Central Provinces, says *Commerce*, and several Indian Syndicates are working the mines, among them being the Central Provinces Prospecting Syndicate, the Central India Mining Co., the Nagpur Manganese Syndicate, the Satak Manganese Co., Messrs Byramji Pestonji and Co., and others. The Sataki Mine at present yields about 25,000 tons of ore annually.

Smoke Nuisance.

Frederick Dybro, an American engineer believes he has an invention which will solve the smoke nuisance in every city in the country. He has been granted a patent and for three months has been trying the invention in his yard with apparent success at every trial. He is confident that it will work a revolution, and sooner or later be perfected so as to apply to railroad locomotives. His experiments contemplate its use by stationary

engineers at first. The home experiments of Dybro show, according to his claims and those who have watched him work, that his invention not only solves the problem of consuming smoke, but that it is a great economiser of fuel. He is going to guarantee that it will save 10 per cent. of the coal, and claims, without guarantee, that it will save 40 per cent. in many instances.

Tata's Triumph.

The Industrial resources of India have only recently commenced to be tapped according to the latest scientific principles, and foremost among these enterprises is the Tata Iron and Steel Works at Kalimati. Operations for smelting steel and manufacturing rails were started at this gigantic factory some time last year, but it was not until March 15, 1912 that the first successful charge was accomplished. On the same day the first consignment of rails was successfully manufactured and Messrs. Tata may indeed be congratulated upon their latest achievement. The first charge was made last January, but was unsuccessful owing to the crumbling of the bricks, which although sufficiently tried, were not compact enough to stand the severe test. However the promoters not daunted by the first partial failure, lost no time in remedying the defect and at 2-30, in the afternoon of March 15, the first successful charge of 20,000 tons of molten steel was accomplished, and, ever since a similar charge has been made every eight hours, so that at the present time 6,000 tons of molten steel are turned out per diem. For several days a commission of Government experts supervised the working and tested the efficiency of the rails. It is now stated, that the rails turned out have passed the test of the Government commission and the rails were found thoroughly suitable for railways. This is an achievement which India and the Tata Iron and Steel Works may rightly be proud of.

We learn that the charge rooms of Tata's Iron and Steel Works, where the steel is melted are entirely manned by steel smelters from Germany.—*Empire*.

Southern India Chamber of Commerce

At the second annual general meeting of the Southern India Chamber of Commerce held on Saturday, the 30th of March, under the presidency of Rao Bahadur P. Theagaraya Chetty, the report of the past year's working was submitted; and, in moving its adoption, the Chairman referred to the past season's crop returns, foreign trade, commerce and legislation and India's industries. Regarding foreign trade the Chairman remarked that, in introducing the financial statement in the Imperial Council the other day, the Hon the Finance Member observed that the record of our over-sea commerce was an impressive one and that the value of our exports was the highest on record. So far as this Presidency is concerned, the total value of exports, excluding treasure, during the first eleven months of 1911-12, as compared with the corresponding period of the previous year, shows an increase of Rs 1667 lakhs. The exports of 1910-11 exceeded those of the previous year by a little less than 150 lakhs, and this had been exceeded by over Rs. 16 lakhs while yet there was a month to run.

Bamboo Hats. A Growing Industry.

A growing industry and one that promises to experience a steady growth in the future is the manufacture and export of bamboo hats, which has received a remarkable impetus since that passage of the Payne Aldrich Bill providing for the free admission of these hats into the United States.

The following article on bamboo hats is taken from "Reciprocity and the Philippines," published by Mr. Harold M Pitt —

Among the lesser industries of the Islands is the manufacture and export of hats made of bamboo. This is an industry that is carried on in the homes of the natives of certain sections of the islands, and the work is all done by hand.

France is the best customer for these hats, and in 1909 took 227,603, valued at \$73,327 out of

a total export of 410,842 valued at \$142,480. The Payne-Aldrich Bill provided for the free admission of Philippine products into the United States, and opened up a new market there for these hats, and in 1910 there were exported to that country 176,938, where in the preceding year there had been but 12,169. The total exports in 1910 increased to 600,486 hats, value \$276,309.

As the hats are very favourably received wherever introduced and are comparatively cheap, the industry is one that will probably experience a steady growth. The material for their manufacture is found in almost every section, and as the demand increases the industry will doubtless be more generally introduced among the people, thus adding in a substantial way to their earning capacity. The making of these hats does not interfere in any way with the agricultural pursuits of those who are engaged in the work, as the women and children devote their spare time to it — *Manilla Bulletin*

Indian Labour Commission.

We congratulate the Indian South African League at Madras on the resolution it has passed to depute a Special Commissioner to investigate the condition of Indian emigrants to Ceylon and Burma. Emigration to these places has for some years been mostly voluntary. But cases of hardship and suffering on the part of youthful labourers in the plantations are by no means being wanting. It is not every one that is fit to toil in a foreign land under unfamiliar surroundings often much against one's own inclinations. But they have the option of quitting the uncongenial occupation at any time unlike the indentured labourers. Even in their case there is this question to be answered whether the emigrants are as prosperous and healthy as they are represented to be. The latest complaint from Ceylon is that where the indentured system is still prevalent, the labourer continues to be bartered from one estate to another utterly regardless of his protests. An Indian Commission can show the superiority of the voluntary system to the indentured system both of which exist side by side in Ceylon. — *Tribune*.

AGRICULTURAL SECTION.

Help to Agriculture.

The thoughtful manner in which the British Government has set itself to help British agriculture was explained recently by Mr Runciman. Assistance, he said, would be given to Agricultural Colleges and other institutions to the extent of £12,000 a year, and altogether about £35,000 a year would be spent on research and experimental work. These institutions were handicapped by the lack of man, and therefore £16,500 a year was to be devoted to what would be called scholarships for these Colleges for the training of young men who were prepared to devote their time and their energies to the work of these institutes and agricultural classes. His interest in agriculture did not begin when he entered his present office. When he went to the Board of Education school gardens were attached to only a few hundred schools. Now throughout the rural districts there were 5,000 school gardens. For the farm institutes they had got a sum of £325,000, and they were at present considering the best means of spending that money to practical advantage. On the question of disease Mr. Runciman said there was no doubt that one reason why they enjoyed immunity from cattle disease in that country was because they had prevented animals coming in from abroad.

Fish Factories in Madras.

Sir Frederick Nicholson was recently at Calcutta in connection with a fishery station to be opened for experimental work in canning and curing. The canning experiments are to be in respect of all classes of fish. Sir Frederick, who expects to stay in the Madras Presidency till the end of this month, regularly visits the Tanur station, where the work done comprises catching and curing, but not canning. Manufacture of fish oil and guano are also being undertaken.

The work at Cannanore station is being continued. Oil and guano processes, which already have been attended with encouraging results, are being further developed, chiefly in the direction of economy in production and improvement in the quality of the oil. That public interest has been fairly aroused may be inferred from the fact that as many as forty-five small fish oil and guano private factories have sprung up along the coast between Malpe and Tanur. There is no present idea of undertaking oyster culture experiments on the Madras coast, but oysters raised on the Pulicat beds will soon be on the market.

Rice Crops in the Far East.

The latest reports on the rice crop in the Far East are far from encouraging, writes the Rangoon correspondent of the *Pioneer*. Fears are now expressed that the harvest will be so poor that scarcely 40 per cent. of the normal crop can be obtained. Lake Sam, Penang is a bad sufferer. The conditions in the districts of Penang, parts of Kedah and Prai are exceptionally unsatisfactory, and it is estimated that the season crop is likely to fall 70 per cent below a good season's crop. In Shanghai great uneasiness prevails as owing to the conditions in China local production of rice has been severely interfered with and in order to augment internal supplies a heavy demand is certain to be made on outside supplies. The prospects of the rice harvest are also unfavourable in Japan, Java, Hongkong, Malaya and the Philippine Islands, and it is well known locally that Japan has been practically the first foreign customer this season to make purchases of Burma rice. The quantity, exported since 1st January last to that country amounts to very nearly 16,000 tons against 5,400 tons for the corresponding period of last year. Java has been hard hit and this country, which did not previously deal direct with Burma, has already taken about 55,000 tons of rice from Rangoon. The Straits and China have been indenting largely on Burma and in view of last year's stock being practically exhausted, there is danger of injudicious exportations from Burma taking place.

Sugarcane Crop in E. B. and Assam.

The final forecast on the Sugarcane Crop of Eastern Bengal and Assam, 1911-12, says:—

In this province where sugarcane is never irrigated the success of the crop depends on an abundant and well distributed rainfall. From April to November these requirements were so well fulfilled that the subsequent entire absence of rainfall has caused no serious loss. During the floods low-lying fields of cane were damaged to a small extent. Borers have not proved more than usually destructive and the red rot disease appears to be less prevalent than it was a few years ago.

Revisions of area estimates have not caused any substantial change, the total estimate for the provinces being now 179,300 acres, as against 181,300 acres in 1910-11.

District officers' estimates of outturn average 89 per cent. of normal yield; but in several cases these estimates are too low. In Rajshahi division where 51 per cent. of the entire cane crop of the province is produced, unofficial reports indicate that yields much above average are being obtained. Though the whole of the plant cane will not be cut till more than 3 months hence, conditions are not likely to change much in the interval and it will be safe to estimate for the province an outturn of 100 per cent.

On the basis of a 100 per cent. crop, for which the normal yield is 24 cwt. per acre, my estimate of the total outturn of *gur* from cane this year is 4,303,200 cwt., or 10 per cent. more than last year.

The quantity of *gur* produced from the juice of the date palm is estimated at 801,200 cwt., two-thirds of which is produced in the districts of Faridpur and Backerganj. This estimate is based on an enumeration of the trees kept for *gur* production and the average recorded yield per tree. The present estimate is believed to be more nearly accurate than those of previous years.

Has the fertility of land in India decreased?

In an article contributed to the pages of the *Agricultural Journal of India* Dr Bernard Coventry sets forth the results of his inquiry on this question with respect to soils and crops in the several Provinces. In the United Provinces the Settlement literature gives no grounds for concluding that there has been any general change in fertility within the British period. But in the north of the Province a large portion of the land must have lost its virgin productivity under continued cultivation while elsewhere lands have decreased in fertility owing to known causes such as interference with drainage. In Bombay the Director of Agriculture holds to the view that in ancient times the condition should have been worse, but gives no convincing reasons for the conclusion he has arrived at. In Madras it is said that land is continually improved by manuring, but where population is sparse and rainfall precarious the land is allowed to lie fallow. The inference is that in either case there is no loss of fertility. Security of tenure and increase of population have raised the price of land and cultivation no longer pays unless the lands are continually improved. The Director concludes that fertility must be greater than formerly. In the Punjab in the canal irrigated area fertility has increased 'enormously,' but with reference to the Province generally it is believed that 'while the older lands cannot be said to have either gained or lost in fertility, the influence of Chahi and Nahri irrigation has enormously increased the productiveness of large areas.'—*Tribune*.

Dried Potatoes

The drying of potatoes is an industry that has been developed in the past five years in Germany, where one-third of the world's potato crop is grown. During the past year an investigation has been made in Germany of the starch and dried potato industries, dealing especially with machinery and methods in use. The two general methods of manufacture are known as the roll system and the drum system. In the roll system the potatoes are steamed until softened, and then passed between large revolving cylinders which are heated by steam. The potato forms on the roll in a layer, which dries and is scraped off during a revolution of the roll. The drum system makes a product at about half the manufacturing cost of the roll system and for all purposes other than human food the drum system is used. It consists, essentially, of an iron shell about two and a half feet in diameter and eight times this length. From a cutting machine chipped potatoes are conveyed to the slowly revolving drum, which is provided with an interior construction that gives the potatoes the maximum exposure to the drying action of the hot air. In Germany most of the product is used as food for all kinds of animals.

Indian Groundnut.

The final general memorandum on the groundnut crop of the season 1911-12, issued by the Commercial Intelligence Department of India, under date Calcutta, February 15th, states:—This memorandum deals with the three provinces which produce groundnut to a considerable extent. The total area now returned is 1,200,900 acres as compared with 951,900 acres (revised figure) in 1910-11, which marks an increase of 26 per cent. The total outturn is estimated at 542,200 tons of nuts in shell as against 503,200 tons (revised figure) for last year—an increase of nearly 8 per cent.

Paddy and Sugarcane Manures.

Some very important results achieved with experimental manures are recorded in the Annual Reports of the Burdwan and Cuttack Agricultural Stations for the year 1910-11. At both stations it has been found that the ploughing in of "dhaincha" for paddy is the most economical of all systems. Mr. A. C. Dobbs, who writes the Burdwan Report, says that as much as possible of the paddy area from the farm is treated in this way, and the remainder is manured with bonemeal and superphosphate. The rotation of the two methods is maintained as far as practicable, the area that can be sown with green manure being limited by the rainfall and the amount of water available for irrigation. The use of bonemeal in combination with saltpetre has given striking results. At Cuttack it was found that three maunds of bonemeal in combination with saltpetre, gave results almost equivalent to one hundred maunds of cowdung, while on the Burdwan farm an extraordinary return was obtained from the use of three maunds of bonemeal with one of saltpetre. The method adopted for sugarcane at Burdwan is to use farmyard manure, oilcake, and bonemeal before planting, and to apply saltpetre as a top-dressing to the growing crop at intervals, when there is no danger of its being washed away by heavy rains. These are all indigenous manures, the last three being at present largely exported; and the experience gained at Burdwan, Cuttack, and Dumraon leaves no doubt that their judicious use of sugarcane will pay well.

Madras Gingelly Crop.

The Madras Board of Revenue has issued the following first outturn report of the gingelly crop of 1911-12.—The total area sown with gingelly in ryotwari villages up to the end of December 1911 was 363,000 acres or 6 per cent. less than the area sown in the corresponding period of 1910. It was also less than the averages of five and ten years by 10 and 19 per cent. respectively.

Departmental Reviews and Notes.

LITERARY.

ARCHAEOLOGY AT DELHI.

The Northern or Talaqi Gate of Purana Qila at Delhi is now being opened out by the Archaeological Department. It is fairly obvious that the mound in front of the gate-way is no accidental accumulation of rubbish and that it was put there for some purpose. Although there is no documentary evidence to account for its closing up, there are several traditions which are of interest in connection with it.

It is said that Humayun ordered a certain Faqir to pray for him which the Faqir refused to do. The Emperor in consequence ordered him to be boiled for three days in a large caldron; an order which was carried out, but which, it is said, failed to kill the Faqir. He was brought out alive and just lived long enough to curse the Emperor, saying that he (the Emperor) would die himself in three day's time. On the third day after the death of the Faqir the Emperor slipped on the steps of the Sher Mandal in Purana Qila and died. The daughter of Humayun deeming the Fort as being an inauspicious place of residence ordered it to be pulled down and the execution of her order was put in hand. The wall however were either too hard a nut to crack or too expensive to demolish and it was suggested that the blocking up of the North and South Gates would have the same effect. This was done.

The most commonly heard tradition of the closing of the gates is that of the wife of a Raja, who lived in Purana Qila, taunting her husband with fear of an enemy who was already almost hammering at the doors of his capital. The Raja was served at table with an iron spoon instead of the usual gold and silver one, and angrily asked if there was no more gold and

silver left in his treasury: the Rani rebuked the cook, saying he was a fool to use a spoon of the metal of which the Raja was so much afraid. Out went the Raja from the Talaqi Gate to battle vowing that if he did not return he would die fighting. He ordered the gate to be built up and not to be opened except to admit him on his return. He never came back and the Talaqi Gate was closed.

The other tradition is that the gate was closed up by Nizam Bhishti, who saved the Emperor Humayun from drowning. He was given the sceptre for three days and during this time issued a leather currency. He forbade the gate to be opened up except by one who should like him issue leather coinage.

DAILY NEWSPAPER FOR BEHAR.

On Thursday the Hon. Mr. S. Sinha presented before the Registrar, Joint Stock Companies, for Registration, a Memorandum of Association of the Behar and Orissa Newspapers, Ltd., a company formed with the nominal capital of three lacs, divided into shares of Rs. 10 each, with a view to convert the *Behares*, of Bankipore, from a weekly into a high class daily. The minimum number of the Board of Directors is fixed at 15 and the maximum at 31, and 22 Directors representing all the five divisions of the new Provinces are named as the 1st Directors for three years with power to add to their numbers. The five divisions Orissa, Chota Nagpur, Tirhut, Bhagalpur and Patna are adequately represented by respectable gentlemen: and the 22 Directors are fairly distributed among the divisions.

A MAHARAJAN'S BOOK.

The Maharaja of Nabha, better known as the Tikka Sahib of Nabha, has written a volume entitled 'European Travels and Reflections.' It will be published in London shortly.

EDUCATIONAL.

THE HINDU UNIVERSITY

The *Hindustan Review* writes: "The constitution of the Hindu University is yet, in a process of incubation, and it is difficult to say when and in what shape or form it will emerge from the process. The fact that in the composition of the deputation that waited upon the Hon'ble Sir Harcourt Butler at Delhi and also in the committee appointed to frame the constitution, the orthodox Hindus bulk largely, is by no means reassuring to those who are anxious that the University should be constituted on liberal and progressive lines. It is to be hoped that the reform party will have no cause for dissatisfaction and complaint when the constitution is published."

FEMALE EDUCATION IN BHOPAL

In commemoration of Her Majesty Queen Mary's visit to India, H. H. the Begum of Bhopal is devising a scheme for furthering Female Education, and is circulating open letters on the subject. The Begum's idea is to start a well equipped school, to become afterwards a model institution of its kind. Provision will be made both for the rich and the poor, Rs. 12 lakhs will probably be required at the outset, and details are being worked out. Her Highness has offered Rs. 1 lakh from the State and Rs. 20,000 from her private purse. Her daughters-in-law have promised Rs. 19,000 among them.

MODERN TELUGU

There is an instructive article on "Modern Telugu" in the current number of *The Educational Review*. The writer pleads for what may be called modernism in the Telugu literature. It is a plea for a more natural and appropriate style of Vernacular composition.

English of the Middle Ages is entirely different from that of to-day. Indeed it is the case with every language. Language is the product of the evolution of a community of human

beings and its life is regulated by the same general laws. When the views of a society of people change, the change is inevitably reflected in their language. In every country, people have wisely submitted themselves to this inexorable law of nature and their literature has consequently developed so as to serve the varying needs of time. Thus the English of Milton and Jeremy Taylor and Sir Thomas Brown have a quaint fascination for us, but no body would deny that Addison and Swift have given us a style more adapted to the practical requirements of modern times. Every century witnesses a new translation of the Bible and a 'revised version' does command greater popularity than the old edition.

But the Telugu pandits would not allow any such change in their vernacular. Most of the Telugu poets have been Sanskrit scholars and 'the language of their literary works is more than half Sanskrit and the rest is artificial Telugu made of obsolete words and coined phrases.' The bulk of what is called Telugu literature is made up of erotic works and it does not at all reflect the life of the people.

An Englishman would realise the difficulties of a student of Telugu (foreign or native) if he could imagine the English literary language to mean a language in which it is allowable to use every Latin word, phrase or even entire sentences and all the words and grammatical forms occurring in all the English books written from the time of Alfred till the time of Johnson, French or Spanish, Arabic or Persian, Indian or Chinese, but in which no word of the living language should be used.

Formerly Telugu poets wrote under the inspiration of old Dhruti learning. To-day Telugu has an individuality of its own. There is, at any rate, one thing on earth which even genius itself cannot invent nor utterly irradicate—and that is the language of a living people. Some modern writers have done exquisite work in Telugu literature. They are however condemned by the orthodox school of pandits. It is therefore necessary to make modern Telugu serve the purposes of modern life and modern activity. It can be done by making the language of the common people a literature for instruction and entertainment. The social force of such a vehicle would then be incalculable.

LEGAL.

JUSTICES OF THE PEACE.

A BILL FOR THE PROTECTION OF GIRLS.

The Hon. Mr. M. B. Dadabhoy, C. I. E., has presented a Draft Bill to the Legislative Department for the Protection of Women and Girls under 16 years of age and has applied for leave to introduce the same this Session. We understand the Bill is being now examined by the Law Officers of the Government.

NATURALISATION LAW.

The question of a uniform naturalisation law throughout the empire occupied a prominent position in the discussions of the Imperial Conference last year. The Colonial Office has now transmitted to the Government of the Overseas Dominions for consideration the draft of a measure designed to meet the situation. The main provisions are that naturalisation of aliens as British subjects shall be conditional on five years' continuous residence within territory under His Majesty's allegiance, good character, and an adequate knowledge of the English language (or of any other language recognised in any dominion as on an equality with English). In addition the applicant for naturalisation must also take the Oath of Allegiance. It is provided that the law shall become operative in each of the self governing dominions only after the local legislatures have adopted it. The right to be called a British subject applies to everyone who was born within His Majesty's allegiance, or who, at birth, was the child of a British subject on the paternal side, or was born on a British ship, whether in foreign or territorial waters.

WOMEN AS JURORS.

As jurors, in a number of recent cases, women in the Western States of America elicited praise and recognition from judges and high-minded lawyers. They did not display the supposed prejudice of their sex against certain classes or sets; they tried the cases on the issues of law and fact; they were anxious to do justice and avoid mistakes of the heart as well as mistakes of the mind.—*The Chautauquan*.

It is notified in the *Gazette of India* March 22nd that any European British subject appointed either by or in virtue of his office to be a Justice of the Peace for any country or place beyond the limits of British India, shall have in regard to European British subjects and persons accused of having committed offences conjointly with such European British subjects all the ordinary powers which may be conferred on a Magistrate of the First Class, under the Code of Criminal Procedure, 1898 and, in addition, all the powers which may be conferred on a Magistrate under Sections 186 and 190 of the said Code, also that any European British subject appointed, either by name or in virtue of his office to be a Justice of the Peace in or for any country or place beyond the limits of British India, shall have power to hold inquests under Section 174 of the Code of Criminal Procedure 1889.

THE ORISSA TENANCY BILL.

The withholding of H. E. the Viceroy's assent to the Orissa Tenancy Bill has raised an interesting legal point, as to whether the measure automatically lapses at midnight on the 31st of March. By the Act passed in the Imperial Legislative Council, all existing enactments are declared to be unaffected by the territorial changes and all enactments in force in or prescribed for any of the territory mentioned on the 1st April shall be construed in the terms of the new Administrations. The point whether a measure passed by the local Council that has not received the Viceroy's assent up to the 31st March can come legally into force in the redistributed territories if the Viceroy's assent is given at a later date. The Bengal Mining Bill which was passed by the Bengal Council on the same date has already received assent. The *Statesman* of the 30th March strongly criticised the Viceroy for not vetoing the Bill definitely if he disapproved of it.

MEDICAL.

MEDICINAL VALUE OF APPLES.

The *Dietetic and Hygienic Gazette* reminds us that the apple contains a larger percentage of phosphorus than any other fruit or vegetable. This phosphorus is admirably adapted for renewing the essential nervous matter of the brain and spinal cord. Also, the acids of the apple are of signal use for people of sedentary habits, whose livers are sluggish in action, those acids serving to eliminate from the body noxious matters which, if retained, would make the brain heavy and dull, or bring about jaundice or skin eruptions and other troubles. It is also the fact that such fresh fruits as the apple, pear and the plum, when taken ripe, and without sugar, diminish acidity in the stomach rather than provoke it. Their vegetable salts and juices are converted into alkaline carbonates, which tend to counteract acidity. A good, ripe, raw apple is one of the easiest of vegetable substances for the stomach to deal with, the whole process of its digestion being completed in eighty-five minutes.

INCREASE OF CANCER.

A startling article from the pen of the well-known vegetarian advocate, Dr. Haig, appears in the March issue of the *National Review* on the subject of the increase of cancer and its connection with the consumption of tea and meat. According to him, meat and tea are the principal producers of uric acid in the system, and are therefore the common causes of gout and eczema, which irritate the tissues of the human body and often lead to cancer. Cancer, Dr. Haig points out, is far more prevalent in Switzerland, the United Kingdom, and other more or less cold climates than it is in Southern Europe; while in Egypt it is almost unknown, as are gout and rheumatism—the diet in Egypt being much more conducive to uric acid freedom. On the other

hand, in China, where the inhabitants are rice eaters but tea drinkers, cancer is very prevalent. Dr. Haig also points out that in New Zealand, Australia, and in the United States, countries where the consumption of meat and tea is increasing, cancer is rapidly becoming much more common, and that in the United Kingdom the cancer death rate amongst men, since 1901, has increased more quickly than among women in the proportion of about 7 to 4½. The Doctor here asks the question whether this is not owing to the fact that men have taken to drinking tea during the last decade as freely as women.

POTATOES IN THE DIETARY OF DIABETIC PATIENTS.

At a meeting of the *Société Médicale des Hôpitaux* held on February 17, M. Rathery said that it was an error to suppose that potatoes were an article of diet permissible to diabetic patients; he considered, on the contrary, that they ought never to be freely permitted in such cases. He quoted a number of clinical observations showing, on the one hand, that even such very small quantities of potatoes as 50 grammes might suffice to cause a reappearance of sugar in urine, and, on the other hand, that diabetic patients did not by any means always assimilate carbohydrates of potatoes more easily than those of other starchy foods, they sometimes even assimilated them less easily. Speaking generally, it might be said that in the majority of cases of diabetes potatoes were to be considered as an article of food similar to other dietetic substances rich in carbohydrates. In some cases, however, potatoes seemed to possess special properties of assimilation which might be either greater or less than those of other starchy foods. This was in fact a particular example of the law discovered by Bouchardat, according to which each diabetic patient had a personal coefficient for the quantitative and qualitative utilization of carbohydrates.

SCIENCE.

EFFICACY OF HOMA.

In a very learned discourse on Empiricism and Science which formed the leading article of the *Pioneer* of the 6th September, there occurred the following statement:—'So, too, the theory that fires in public places tended to diminish epidemics was a theory based upon rough empirical observations. It was connected with the discovery—a very notable one in the progress of humanity—that fumigation prevents the decay of animal substances. That was probably a purely accidental discovery, and it was only in our time and in the West that it was found by patient experiment that the effect of smoke is antiseptic, or in other words, that there is something in wood smoke that is fatal to the germs that cause decomposition. M. Trillat finds that the rapid combustion of considerable quantities of sugar produces vapours of formic aldehyde—a powerful germicide. This antiseptic exists in the smoke of most wood fires. In 2 lbs. of fuel pine-wood contains 32 centigrams of aldehyde, oak-wood 35 centigrams, refined sugar 70 centigrams and ordinary incense 18 centigrams. The fires lit during epidemic, therefore, had a direct physical and chemical action, in addition to the moral effect of enabling people to do something to release themselves from hopeless and terrorised inaction!' So the Home of ancient India was not for nothing!

AN INDIAN HONOURED.

Professor Wali Mahomed M. A., of the Aligarh College, who was prosecuting his studies in Physics in England and Germany as a holder of H. H. the Aga Khan's Science Scholarship from the year 1908, has received the degree of Ph. D. from the University of Göttingen (Germany).

ARTIFICIAL GOLD.

Sir William Ramsay writes to the *Times*:—On the 20th January I wrote stating that there was no truth in a statement that I had furnished a favourable report on the supposed process for manufacturing gold artificially. A fresh statement has appeared in English and French papers purporting to publish this alleged report. It appears necessary, therefore, to give some details as regards the published letter.

Late in December of last year General Marquis Courtes called on me with a personal letter of introduction from M. Cambon, the French Ambassador. He explained that he was one of the possessors of a secret process for making gold artificially; and he brought with him a Monsieur Verley to explain this process. On hearing the explanation it appeared to me that it might be worth while to try the plan, for it was not scientifically impossible. To guard against any doubt however, I wrote to M. Cambon, who in his reply, gave the fullest assurance of his long acquaintance with, and esteem for, the character of the Marquis Courtes. Accordingly it was arranged that M. Verley should demonstrate the process to me, and this was done. I insisted frequently that I was taking no precautions against fraud, because I should myself try the process later after M. Verley had left London. The result as found by Messrs. Johnson and Matthey, was that the solid left me by M. Verley contained 40 grains of platinum per ton, no gold, and merely a trace of silver. I sent this result to M. Verley, who has thought fit to make use of it.

Six experiments, in which M. Verley's instructions were accurately followed by me, show that in no case is a trace of gold, silver, or platinum formed. I have written to the Marquis Courtes informing him of these negative results, and I understand that he has dissociated himself from the enterprise.

PERSONAL.

HON. JAMES BRYCE AND THE NEGROES

The Hon James Bryce, Ambassador of Great Britain to the United States, speaking to a large audience, mostly of coloured people, at Washington said:—

"We must atone for what our progenitors did to you by aiding you in every way and endeavouring to assist you in attaining the highest pinnacle of civilisation and progress. This is not an obligation resting upon any one country, but upon every nation that was instrumental in taking your ancestors from their native lands. England, Germany, France and Portugal all were responsible for taking Negroes to Europe, and it has fallen upon the present generation to stand by the acts of their ancestors and to see that you are properly educated."

SUN YAT SEN ON HIMSELF

The *March Strand* contains a paper taken down from Sun Yat Sen's own lips, which is a statement of his career up to the time of his last leaving England. He says that up to 1885, when he was eighteen years of age, he led the life of any Chinese youth of his class, except that from his father's conversion to Christianity and his employment by the London Missionary Society he had greater opportunities of coming into contact with English and American missionaries in Canton. An English lady became interested in him, and he learned eventually to speak English. Dr Kerr, of the Anglo American Mission, allowed him to pick up a great deal about medicine. He studied medicine for five happy years of his life at the Hong Kong College of Medicine under Dr. Cantile.

On obtaining his diploma he decided to try his fortunes in the Portuguese Colony of Macao. It was then that he enrolled himself a member of the

Young China Party. He failed to secure a paying practice in Macao, and removed to Canton, where he formed a branch of the party. In 1895 he formed a conspiracy to capture the city of Canton, which, however, the advance of Imperial troops frustrated. He fled for his life to Kobe, cut off his queue, and dressed as a modern Japanese. In 1896 he sailed for England, where he was kidnapped at the Chinese Legation and, by the intervention of Lord Salisbury, released at the eleventh hour. He returned to China during the Boxer troubles, and spoke and wrote and lectured on the inevitable revolution. It was then that Colonel Homer Lea gave in his adhesion and became his chief military adviser.

Ever since the Canton conspiracy a price had been placed upon his head. At one time that amounted to £100,000 sterling:—

My most extraordinary experience was in Canton when two young officials came to capture me. I was in my room at night and in my shirt-sleeves, reading and looking over my papers. The two men opened the door. They had a dozen soldiers outside. When I saw them I calmly took up one of the sacred books and began to read aloud. They listened for a time, and after a while one of them spoke and asked a question. I answered it, and they asked others. Then ensued a long argument and I stated my case and the case of the thousands who thought as I did at full length, as well as I could. At the end of two hours the two men went away and I heard them saying in the street, "that is not the man we want. He is a good man, and spends his life healing the sick."

Often asked why, with such a price offered for his head, he went about London so freely and took so few precautions, he answered that his life was now of little consequence; there were plenty to take his place. Ten years ago the cause would have suffered by his death; now the organization is complete. So he adds:—

Whether I am to be the titular head of all China, or to work in conjunction with another and that other Yuan Shi-Kai, is of no importance to me. I have done my work; the wave of enlightenment and progress cannot now be stayed, and China—the country in the world most fitted to be a republic, because of the industrious and docile character of the people—will in a short time, take her place amongst the civilized and liberty loving nations of the world.

POLITICAL.

LORD CREWE AND THE PRESS.

At a meeting of the Calcutta committee of the Institute of Journalists with Mr. J. E. Woolcott, Vice-President and a Past President of the Institute in the chair, the following protest against the Secretary of State's reference to the English newspapers of Calcutta in the House of Lords was unanimously adopted:—

"The committee observe with great regret and concern the following passage in a speech delivered by Lord Crewe in the House of Lords on the 21st February 1912:

'It would have been a regrettable agitation. It might have led—and I myself should greatly have regretted the circumstance, but I should in no way have shrunk from it—it might have led to the application to some of the English papers in Calcutta of the more extreme rigours of the Press Act, which of course might be applied to them as much as to the vernacular Press.'

"While recognising that the English newspapers are in no way exempt from the penalties of the Press Act should they transgress its provisions the committee desire to point out that this Act was avowedly passed for the suppression of seditious writing of a character which led to crime and that the Government of India publicly disclaimed any intention of utilising its provisions to stifle honest criticism. The committee feel that the Secretary of State for India, by referring from his place in the House of Lords to the English newspapers of Calcutta in language which implies that they might be classed with seditious prints which had for their aim the abolition of British rule in India, has brought against loyal and reputable English journalists a charge which they can only regard as a most offensive and unwarrantable libel, the more unfair as it is of a wholly hypothetical nature.

"The committee deem it necessary to point out that in the circumstances Lord Crewe's words amount to a threat to proceed against newspapers which venture to condemn the action of the Government of India and the Secretary of State, and they protest against an invasion of the independence and the liberty of the Press which is calculated to injure public interest and to stifle an honest expression of opinion."

It was resolved that copies of the protest should be forwarded to the Secretary of State and the Prime Minister, and to Lords Morley, Curzon and Crewe; also that the Council of the Institute in London should be requested to support the action of the Calcutta committee.

HOW EMPIRES EXTEND

The state of affairs in Persia, as explained by H. E. the Viceroy, illustrates how empires and "spheres of influence" sometimes extend by the operation of causes practically beyond the control of man. It has been said that the British have made additions to their empire in fits of absent-mindedness. If this statement be an exaggeration, it seems at any rate to be true that conquests have more often been provoked than deliberately sought. While the Anglo-Russian agreement has preserved the integrity of Persia, Great Britain must nevertheless safeguard the lives and property of British subjects. It is not usual to explain to our legislative councils the secrets of the foreign policy, but frankness is sometimes the best way of removing misunderstandings. His Excellency explained that it was not the intention of Government to rely merely on force and on Indian troops for the protection of British and Indian interests, but to open negotiations with the tribes for the punishment of those who attack British and Indian caravans. In other words, the local tribes will be persuaded to hold their own countrymen in check. This is a policy of trust; it leads to friendly understanding, and who knows that it will not lead further? The Abor expedition was a punitive enterprise, with geographical curiosity tacked on to it. Conquests are not worth much in such regions.—*Indian Spectator*.

GENERAL.

DURBAR CROWN.

Replying in the House of Commons to Mr Maccullum, Mr. Montagu said that the decision to keep the Durbar Crown in England with the Regalia in the Tower has been taken after full consideration and consultation with the Government of India. One of the most important considerations leading to the decision was the constitutional objection to any course which might be constructed as providing a separate Regalia for India, and so derogate from the accepted fact that the King of England is crowned Emperor of India when crowned in Westminster Abbey.

GOVERNMENT RESOLUTIONS

The supplement to the *Gazette of India* contains the following resolution:—

The Governor General in Council has with the approval of the Secretary of State, decided that, with effect from the 1st April 1912, the post of Inspector General of Agriculture in India shall cease to exist as a separate appointment. The appointment will in future be combined with that of the Director of the Agricultural Research Institute and Principal of the Agricultural College, Pusa, under the title of Agricultural Adviser to the Government of India and Director of the Agricultural Research Institute, Pusa. The Agricultural Adviser and Director of the Agricultural Research Institute will exercise all functions and powers hitherto exercised by the Inspector General of Agriculture in India and by the Director of the Agricultural Research Institute and Principal of the Agricultural College, Pusa. He will maintain the same position with respect to the Local Government as was held by the Inspector General of Agriculture, as a separate officer, and his duties will remain as defined in this Department Circular, dated 24th October, 1901.

The following resolution is also issued:—

The Governor General in Council has with the approval of the Secretary of State decided that the post of the Inspector General of the Civil Veterinary Department shall cease to exist with effect from the 1st April, 1912. The functions of the Inspector-General, Civil Veterinary Department, will in future be discharged as follows:—

(a) The Imperial Bacteriological Laboratory, Muktesar, United Provinces, will be placed under the immediate control of the Agricultural Adviser to the Government of India, who will occupy in respect of the laboratory the same position as the Inspector General of the Civil Veterinary Department now holds, and will exercise all the powers conferred on the Inspector-General.

(b) The management of the Government Cattle Farm at Hisar will be made over to the Government of the Punjab, and the Camel Specialist will also be placed under the orders of that Government. It will be left to the Government of the Punjab to decide, as regards both the Hisar Cattle Farm and the Camel Specialist, whether they should be directly under the Local Government or under some authority subordinate to the Local Government.

(c) Examinations at the Veterinary Colleges will be arranged by the Local Governments concerned.

(d) The Board of Veterinary Science will cease to exist as a separate Board but some veterinary officers will be appointed members of the Board of Agriculture.

STATISTICS OF DRUNKENNESS IN INDIA.

Sir Herbert Roberts asked the Under Secretary of State for India whether, in view of the fact that statistics as to the convictions for drunkenness are given in the Annual Excise Report for Bengal, representations will be made to the other Local Governments to furnish similar information in their future Excise Reports.

Mr. Montagu: I find that the reports of other provinces with one exception give figures showing cases of drunkenness which have come under the cognizance of the police, though the form of return differs from that used in Bengal. The attention of the Government of India will be drawn to the Hon member's suggestion, in case they should feel justified in imposing upon the Provincial Governments the duty of furnishing uniform returns.

ALONE

BY

Mrs. Sarojini Naidu.

Alone, O Love! I tread the blossoming glades,
The bright, accustomed alleys of delight,
Pomegranate-gardens of the mellowing dawn,
Serene and sumptuous orchards of the night.

Alone, O Love! I breast the glimmering waves,
The lustrous tides of life's familiar streams,
The seas of hope, the rivers of desire,
The moon-enchanted estuaries of dreams.

But no compassionate wind or comforting star
Brings me sweet word of thine abiding-place.....
In what predestined hour of joy or tears
Shall I attain the sanctuary of thy face?

school of economists resented the insular narrowness and self-confidence of the Ricardian school. It took strong objection to the abstract propositions which the English advocates of unrestricted trade laid down, on the strength of the conditions obtaining in their own country. Friedeich List, the leader of this revolt against Orthodox Political Economy, showed that the system of the old school suffered from three main defects: firstly, from boundless *cosmopolitanism*, which neither recognises the principle of nationality, nor takes into account the satisfaction of its interests; secondly, from a dead *materialism*, which everywhere regards chiefly the mere exchangeable value of things without taking into consideration the mental and political, the present and the future interests, and the productive powers of the nation; thirdly, from a *disorganising particularism and individualism*, which, ignoring the nature and character of social labour and the operation of the union of powers in their higher consequences, considers private industry only as it would develop itself under a state of free interchange with society (i.e., with the whole human race) were that race not divided into separate national societies. Adam Smith and his followers as well as immediate Physiocratic predecessors had laid particular stress upon an ideal universal republic and world-wide peace, and taking that for granted, had formulated the abstract theory that under a regime of perfect competition and free exchanges, the only duty of Governments was to keep peace and order in the country. The *one-sidedness* of this doctrine is admitted by the advocates of free-trade and *laissez faire* of the present day, and they have to urge different arguments in support of freedom of competition and exchange. Owing to the peculiar conditions and ideas of his times, Adam Smith believed that agriculture was more valuable than manufactures and home trade than foreign trade and could foresee no danger to his nation's prosperity from free-trade as all industries of those days were in the domestic stage and difficulties of transport and communication were enormous. It is curious to note that like an economist of the national school, he supported the Navigation Laws on

the ground that the defence of a nation is more important than its opulence. Almost all his arguments would be contemptuously rejected by the present-day Cobdenites, his devoted disciples. The world has so vastly changed since his time and were he to come to life again, a writer feels assured, Adam Smith would be immediately converted to Protection. Such seems to have been the influence of the writings of the National School of Economics on the development of thought that those who defend and continue the traditions of the Cosmopolitan thinkers have perforce to admit the force of national considerations and to support their doctrines by showing their beneficial effects upon their nations. Obviously, Cobden's dreams of universal peace have not been realized and in spite of all attempts at international arbitrations and the advance of civilization, we are as far from the millennium as ever. Even List thought that though in the 'forties of the last century, nations were exclusive and jealous, as time went on and with it material progress, the era of universal brotherhood would be hastened. But in the second decade of this twentieth century, seventy years after List wrote, international jealousies are keener than ever, the crushing burden of armaments is painfully oppressing the taxpayers and nations have drawn up cordons of protective tariffs round themselves. The feeling of racial and national division is a powerful force and the economist has to take account of it. The theoretical conception of unrestricted exchange of commodities between nations, and peoples capable of producing the greatest amount of wealth and under best conditions, has its proper place in the science as a theory; but it has to be limited in its application to the world as it is at present. Every state whether it is a continent like India or a world-wide aggregation like the British Empire, whether it is a large federation like Germany and the United States of America or a small empire like that of modern Japan, has its peculiar history, its traditions, its social manners and geographical characteristics, which cannot be reduced to a common denominator and have therefore to be treated *differently*. Nations cannot be governed by purely economic principles.

than public opinion in India. Being a mere dependency, this country's natural resources cannot be conserved and utilized in the interests of and by the people of the land and have to be thrown open to be worked up by European capital and enterprise. Being backward in every particular, Indians cannot tap indigenous resources themselves and they are not being trained for the purpose as they should be. If the Government of India were perhaps left to itself it may be able to do much more than it actually does. In the famous despatch of 1903 relating to the Government of India's opinion concerning preferential tariffs, Lord Curzon observed — "All past experience indicates that in the decision of any fiscal question concerning this country, powerful sections of the community at home will continue to demand that their interests, and not those of India alone, shall be allowed consideration." Speaking in the House of Lords on May 21, 1908, His Lordship said:—"What has been our experience in the past in India of the manner in which the influence and power of the Secretary of State, as the ultimate ruler of India, are exerted in the direction of the fiscal policy of India? It is that in fiscal matters the Government of India has to take the views of the Secretary of State whether it agrees with them or not, and those views are more likely to be guided and shaped by English than by purely Indian considerations." It is not the Liberal party alone that is a sinner in this respect. If the tariff reformers and the protectionists are able to carry their point and come into power in Parliament, they will force upon the Government of India a policy which fits in with their interests and those of their supporters, whether it is suited or unsuited to the conditions of this country. In this way the political factor, the constitutional dependence of our Government upon the British Cabinet and the lack of popular control in the councils of the state in India, dominate the economic situation and other factors are subordinate to it. Not until the Indian state becomes national in spirit and is in a position to take measures calculated to promote India's economic and industrial progress solely in the interests of the

Indian people, can the hope be entertained that our advance will be on the lines of other progressive nations. Our Government has already started on its journey towards that destination but its pace requires an amount of acceleration which can come only if the springs of action are sufficiently strong and elastic.

Indian Emigration to Non British Colonies

BY

MR HENRY S. L. POLAK.

RECENT telegrams from South Africa, London, and Berlin have focussed public attention, in this country, upon a phase of the Indian Emigration Problem that has hitherto been somewhat neglected. Some consideration ought, nevertheless, to be given to a matter that may, as time passes, involve Great Britain in serious difficulties with Foreign powers, difficulties of which, however, she will, in the main, be herself the author.

Indian Emigration has been of two kinds—free and indentured. Free emigration has existed for centuries, mainly to the East African littoral. The Hon Mr. A. M. Jeevanjee shows easily, in an uncommonly interesting pamphlet that, long before British occupation of what is now known as the East African Protectorate, Indians had not only colonised the coast belt, but had penetrated far into the interior. Indian settlements are to be found right along the East Coast of the African continent, from North of Mombasa to Durban, and they are also to be met with at Nairobi, Blantyre, and the more or less uninhabited parts of the hinterland. Here, as pioneers, they have "blazed the trail" of what is known as civilization, they have pegged out stakes for posterity, they have acquired vested rights, and they have made it possible for the British flag to wave over large tracts of African territory. But they have done more, even, than this. They have redeemed or helped to redeem, lands from barbarism and what, in current opinion, passes for it, for certain Foreign Powers, of which the chief are Germany and Portugal. Let anyone

upon Lord Morley, in 1906, to enlist his sympathies against the Transvaal Registration Ordinance, he reminded the members that it was often easier to protest effectively against the actions of a Foreign Power than against those of a British self-governing Dominion. When anti-Indian action was threatened in German East Africa, a question was asked, in the House of Commons, whether, if this were so, His Majesty's Government would proceed to make effective representations to Germany. No answer was returned and, possibly, none was expected. But it is significant that British precedents are now held up before the Reichstag to excuse, if not to promote, anti-Indian legislation; and the British Government may shortly be faced with a diplomatic impasse that will still further embitter Anglo-German relations, without in the least improving the position of the unfortunate Indians, who have been, indeed, handed over to the enemy by the past follies and weaknesses of the British Colonial office, seduced from the true Imperial standard by the false analogy of the idiotic policy that lost Britain the American colonies. Whilst Dr. Solf does not seem to say, in so many words, that the presence of Indians in the German colony is undesirable to the German Government, one does not need to be a prophet to realise from past South African experience how short a time is required for powerful financial interests to pollute the springs of colonial policy, and what may to-day be undesired, by the interested local German traders, may, in the not distant future, come to be, if it be not already, undesired by the administration itself: and it is hard to conceive that Great Britain will take her courage in both hands, and let fall upon Germany, as she did upon the little, impotent Boer Republic, heavy retribution for the ill-treatment of her Indian subjects.

Indian emigration under indenture to non-British Colonies commenced something under 70 years ago. Not long after Mauritius received her first labour supplies, the neighbouring French island of Réunion applied for and obtained indentured labourers. But abuses occurred, and, as a result, an agreement between Great Britain and France was entered

into, so that proper treatment of the emigrants might be ensured. The agreement proved ineffectual, however, for after a somewhat lengthy period, it was terminated by a notification that Indian emigration under indenture to French possessions was thereafter prohibited. Denmark also indentured upon India for labour, but local economic exigencies compelled her to put an end to the system. The Dutch colony of Suriname, adjacent to our own colony of British Guiana, is the only foreign territory that to-day enjoys the privilege of drawing upon India for its contract labour, in competition with British colonies.

It would now appear, however, that the Chamber of Mines, at Luederitz Bay, in German South-West, Africa, is much exercised, owing to local labour difficulties on the diamond-fields, and as the unscrupulous horde of needy adventurers that resort to these glorified gambling hells are fearful of not getting rich sufficiently quickly, with a minimum of personal expenditure of energy, it is announced that steps are to be taken by permission of the Government of Damaraland, we learn on the authority of Sir Edward Grey, to procure one thousand Indian indentured labourers to make up the deficiency. A question on the subject has evidently been put in the House of Commons, for Mr. Montagu has announced that Germany has, so far, made no official proposals regarding the importation of Indian labourers into Damaraland. He added that Lord Crewe was not disposed to encourage any new scheme of indentured emigration from India to places outside the British Empire. Indentured emigration to Damaraland, he reminded the House, was at present unlawful, and could not become lawful unless, the Governor-General of India in Council was satisfied that the country made such laws and provisions as were thought sufficient for the protection of emigrants. In any event, no steps could be taken without an Anglo-German convention making full provision for the emigrants' welfare.

After the very instructive debate, last March, in the Imperial Legislative Council, on the Hon. Mr. Gokhale's resolution calling upon the Government of India to put an end to the system of indentured emigration to

British colonies and Assam (and, therefore, presumably, to the Dutch possession of Suriname), when, apparently upon pressure from London, an official majority defeated the unanimous Indian non-official representation, it is highly improbable that the Government of India are prepared to recommend any extension whatever of the pernicious system of indenture—certainly not to the advantage of a Foreign Power that, even to-day, is contemplating the harassment of Indian subjects of the British Crown resident or domiciled in another of that Power's territories. Having found it impossible to ensure good treatment for Indian labourers in British colonies, where His Majesty's Government can exercise some sort of control, it is extremely unlikely that the Government of India will so stultify themselves, especially after their French experience, as to hand over their proteges to the tender mercies of those over whom Great Britain can exercise no possible control. Moreover, Germany's labour record is not a very alluring one. It will take a long time to rid one's palate of the unpleasant flavour of floggings and other forms of brutal ill-usage of the East African natives by the German Colonial administration of Dr. Carl Peters, who, after having been cashiered, has recently been carefully white-washed, and it is common knowledge in South Africa that the Damaraland native revolt, three years or so ago, was precipitated by the combination of military and civilian brutality practised systematically upon an already brutalised and exasperated people. The German Colonies are the happy hunting-ground of the military "waster," the civilian adventurer, and the commercial vulture of the most rapacious type and of cosmopolitan origin. It would, accordingly, be highly injurious to place the safety and welfare of Indian contract labourers in such hands as these.

There lurks, however, still a hidden danger, arising out of this proposal. The German financiers and speculators directing the Luederitz Bay Chamber of Mines, recognizing the impossibility of procuring labour direct from India, may attempt to seduce Indians from Natal, and in this they will but follow the old-Portuguese precedent of five years ago.

In 1907, when an English firm of contractors failed to secure an adequate local labour-force to build the Benguela Railway from Lobito Bay to Katanga, it took advantage of the great poverty and distress at the time prevailing amongst the free Indian population. This extreme destitution arose directly out of the two serious grievances. In the first place, many of the ex-indentured labourers were head over ears in debt to the Natal Government, owing to the accumulation of arrears of the £3 annual licence, and the law prohibited the employment of any Indian whose licence-payments were in arrears. In the second place, all these Indians had lost their right of a free return passage to India, not having availed themselves of it immediately upon the expiry of their indentures. There was thus a large floating population of Indian unemployed, who jumped at the chance of securing what promised to be remunerative employment in a country where every prospect (according to the labour-agents) pleased, and not even man was vile. Negotiations were entered into with the contractors, under the supervision of the Natal Government, with the sanction of the Imperial and Indian Governments, and, as a result, over two thousand Indians went to Lobito Bay, on two years' contracts, terminable in Natal. This was an important point, because many of them left families behind, and Natal was familiar to them, whereas Benguela, was not. Time passed, and complaints of shocking treatment commenced to circulate, at first secretly, but afterwards openly, and ultimately the contractors, after a year's trial decided to bring the experiment to a conclusion, after, however, the alleged disappearance, by death or desertion, of several hundreds of the Indians. No inquiry seems to have been made regarding this strange phenomenon by any of the Governments concerned. When the remainder were brought back to Durban, the principal Immigration Restriction Officer conceived a brilliant plan for ridding Natal of an appreciable portion of its non-indentured Indian population. He advanced the remarkable objection that large numbers of these people (not ordinary immigrants, be it noted) were ineligible for entry, under the immigration laws of the Colony, as

they had not completed three years' residence therein, their period of indenture not qualifying them for a declaration of statutory domicile. It was urged that, whatever might be the strict letter of the law, these people had been induced to leave Natal by the Government itself, on a two years' contract, terminable in the Colony, and that, in any case, several of those on board claimed statutory rights of domicile. The President of the Natal Indian Congress sought permission to interview the men, but this was refused "in the interests of the people themselves." Without, therefore, their having been able to approach the Courts, these victims of foul-play were deported to India, in many cases leaving their families behind unprovided for. Neither the British nor the Indian Government appears to have demanded an explanation of this scandalous breach of faith.

It is, of course, possible that these things are not likely to happen again. Economic conditions in Natal are not to-day quite what they were in 1907, especially since the flow of labour from India has ceased. Nevertheless, the heavy incidence of the £3 annual tax may throw great temptation in the way of unwary Indians, and may again be used by the Natal administration as a means to get rid of a further portion of the free Indian population of the Province. Damaraland is nearer British territory than Lobito Bay, and, in many respects, Germany, has a better reputation amongst civilised peoples than Portugal. But we cannot forget what has been allowed to happen even in civilised Natal; and there is no need to invite similar injury to Indian national self-respect from an alien Power. In the face of German threats against the Indian traders of East Africa, it is intolerable that German industrial exploiters should receive the advantage of Indian labour, whether from India or from South Africa. Yet more intolerable is the impertinent suggestion that, because Great Britain has accepted restrictive legislation against the Indian subjects of the Crown contemplating emigration to British colonies, Germany is, therefore, entitled to follow suit in her Dominions. It is intolerable, not so much that Germany proposes to

do this, but that Britain should have led the way and largely tied her own hands in any future negotiations on the subject. The Colonial Office was warned years ago of probable results of the false step taken in South Africa. But the Imperial Government refused to take heed. Germany has not hesitated to pour contumely upon the millions of His Majesty's Indian subjects. Nor should His Majesty's Ministers delay to make it plain to Germany that she cannot be permitted with impunity to injure any of the peoples that the British Flag protects. Meanwhile, the Imperial Government should be reminded by this unfortunate incident that practice is better than precept, and that the best method of argument with any other Power, is to refrain from offering an evil example for its imitation.

INDIANS IN EAST AFRICA.

BY

THE HON. MR. JEEVANJEE.

When, a few weeks ago, I published my little pamphlet "An appeal of the Indians in East Africa" describing in detail the various disabilities which my countrymen there are labouring under, I little dreamt that I should be called upon so soon to protest against a piece of proposed legislation of the Government of East Africa, highly unjust and injurious to the interests of the Indian Community residing there. I learn that the Government have on their legislative anvil a bill for imposing a poll-tax indiscriminately on all the "non-native" population in the Protectorate and that it has been even read a second time. Shortly put, the bill contemplates a levy of Rs. 15 annually from every "non-native" male of eighteen, whether he be rich or poor. The term "non-native" in the bill means all outsiders including the Europeans and the British Indians. So, if the bill be passed into law, as it probably will, considering the present constitution of the Legislative Assembly there, every male British

Indian in East Africa shall have to pay Rs. 15 on every April 1st. In default of payment, the defaulter is liable to be prosecuted, fined and even imprisoned. Not only that, his property will be attached and sold, if necessary. But into the details of these I need not enter here.

Now it is true that this bill professes to make no invidious distinction between the Europeans and the Indians, and the Indians, therefore, have no sentimental ground to oppose the bill. But when we remember that the number of British Indians affected by the levy of this new tax is nearly 25,000, while the Europeans can count scarcely 2000, it will be clear that, in effect, the whole brunt of this tax will fall on the Indian section of the population and it is the Indians alone who will have to pay by far the largest portion of the proposed tax.

Again, most of the British Indians in East Africa are labourers and artisans and their monthly incomes vary from Rs. 15 to Rs. 45 only, whereas the Europeans form a wealthy class; they earn fat salaries. To the latter a yearly payment of Rs. 15 is not a burden. But to an Indian, whose monthly wages do not amount to more than Rs. 20 or 25 (the number of such Indians is very large) a Poll-tax of rupees 15 means an unmitigated hardship. I cannot do better than quote from a memorial, submitted to the Governor of East Africa by the British Indian Community, protesting against the proposed Tax.

"In the first place we would state His Most Gracious Majesty rules over no subjects more dutiful, more faithful or more law abiding than our humble petitioners, and that we fully recognise it a duty incumbent upon us to bear a fair share in the cost of the administration of the Government of this Protectorate. In times past, we and our fathers before us have done our duty in opening up and developing the country and thus it is not now our desire to shirk responsibility in the future."

It will be noticed that while protesting as they do, emphatically against the Poll-tax, the British Indians are not willing to pay any other reasonable and equitable tax, that Government may levy. The Memorialists further urge:—

"Your Excellency needs not to be informed that the British Indian Community is at least ten times more numerous than all the European population combined so that consequently, our fellow countrymen would have

to pay a greatly heavier percentage of the proposed tax and thus, although we are denied equal rights and privileges as enjoyed by other communities."

"If wealth were equally distributed among all the members of the non-native population this might not be inequitable, but it is unnecessary to argue that such is not the case for it is a well known fact to Your Excellency, that the large majority of British Indians in the Protectorate are drawn from the poorest classes consisting of labourers and artisans, a class of the greatest importance at this time to the country while on the other hand among European population few are to be found belonging to this class."

It is needless for me to say how odious and unpopular the very name of Poll-tax is. It has got the most unsavoury historical associations. It at once calls to our mind the names of Richard II, and Wat Tylor the rebel, of Aurangzeb and his *Zaria*. Historians, ancient and modern, have with one voice condemned a capitation tax levied in any country and in any time. Indiscriminate taxation is always fraught with possibilities of a serious mischief and cruel oppression on the population concerned. In East Africa, the Indians are already struggling against the grave difficulties and disadvantages, resulting from a policy of unequal treatment and colour distinction. But this atrocious measure, if passed into law, will further reduce them to a state of utter poverty and starvation. It is understood that the 3rd reading of the bill has been postponed till the next session of the Council, probably in deference to the opposition of the European community, who oppose the bill on the well-known principle of "no representation, no taxation." They refuse to pay the tax, which is levied by a Legislative Council, where their interests are not represented. The Indians, too, have got the same ground to oppose the bill; though in addition to it, they plead inability to pay such a heavy tax. I hope the East African Government will realise the disastrous consequences with which the bill is fraught and will drop it like a hot potato. It is a measure which is unpopular both with Europeans as well as the Indian element of the population. Its introduction has caused widespread unrest and deep anxiety among the Indian community. It will lead to a strenuous opposition on the part of the people in future.

BABU KRISTO DAS PAL.

(An Appreciation.)

BY

MR. M. VENKATASUBBAYYA, B.A.
(Of the Servants of India Society)

INTRODUCTION.

IT would always repay to peruse the life of Babu Kristo Das Pal, the greatest of Indian journalists. It is of special value now in the days of the Press Law and the Seditious Meetings Act. It teaches the people that one can be the respected friend and trusted adviser of the Government while being a severe critic of its measures. And it teaches the Government that criticism is not necessarily synonymous with sedition. Babu Kristo Das Pal was often a severe critic of the Government; but he was always consulted and honoured by the Government; and he was rightly called one of the "Pillars of the Empire." An irritable Lieutenant-Governor (Sir George Campbell), once called his journal disloyal, because it criticised certain measures of the Government which interfered with the rights of permanent settlement and the cause of higher education. Kristo Das addressed a spirited and effective remonstrance which evoked only praise on all sides. He distinguished the executive from the constituted authority and quoted the case of the opposition in Parliament. "Loyalty does not mean the recognition of the English as the dominant caste in India; nor does it mean the submission of individual Indians to individual Englishmen; but it means allegiance to the British rule and respect for the law."

BIRTH AND EDUCATION.

Kristo Das Pal was born in 1838, of very poor parents and in an humble caste called the *Telee*. He began his studies in the Bengali section of what is now known as the Oriental Seminary, where his progress was marked and he obtained the prize of a silver medal. In 1848, he joined the English section, and here also he gave proofs of intelligence and industry.

He left the school in 1853, and read for some time under a missionary who could scarcely instruct him from any other book than the Bible. He then became a member of the "Calcutta Literary Free Debating Club," some other members of which and himself organised a "morning class." It used to receive instruction first from the Rev. Morgan, a distinguished teacher of youth, and then from Dr. George Smith, who edited the 'Friend of India.'

"He used to get up at 4 o'clock (in the morning), visit his comrades and proceed with them to attend the lectures. Many of his comrades became tired of the early journey; but Kristo Das was made of different stuff; his zeal never flagged."

After attending this morning class for two years he joined the Hindu Metropolitan College, of which he was one of the earliest students, and had the advantage of reading with men like Cap. D. L. Richardson and others, who were all distinguished scholars, all interested in the cause of education, and all moved by the warmest sympathy with the people of this country and their pupils in particular. In 1857, that is, at the age of 19 he left college and commenced his worldly career.

EARLY ACTIVITIES.

While yet a student he took a lively interest in politics and possessed considerable skill as debater. He was the moving spirit of the Club already referred to, and by his unwearied efforts raised it to a higher position than that of any similar association of young men. In one of its meetings Dr. Alex. Duff was invited to preside. Young Kristo Das happened to differ from the reverend Doctor on some points, and he stood up and boldly expressed his dissent. Kristo Das was a born politician. After the Mutiny was suppressed in 1857, he suggested to his Club that they should send their congratulations to the Government through the British Indian Association. He drafted the letter and took it to Raja Issur Singh, the Secretary of the Association, who was highly pleased with the letter, thanked the Club for its valuable suggestion and promised to carry out the proposal speedily.

tabulate results, to advance arguments, to cite authorities, to expose inconsistencies and detect fallacies, he was in his element. He used the simplest forms of expression but avoided colloquial vulgarisms. He employed but little the arts of rhetoric in his maturer years. His style was lucid, logical, unpretentious."

There was no affectation about the man or his style.

AS SPEAKER

Kristo Das Pal was a born debater, and he had several physical advantages in addition. He had a stately presence, a clear full toned voice, and he was master of the art of elocution.

"He spoke with calm dignity and logical precision, and never employed unfair methods of warfare. His speeches like his writings produced their effect not by tricks of rhetoric but by the abundance and accuracy of the information they contained and by the arguments they set forth."

His English hearers were unanimous in considering him as one of the best speakers of India. Indeed his speeches could compare in all respects with the better sort of Parliamentary speeches. His fluency and skill were often the envy of Englishmen of culture. But among his own countrymen he does not seem to have had the same reputation for powers of speaking. We generally appreciate the emotional kind of oratory better than the argumentative; the speech of the demagogue better than that of the senator. We do not see quiet humour, or when a speaker makes a point; but violent declamation, scathing sarcasm, broad jokes, the elaborate demolition of an argument with pomp and circumstance, we fully appreciate. It is perhaps on account of our strange lack of humour and the absence of cultivated taste that we not only suffer but applaud the extravagant speeches, exclamations and "ye Gods" of our speakers at Temperance and other conferences, in the former of which, by the by, most of the listeners have never tasted drink, nor are ever likely to taste.

POLITICAL LEADERSHIP AND WORK.

Kristo Das Pal came to be recognised as a political leader of Bengal, not because he had the required mental and moral qualities, but because he was the editor of a zemindari paper and Secretary of a Zemindari Association, and because he had influence both with wealthy men and the Government. But this would not have been enough if he had not 'an indifference to new ideas,' for our people are essentially conservative, despondent and lacking in enthusiasm; and we demand these qualities in our leaders also. And he should have failed if he had not refrained from all attempts to thrust himself on public notice. His opinions were not the result of an assimilated system of thought. They were formed in each case with a view to practical utility, and for that reason they appealed to the English mind. When he lived the Indian National Congress had not come into existence, and the political ideas of the country had not crystallised into definite shape. It is almost needless to say that Kristo Das Pal would have identified himself with its opinions and aspirations. As things were, he urged incessantly the fulfilment of the promises contained in the Proclamation of 1858.

Speaking of the aspirations of young men of respectability and position to enter the Army, whereto in 1877: "The only objection that can be urged against the measure is a political one. It might be thought impolitic to train ambitious members of a subject race in the art of war and place them in command of regiments and battalions, but the policy which proposes to govern a subject nation by distrusting and degrading them is a narrow one, utterly unworthy of the august Sovereign under whom we live. Confidence begets confidence and we have no hesitation in saying that the confidence of Her Majesty will greatly strengthen her rule." In the same year, when the Indian Cotton Import duties were partially abolished, he said: "Under the operations of the English interests the cotton and piece goods trade of India has gone. There is now a faint glimmer of a hope of revival, and English

interests are again in the way of India's success. We gratefully acknowledge that Indian commerce has greatly developed under British rule, but whenever English interests have come into collision, the people of India have gone to the wall." "Our countrymen," he said, "should be up and doing."

His work is not known by any conspicuous monument. It consisted of the guidance of public opinion and of the vigilant and efficient criticism of public measures. Being an Indian he was given no chance for initiating measures; he was only consulted. Such work does not generally attract men's attention; but all careful students of the lives of men and nations must acknowledge the importance of work which is rather critical than constructive, and whose results are subtle and impalpable rather than concrete and tangible. It should be remembered that Kristo Das Pal is the father of any real journalism that may now exist in Bengal.

Kristo Das was ever watchful of public rights and those of the Zemindars in particular. But, says the late Mr. N. N. Ghosh, we do not ever see him reminding them of their duties, either towards themselves or towards the poor ryots under them. It is to be regretted all the more since no man had greater influence with them than Kristo Das Pal. When the Bengal Tenancy Bill was introduced, however, he expressed in the Imperial Legislative Council his sympathy with the millions.

GENERAL CHARACTERISTICS.

Sir Stewart Bayley, who afterwards became Lieutenant-Governor of Bengal, said of Kristo Das Pal :—

"What were those peculiar qualities which enabled him to attain, and to maintain during all his life, an absolutely unique position, not only in the admiration of his countrymen, but in respect, regard and affection of all, of whatever nationality, who came in contact with him? Well gentlemen, I cannot pretend to offer an adequate explanation. In the course of the twenty years of my acquaintance with him I think the qualities in his character

which principally struck me were—first the admirable balance of his judgment; and, secondly his thorough sincerity. By sincerity, I mean not only moral sincerity, which is the duty of every good man, but I mean also mental or intellectual sincerity—that quality which makes you feel, in talking to a person, that his opinion is the outcome of an independent mind, and not merely the outcome of foregone prejudice or passion. To those qualities I may add a third, which has already been alluded to, and that was his unflinching temper. As I say, I have known him for twenty years, and have never failed to admire the extraordinary self-control with which, whether in fighting a winning or a losing cause, and especially in the latter, which is far the more difficult of the two, he never for an instant forgot himself, never said anything which he need be sorry for."

All these qualities are very clearly reflected in the columns of the "Hindoo Patriot." Indeed, but for them it was not possible for the paper to command the attention and wield the influence that it did. He never resorted to unworthy arts to secure public patronage. He was uniformly sober and candid in criticism and never consciously unjust. But perhaps we should admire him most for his temper. He was often vilified or abused by persons or classes for whom he could not procure official favours or whose cause he could not support. But even in dealing with the most dirty tricks of the opponents, he never lost his temper, never forgot himself. It is to the ever-lasting credit of Kristo Das Pal that he was almost the only conspicuous man that did not lose the balance of his mind over the Ilbert Bill. It was a time when the whole country was in a frenzy, when Englishmen and Indians gave hard blows to each other and neither would listen to compromise; when even in the Council Chamber a kind of language was used which can hardly be read now without a blush. We print as Appendix the three speeches that he made in connection with that unfortunate Bill. They must remain for ever a model of sober and, dignified language, clothing the most exalted ideas of statesmanship and the most fervid sentiments of loyalty.

The balance of Kristo Das's mind is splendidly brought out in these speeches, especially in the first one where he expresses his firm belief in the ultimate triumph of the British sense of justice. In this weak world, passion and prejudice often get the better of us; and it is a great thing to act with a keen sense of justice. But it is a greater thing not to lose the balance of our mind for a single unjust act, or even a succession of several such ones.

HIS MODERATION.

We here are in the habit—recently more so than ever—of appreciating a journal or its editor in proportion as it indulges in violent language. What is most out of taste, what is most irresponsible, appeals easiest to our imagination. Therefore it is no wonder that the moderation of Kristo Das Pal was much disliked by many men. They attributed to him a want of independence which they said was due to his over-anxiety not to offend the authorities. The charge was absolutely unfounded. All officials knew him to be the most uncompromising controversialist. He was judged then as some of our leaders are judged now.

"His moderate tone was the result of his anxious desire to be just. He was personally acquainted with many high officials of his day and knew that they and their actions were very often misunderstood. When he came to sit in judgment over them he was careful to see that they had a fair trial. He happened to know very often the facts which would put him in an attitude of sympathetic criticism, and knowing all the grounds of defence he could not be keen in his attack. (It is ignorance which sharpens the edge of criticism. Correct criticism must be well-informed, but such criticism is disagreeably sober to the impulsive student of politics; smart, sensational criticism is highly prized by the majority of readers, and such criticism derives its main strength from ignorance.) Kristo Das Pal studied every important public question so thoroughly in all its aspects, he knew so much of the men who decided the fate of questions, that he could not, like the mob, take always

the most uncharitable view of men and measures, or judge them only by appearances."

On the other hand independence was a strong trait in his character.

In 1877 when the title of Rai Bahadur was conferred on Kristo Das Pal, he acknowledged the honour in the following terms in the *Hindoo Patriot*: "We are not a little surprised to find our own name among the Rai Bahadurs. If we may be allowed to be light-hearted on such a solemn subject, may we ask what dire offence did we commit, for which this punishment was reserved for us. We have no ambition for titular distinctions..... We are certainly grateful to the Government for this token of appreciation and approbation of our services, but if we had had a voice in the matter, we would have craved the permission of our kind and generous rulers to leave us alone and unadorned, following the footsteps of those honored, illustrious Englishmen, by whose side we are but pigmies, who have preferred to remain without a handle to their names."

We are a little puzzled, however, and cannot understand why he did not refuse the honour if he was in a mood to write the above. In passing, it may be said that in his later years his position was so high and his influence in society so great that, instead of his courting official favour, there was every reason for the highest officials to seek his support.

Among his other characteristics were a tenacity of purpose and prodigious industry. It has already been observed how in the face of strong temptations he stuck to journalism. And those who know the conditions of Indian journalism will easily understand how much industry the editor of an Indian daily newspaper is required to possess. The editor is, with us, the greatest part of the staff.

"From early morning till a late hour in the evening, he had to receive visitors, most of whom wanted some favour. Latterly he had acquired the art of writing his articles and doing other work in the presence of his visitors and while talking to them.

(If he had thought of waiting till his visitors

had left him, he would have had to wait for ever.")

The late Mr. Justice Ranade was similarly forced to go on with his writing and other kind of work while talking to others.

"The afternoons he used to spend in the rooms of the British Indian Association. Even there the visitors pursued him. A great deal of his work had to be postponed from day-time to night-time, and he hardly ever went to bed before one or two in the morning.

"Kristo Das had not only to write his paper unaided, but to write all documents for the British Indian Association, and to write minutes as a member of the Legislative Council and of the committees on which he might have had to sit. He also wrote petitions for men who came to him with grievances."

EXCESSIVE DOMESTIC TENDERNESS.

In domestic life he was tender almost to weakness.

"He could hardly separate himself from his home for a single day without a pang. If business or the demands of health took him away from Calcutta even for a short time, he would insist on being written to every day about the state of affairs in his home. On one occasion he had taken a short holiday and retired to a quiet place at some distance from Calcutta, where he used to receive letters every day from his son. One day no letter came. He immediately made up his mind to go back to Calcutta, and left the place the same day. The slightest ailment of a child filled him with anxiety and even drew tears from him."

PRIVATE LIFE.

His life was very simple, his wants few and his habits unaffected. Indeed his style of living was not altogether suited to his position. If he had adopted a more comfortable mode of living he should have perhaps enjoyed better health and been spared longer for the service of his country.

"In the widest sense of the word 'pure,' Kristo Das's life was of the purest. And his virtue was not merely of the negative sort, but

was largely identified with active beneficence. He gave relief, to the best of his power, to needy and distressed individuals, and also helped the public through organised institutions of charity as the District Charitable Society of Calcutta."

He had great powers of conversation and was genial and lively. But he maintained a degree of reserve with regard to more important matters, especially of a personal sort; and not more than three or four knew the details of his private life and had looked into his heart and soul. He had respect for seniors and no jealousy for young men. He helped them whenever he could. His own success had been viewed with jealousy by many men; but his nature was not soured by this bitter experience. *He exercised a feeling of "Let bygones be bygones" which was a constant saying with him.*

"He was kind and courteous to all, even to menial servants. No man was ever repulsed from his door, or heard from him an unkind word, even in the midst of the busiest of his occupations and the sorest of his trials. In his home he was never tyrannical, in society he was never disagreeable. If he possessed authority, he neither stretched it, nor exercised it in its full measure. (Like Englishmen and unlike Bengalis, he had the art of enjoying power and not seeking constant opportunities of its exercise.) He was so mindful of his duties that he never cared to insist on his personal rights as against friend, relation or subordinate. (Therefore he was not a pest to his subordinates, nor a bore to his friends and colleagues.) He was not self-assertive and dogmatic, and would not threaten to resign if his counsel were not followed."

Kristo Das lived and died a Hindu; but he was keenly aware of the evils that are devil-talising us. Like most educated Indians he had an enlightened toleration for men professing other religions. He had no hatred to the work of the missionaries where their methods were not objectionable. Though he mixed freely with Europeans he never dined with them; and he advocated only such intercourse between the two races; he was convinced of

"How did you live alone without father? There, mother, do not be crying like this. I shall stay out a year at the most. Do not become sick for my sake during that period. I shall request our neighbours and my friends to look after you and give you help when you want any."

The next morning Bapa started from Nagendrapura. He entered a forest on his way to hunt there. He never shot harmless animals like the sheep and the deer, or noble animals like the lion and the elephant; only the hard-hearted tyrants of the tiger kind were his game. As he was searching for such, he saw in front a huge tiger speeding towards him. He may miss his aim—he thought it, therefore, unsafe to shoot from the ground. Quickly he climbed up a tree hard by, and comfortably sat amidst the branches. The tiger came to the tree, looked up, and growled fiercely. Now it ran round the tree, then tried to climb; now it crouched on the ground, then growled all of a sudden; now it seemed to go away, then turned back and jumped high to reach the branches. Bapa shot two arrows, but missed the mark; for the tiger was restless and moving all the while. Seizing an opportune moment, he sent the third arrow which pierced its head and laid it down. He had heard of the feinting tricks of tigers, so he shot another arrow into the same place. Still, he could not be sure whether it was really dead or not. So he made up his mind to wait for a time. Reclining against a big branch, he began to turn his eyes on all sides of the forest below. After a time he saw a man going along, whom he recognised as a hermit and hallooed to him.

"Mahatma, I shot this tiger with two arrows and it fell. I doubt to come down, because I think it may be living, and lying in that manner to pounce on me the moment I come to the foot of the tree."

"You need not doubt, child, it is dead. You may get down if you like."

Bapa got down and followed him. As they walked along, he asked the hermit many questions to which he promptly replied.

"Where do you come from, and whither are you going through this forest?"

"I come from the town, and am going to the next village where my house is."

"And who are you?"

"You see I am a sanyasi."

"Why did you become a Sanyasi? You are so strong and so fair-looking."

"Child, why do you want to know this? Is it of any use to you?"

"Mahatma, please do not get angry that I am asking you many questions. For mere pleasure I want to know these things."

"I became a Sanyasi for mere pleasure."

"You are smiling. I do not think you are a Sanyasi."

"By all means, do not."

"Perhaps you know Mantras?"

"Yes. Hundreds by heart."

"Again you are smiling. Mother too does not think much about Mantras. Are you skilled in archery?"

"Yes."

"You know how to put people into sleep?"

"Yes."

"Can you control your breath?"

"Yes."

"For days?"

"Yes."

"How can that be possible?"

"That it is possible I can assure you. But how, I can neither explain now nor you understand."

"Can you fly in the air?"

"Yes, if I can become a bird."

"How can you become a bird?"

"Then how can I fly in the air?"

"You are joking. Mahatma, please tell me the truth."

"True I was joking, but I was also telling the truth. If you are willing to believe, there will be many people ready to come forward with all kinds of absurd fictions."

"Can you tell of things that are past?"

"Yes."

"Then kindly tell me who I am? My mother says I am a gopa boy, and people say I must be a Kehatriya."

"What is your belief?"

"I believe I am a Kehatriya."

The Sanyasi told him his real history, and also the histories of a few of his ancestors. Bapa was awayed with emotions; now he was bright and all smiles, then pale and full of tears.

"Mother ought not to have hidden the truth from me. By this time I would have gone and killed Nausarvan the cause of my father's death."

"You are youthful and hasty, and do not know. You should not find fault with your mother. What she did was right."

The Sanyasi explained, and Bapa was satisfied.

"Now, Chandrasena, you may go."

"No, I shall come with you as far as your house."

"My house is here only. Now I must go."

III.

THE QUEEN'S DEATH.

Soon after Bapu left home his mother gave up crying, now thinking of his brave deeds, and now remembering his brave words at the time of his starting. But as month after month passed and still he did not return, she began to fear and doubt. Sometimes she would say to herself: "I do not know whether I shall see my Chandrasena. I cannot know where he is. I cannot know even whether he is living or not. A tiger or some other wild beast may finish him. Or envious persons may secretly murder him. Or the Persian enemy may capture and hang him.... But away with these terrific thoughts. He promised to be very careful not to run into danger. Perhaps he is living and I am giving myself up to merely foolish fears. What a sad lot I created for myself! Oh! Why did I let him go?" Day by day her sadness grew. And at a time when she was most sad, her dear son came back to her. She called him Chandrasena, for he told her as soon as he came, that he learnt his true history from a Mahamuni.

"All you did was for our good only. But we need not think of the past. Only of this we must think—we shall not live here any more. I shall take back my kingdom."

"You are only ten years old my boy. You are still too young to rule an empire. You have to learn many things."

"Mother, do not fear I am too young. I have learnt the many things you think of, and more other things from the Mahamuni."

He gave an account of what he did in the Mahamuni's Asrama, and showed the diamond. The queen said: "Now of course I need not fear, you may go and sit on the throne, and begin to rule."

That night and the next day he entertained his mother with a detailed account of his year's life. At about bed-time he opened the subject of his starting for the capital.

"Mother, we shall start to-morrow."

"No child, you alone will go. I want to stay here sometime longer."

"Why here? You will come to troubles here, when it is known who you really are."

"And do you think I shall not come to troubles, wherever I may be? People, as you have heard, are cursing the Persian, because, it seems, he has been making enquiries and searching for me."

"Yes. For this reason too, you must not stay here. Living with me you will be safe. As for the Persian, I shall kill him as soon as possible."

"Chandrasena, my dear, you ought to have guessed my intention, and as you did not, I shall not hide it any more. As soon as your father died, I would have put an end to my life, but I had to live for your sake. Now you are grown up and fit to wear the crown. So I shall not live any more."

Tears stood in his eyes, he buried his face in his mother's lap. Then he looked up.

"Mother, you brought me up so kindly and lovingly. You cried so much to leave me for only one year. Are you going to leave me for ever?"

Tears were running down his cheeks; the mother also was weeping bitterly.

"Do not cry, dear. With your father all things became dead to me. I lived as long as I could be of use to you."

"Is there a time when you will not be of use to me? Only this you will lack, namely, father's presence. For the rest, you will have everything as you like. You will be looking on while I reign."

"What is the use of my living? For me, the Persian will often come against you and trouble you. Whereas, without me, you will be left undisturbed to rule your kingdom in peace."

"Mother, what is the kingdom to me, if you must die? Did I ever hope I would get a kingdom?"

"I must tell you one thing more. A few minutes before your father died, I told him I would fight the enemy and die rather than ever yield. He entreated me to live somehow or other for your sake. I told him I would live till you came of age and then die. He gave me his consent. And now that time is come."

"I was a fatherless child till now. And you are determined to make me motherless also. Mother, I too shall kill myself."

"Dear boy, you are clever and wise and have learned many things from the Mahamuni. Calmly think over the whole matter. For your sake and chiefly for my sake, I must die. Whereas you must not kill yourself, because you are the Emperor, and because you are the only son of a renowned family. Now hear me. Go to the Prime Minister and say you are Chandrasena, and he will tell you everything."

She described to him the arrangements she had made. He was fully impressed with the belief that his mother would not give up her resolve.

Thoughts of his future lonely life came into his mind; they gave him pain, so he sobbed and wept.

"From your childhood you have been giving justice. Therefore I need not tell you how you should act as emperor. I have to tell you just these two words. Be merciful to your enemies and be great like your ancestors."

She remained silent and went to sleep.

Chandrasena feared she would not live till next morning. He resolved to keep awake all night and watch her. But he could not, for he was weary with crying, and also there was his mother's strong will working. He fell into a slumber. At dead of night he was suddenly roused by a noise, which he understood at once. There was his mother bleeding and writhing on the ground, with a dagger plunged into her heart.

"Ah! Mother! Mother! After all you have deceived me. I thought I would be able to prevent you. Ah! How soon could you forget your love for me!"

"Forget? No, no." She was in tears.

"O, how I used to amuse myself with fancying that, with your own hands, you will perform my coronation and marriage festivals!"

"Father and I made a big plan," she said, crying through her pain and agony, "the Persian spoiled it all."

"I shall go and kill that wretch."

"Yes, you shall." She was not prophesying, but she knew her son's ability.

"Chandrasena, come let me kiss your child. There, do not cry, my dear. Pull out this dagger, it is paining very much."

"Mother, I shall stab myself with this."

"Will you do a foolish thing, my boy? Remember my words."

She felt relieved as he pulled out the dagger.

"See me buried in your father's grave. Live and bring fame to your house."

She shut her eyes, and gave up the ghost.

Chandrasena deeply mourned her loss. In the morning, some policemen who hated him came to arrest him on a charge of murder. The neighbouring Gopas scolded them, told them what happened, and sent them away. At the time of burying the queen, they again gave trouble, objecting that the Emperor's grave should not be opened. Chandrasena told them she was the Empress, and drove them away. After a few days he thought of leaving the place. He remembered how, on the first time, he took leave of his mother; and now he lost that mother. With a heavy heart he walked towards Vallabhapura.

IV.

THE YOUNG EMPEROR

About the same time that Chandrasena started for Vallabhapura, the Prime Minister with his eldest son started from that city. Queen Madhusudani had gone to her mother at Vijayapura about eleven years ago and her son must by this time have become a blooming boy of eleven. But he had not yet come, nor was any information sent regarding him. So, the minister thought he must himself go to Vijayapura to pay his respects to his young lord and to bring him to the capital. But when he reached that place, he had a strange tale to hear. The queen's mother, an old woman, began to cry.

"Madhusudani never came here. Very soon we are going to celebrate the marriage of her youngest sister. We were thinking of coming to invite her. She was six months pregnant at the time we came to condole with her. Who knows where she might have gone to and what difficulties she might have suffered!" Conjectures, and doubts, and fears were given up as useless. They must search for her everywhere. Her parents, her minister and his son, her brother, and her sisters formed the party that was to travel in search of the Queen.

There at Vallabhapura, likewise, Chandrasena had a strange tale to hear. "My father has lately left this place for Vijayapura. Indrasena, son of the late Emperor's uncle, is ruling now." So said the minister's second son in whose house he lodged. This story he had already heard from the Mahamuni. The day after the queen left the capital, this Indrasena went thither seemingly to condole with her, but really to persuade her to marry him, so to gain the empire. Going to the minister, for he had heard of the queen's departure, he said "My cousin ordered me to take the keys from you, and to be ruling here till her son attained his proper age." The minister believed him, and handed over all the keys. Now Chandrasena heard that the Emperor would hold an assembly soon. On that day, he sent the minister's son with the following message, to be delivered before all. "You cunningly deceived the minister and occupied my throne, giving out that my mother gave you order to rule the kingdom till I reached the proper age. You lied shamefully. Even if you say you did not lie, the time of your rule is over. I am Chandrasena the son of the late Emperor. You must give me back my kingdom and depart from this place." "Who is this insolent fellow that dares to send me orders!"

said Indrasena, "Let this man be prepared for battle." But he was inwardly much agitated and frightened.

The late Emperor's army was very glad that their young lord was come, for the queen had told these people also that her son would come some day. These soldiers hurried to him, paid their homage, and stood on his side. On the side of Indrasena were the forces which he brought from his own towns. The battle commenced and the foot-soldiers fought for a time. Hundreds of them were falling.

"Let them stop," said Chandrasena, "it is we that must fight and settle our dispute."

"I and my army will fight. On your side you alone must come, for your present army should be mine. Win your kingdom thus, if you can."

"It is an unjust and cowardly proposal on your part. Yet I agree. But still, why should I slay these poor soldiers for your guilt?"

The soldiers were stubborn like their master. They said they would gladly fight for his cause. So Chandrasena could not but kill them. With his powerful arrows and never-failing aim he easily cut off the heads of hundreds of them. They were terrified, thought they would all perish if they stayed longer, and hence submitted and retired from the field. "Now let us fight," said Chandrasena to his opponent. They met. At the very outset Indrasena did an unkingly act. Against rule, he shot an arrow at Chandrasena who was getting ready and was unguarded. The arrow made a big wound in the back, and blood gushed out profusely. Even as his soldiers were bandaging the wound, he called out to his enemy to be ready. With the first shot he brought down that unkingly usurper.

The next day, Chandrasena with the minister's son started for Vijayapura. The party from that place and his party met on the road midway. The old parents kissed and hugged their grand child. All were very glad to hear how he regained his throne. At Vallabhapura he related the story of his mother's death. All shed tears; some felt sorry for Chandrasena; some said she could have tried to live; but finally all affirmed they were proud of such a queen. The next month the coronation was celebrated.

The next year Chandrasena led an army against the capital of Nausharvan. The Persian Emperor was surprised to hear that a mere boy of twelve years led this expedition. On the first day he sent only his army, which Chandrasena defeated and drove away. The Persian was surprised still

more. He sent a message thus: "We shall not in future come against your capital. Nor shall we demand your women. I shall give you my daughter in marriage, and we shall become friends."

"Is he not ashamed to send this message?" replied Chandrasena. He cannot fight with me, and therefore offers his daughter. Does he think I shall marry the daughter of an ignoble house?"

Nausharvan became angry and himself came to battle.

"Nausharvan, old man, you were the cause of the death of both my parents. If your son had not come for my mother, my father would have been still living. And if you had let her alone even then, she would not have given up her life."

The inquisitive Persian heard the story briefly told, and felt sorry for what he had done.

"You instituted a search for her you old fool. She killed your worthless son, and I have come to kill you the worthless father of a worthless son."

Very soon he despatched him with a deadly arrow. The Persian queen discarded her Parda for the time being and came to the battle-field. She cried and said she came to entreat him.

"Maharaj, my son and my husband behaved foolishly and wickedly, and both suffered. I have many children I beg you to pity us and kindly leave us the kingdom for the sake of my boy of ten years, whom I beg you to spare."

Chandrasena came to be revenged only on Nausharvan. He did not want to kill others, nor did he want to annex the kingdom. He stayed in the Persian capital for a few days, placed the boy on the throne, and crowned him Emperor of Persia. He made him one of his great vassals, and imposed a tax to be paid annually as a tribute in acknowledgement of his suzerainty. Praised by all for his victory, praised even by his enemies for his mercy, and praised mostly by the loving minister, Chandrasena returned to his capital amidst great cheerings.

V.

FRIENDSHIP WITH MOHANAKUMARA.

Once in his thirteenth year Chandrasena went out for a hunt. In the forest he saw a prince chasing a deer. He ran quickly to meet him, and just when the prince was about to shoot the arrow, caught hold of his arm. The prince turned round in anger, but suppressed it when he saw

one whom he supposed to be another prince "Prince, why did you hold my arm when I was on the point of bringing down that deer?"

"My friend, just to prevent you from killing it."

"Who are you?"

"My name is Chandrasena. I am the Emperor of Vallabhapura."

The capital of the Rajaputranthan Empire was Vallabhapura; so the ruler of that empire was popularly known and styled as the Emperor of Vallabhapura. The prince thought that he should not disregard the advice of an Emperor even if he be younger than himself.

"And who are you?"

"My name is Mohanakumara. I am the eldest son of the Emperor of Indraprastha."

Indraprastha stood where Delhi now stands. It was the capital of the Vanga Empire and the ruler of that empire was generally called the Emperor of Indraprastha. Though Mohanakumara did not know the fact, Chandrasena knew, from the history of his ancestors, that the two Royal families were connected by marriage ties.

"Friend, why do you kill the poor harmless deer? If, on the other hand, you can catch them, you may play with them."

"Yes. But princes hunt them and kill them for practice and for pleasure."

"True, our Kahatriyas do so. What of that? It is a cruel business. And as a result of all these deeds of our youth, in our old age we generally die miserable deaths on the battle field, pierced and cut with swords."

"Should we then give up hunting?"

"Yes, if we can. If we cannot do so at all, we may hunt wild animals of the tiger kind."

"Then, I killed so many birds too."

"I advise you, if you care to hear me, not to do such things in future. I can aim so well that, if I like, I can kill many deer easily. But I hate to do such a thing. The deer are such beautiful and gentle and lovable creatures."

"Yes, it is a cruel and hateful business as you say. I never thought so before, nor did any one make me think."

"From your words, I believe you will give up this cruel sport we call a hunt."

"I shall certainly give it up. Now I shall take leave. If you like, I shall pay you a visit some day."

"I shall be very glad."

Then the young prince and the young Emperor parted. They became sufficiently acquainted with each other to talk freely and

openly. But they wished to become fast friends. Chandrasena eagerly looked for Mohanakumara's visit, and when at last he came, welcomed him very warmly.

"I spoke to my father about our meeting. He related to me a few stories of our ancestors, from which I knew we are related."

"I too learnt the same from the minister."

"Before many years will be past, father said he would crown me Emperor. We shall be two friendly rulers."

"Yes. But apart from this family relationship and friendship, you and I shall become bosom friends."

"And as long as I remain a prince, I shall be ever and anon coming to see you."

"Then you will make me very happy indeed."

The next time they met, they became more familiar. They related their histories each to the other, the story of Mohanakumara's life was no less romantic and interesting than Chandrasena's. Chandrasena spent much of his time in his friend's company whenever he came to visit him. In course of time their friendship became so great, that the prince would stay with his friend for weeks together. A year passed in this way. The Emperor was fourteen years old, and the Prince fifteen. One day they had the following conversation.

"Dear friend, I feel very happy as long as you stay with me. When you go away, I feel lonely and dull."

"Why, there are your minister, his sons and many—"

"They are either too old or too submissive to be my friends. Only those will do, who are nearly my equals in age and state."

"Suppose I always remain with you."

"It will be very good. But that cannot be."

"Then how do you mean to remedy your loneliness and dullness?"

"I shall marry."

"Yes, you will marry and have plenty of children and always play with them as with deer. You will refuse to see me as now, or to stay with me long."

"Well, you may joke and laugh. But do you think I shall marry a grown-up man? My idea is to marry a girl of ten or eleven, so that I may have her near, to play and talk with, when you are not with me."

"But where is the king who will consent to send your child-wife to live with you?"

"We must make enquiries."

"It is better to go to many places, and select the girl ourselves. Shall we make a tour?"

"You and I together? If both happen to like the same girl, we shall perhaps have to quarrel, and our friendship may break."

"O, then we shall go separately. Besides, we are related as brothers-in-law, so your wife will be my sister."

"Oh that you had a sister! Our family connection would have been renewed."

"If not in this way it may be renewed in another way. You will bring forth just as many daughters as I shall have sons, and sons as I shall have daughters. To make the marriage ties the stronger let us have hundreds of children like Dritarashtra and so hundreds of marriages."

"But only a sister of yours would be able to amuse me as you do now. Shall we start to-morrow?"

"Did you talk to the minister?"

"No, nor shall I. This is not an affair of the Government, but one of my own. Besides, my marriage will be so much a child's play and so little a state ceremony, that, even if my father be living, I should not like to consult him."

"So you mean to start alone?"

"Not quite alone. The minister's second son will accompany me."

The next morning they mounted two horses and were ready to start. The minister's son was to follow later on.

"Mohanakumara, your capital is a very big city, which I shall see very soon. Tell me if there is any princess there whom I may marry."

"Can you tell of any in your capital whom I may marry?"

"I cannot joke as well as you can do, I must try. In my capital there are no princesses for you. Outside my capital, my information is little."

"Even within our capital, my information is little. You are an Emperor and must know; I am only a prince."

Here the attendant, who brought the horses, spoke.

"My Lord! In Indraprastha there is a king who has a daughter eleven years old. She is not yet married. It is a wonderful story. In a large hall in her palace there is a big bell four feet high and at the base nearly three feet in circumference, and near it a strongly made arrow. The bull and the arrow are of the same metal, but what that metal is no one knows. The vow of the princess, according to her father's proclamation, is that she will marry that prince

who will be able to move and overturn the bell, either by pushing with the hands, or by shooting with the arrow, or by both means. Many princes are trying, but in vain. They come in hope and go away disappointed and surprised, for the bell being hollow should not be heavy and yet they cannot move it even a hair-breadth. The princess does not tell anybody where she found those wonderful things or who gave them to her."

Chandrasena fell into a reverie while listening to the story. It was like a fairy tale rather than a true story. But suddenly he recollected something, and looked up.

"Is all that you say true?"

"Yes, my lord."

"And who was her father—did you say?"

"I said nothing. I do not know that, sir."

"Her name?"

"Kamalavati."

"Perhaps my friend knows."

But when he looked round, his friend was not there.

"Where is the prince?"

"He glided away shyly a few minutes ago."

"I see. Then you must know who that king is. Mind you do not hide the truth."

"I beg your pardon, sir. The prince bade me not to tell you. The princess is his own sister."

Chandrasena sent for the minister's son and accompanied by him galloped towards Indraprastha.

"Mohanakumara did not tell me he had a sister," he said to himself on the way, "perhaps he thought I would trouble him to arrange the match. But would I have given up this adventure? It was very fortunate that I met him in the forest on that day. We shall very soon become close relatives, but what to me looks greater is the fact that we have become and shall remain trustworthy and loving friends."

Chandrasena will be equally fortunate in obtaining a trustworthy and loving wife. Indeed his fortune is such as few people have, for true wives are not so difficult to find as true friends.

VI. MARRIAGE.

Chandrasena did not go straight up to Mohanakumara because he wanted to play that prince a trick as that prince did him the other day. So he dismounted before Kamalavati's palace and was at once conducted into the hall. He tried to push the bell with his hands, but could not. Then

for the mischievous friend of his again appeared thus in his sister's disguise. He sent word to the emperor that the princess was too old for him, and therefore he would take leave.

"You have played the trick too long," said Kamalavati to her brother, "I hear he is going away."

"No fear my dear sister. I shall go and bring him back in a minute. Let me play the trick for some time more and have some more fun."

He galloped a horse and soon overtook Chandrasena who was going away.

"What my dear cousin, you are going away."

"Your sister is too old for me. I was misinformed about her age."

"But she is weeping for you. She says she will marry no one else. By fulfilling her vow, you have become her husband according to the conditions of the proclamation. So you must be married to-day. And what is it you say about her age? If what you say is true, both of you will be of the same age and it is no harm. Besides, consider what a disgrace it would be to our family to have a daughter refused by the husband chosen by Swayamvara. I believe you will follow me to the city."

Chandrasena went back to Kamalavati's palace.

There he was told he must have only a one-day marriage, and that done in secret. He said it was strange. But the prince on the one side and the maids on the other assured him that such was the vow of the princess. After that he had to yield. The maids were to be the officiating priests; this too they told him was a part of the vow. They said the nuptials too must be performed that night, and somehow left him with his wife in a decorated room. He became confused and even thought he must have been dreaming. Finally he took courage, asked the princess to be seated, and began to talk.

"Kamalavati, your brother brought me back, saying that you were weeping for me. Why?"

"Because you were going away. According to my vow you became my husband."

"Do you not feel shy to call me husband? I should hesitate to tell anyone you are my wife."

"Still I shall be your wife."

"You are a grown-up girl and I am only a young boy. You should have vowed not to marry a boy such as I."

"You should not have overruled the bell. Both of us did wrong, if there is any wrong at all."

"But I was told you were only eleven. After my mother was dead I remained lonely for two

years, so I thought, if I married a little girl, I might play and talk with her. With that purpose only I came here. Your brother ought to have told me about your age."

"Did they hide my age? Not at all. Why could you not yourself find it out?"

"How could I? If mother had been living, she would have seen you at first, and I would have been spared a trouble like this."

Chandrasena's face became sorrowful, so Mohanakumara thought he had rather throw away the disguise.

"Well, let not this marriage be a trouble to you. Regard this as a marriage of dolls. I shall marry another or remain single. For you I shall procure a girl of eleven as you want."

"You say this now. Afterwards you will say that I deserted you and will bring me a bad name."

"Believe me, I shall not do so. Now I leave you."

As she rose to go, he also rose and caught hold of her hand. He did so because he seemed to have recognised the voice of the princess, and also because from her words he suspected some one might have been playing tricks with him. Now he felt the hand hard and strong like that of a male. He looked searchingly; yes, it was Mohanakumara.

"Do not go away. I will try and learn to manage with you. After some years you will be my dear wife with a beautiful moustache, my dear Mohanakumari." So saying he pulled out the disguise of his friend, who fled away in utter confusion. The Emperor and others heard of the trick and made merry over it.

Chandrasena was then married to the real Kamalavati. Some day after the marriage he saw her strolling in the flower garden, and when the waiting maids were away, went near to her.

"Kamalavati, come give me your hand and let us walk together. I want to talk with you."

She stepped aside as he tried to hold her hand.

"Why, our marriage is over and yet you fly from me."

He ran unto her and clasped her hand.

"Will you come with me to Vallabhapura?"

"Will they send me so soon?"

"Go and ask your mother. Say I told you. I have neither father nor mother and must be lonely except when your brother stays with me. If you come, we can talk and play with each other."

Her parents consented and she went to live with her young husband.

in which water cure was one of the treatments. There were civil hospitals for the poor, and big hospitals charging for the treatments, for the rich; separate for males and females. He opened girls' schools for the first time in the country. Pure mountain water, which, alas, our doctors advise us not to drink, was always supplied to people's houses by a system of pipes as taught by the Mahamuni. The streets of cities were lighted by gas according to a method learnt from the Mahamuni; especially of Vallabhapura which was a city larger than London, a city of indescribable beauty, a city of unsurpassable sanitation. He knew how to construct a type-writer, a steam engine, an aeroplane but he did not try to bring them into use. But we may excuse him for not doing such a great work, for he did a greater work namely the work of famine relief which none of his predecessors had done before; he would open the state granaries and freely distribute rice to all the helpless poor.

His death took place in this manner. He had fever for a few days which grew very violent, then he had a severe chest pain. He could not endure so much suffering. Having learnt from the Mahamuni how to give up life at will, he now died so painlessly. Kamalavati also learnt that and though she had no sickness, she too followed her husband soon.

Chandrasena left behind him a son, a daughter, a number of grand children, and more than all the brotherly Emperor, relation and friend Mohanakumara, to mourn his loss. Of these and of the people of the two empires few could speak of him or relate his story to each other without shedding tears. And can we even at this distance of time, read his life without being deeply moved, without being thrilled with emotions, without shedding a few tears? His life is a life of sorrows and joys, a life full of incidents and adventures, a life extraordinary, a life ennobling, a life long enough, yet singularly free from every taint of vice.

PESSIMISM.

BY

DR. A. WORSLEY.

TO the philosopher Pessimism and Optimism are alike impossible, for no such thoughts can exist in pure philosophy. Yet to the desirous person generally, to the moralist, the devotee, the propagandist, these conceptions may represent a very practical emotion. For Desire presupposes some possible betterment, some further involution, some conceptually attainable objective. Hence it seems that every Nescientist, just because he is desirous and can hence never be satisfied, must be a "practical pessimist." We find many exemplifications of this fact. If we take Schopenhauer as the greatest exponent of a more or less undiluted pessimism, it can be shown that this very acute thinker has often failed to realise when he crossed the boundary between the concepts of pure philosophy and the precepts of our experience bounded by Objectivity. His faith in his misery of mind was brought about by the fact that he had unknowingly left the goal of pure philosophic thought. At such times the phantasmagoria of multiplicity obscured his mind. He was desirous of something, and it was in truth the illusive nature of the benefits which he imagined might be obtained in a world constituted otherwise, and the very impossibility of satisfying his desires in the world as it is, that formed the basis of his pessimism. He never realised that the world-as-it-is is the only possible world for us as we are; is sustained by our own thought; is bounded in every case by an exact equipoise between the Pairs of Opposites, in which Good and Bad, Pain and Pleasure and all else, balance each other with the utmost exactness in every instance. Therefore the wish for a world reconstituted to suit himself was not only a wish for something impossible, but for something which, if possible, must likewise have been inequitable for some of us. Hence my contention that Pessimism is founded upon some still-existent desire for a preferential position above the equipoise of each pair of opposites, for some

* As his wish was founded on Nescience, so the world of his wish would be irrational, and hence impossible if we continue to postulate rationality. Compare "Concepts of Monism."

position in which joy and well being would no longer be matched by misery and ill being, is a desire for something at once impossible, unthinkable, * and irrational.

It has been said that Schopenhauer would have had many disciples had it not been that his system is shadowed throughout by an almost inexpressible misery, and that this extreme position has prevented his philosophic doctrines from being accepted by many. I hardly hold with this, because I think that the whole of his philosophy is dominated by the introduction of a pseudo ethical element springing from his own thought. Wherever, through the introduction of this element, he was brought by process of thought into an impossible position, he sought solace in extreme pessimism. Hence, through failing to free his philosophy from a certain element of morality, he was constantly expressing his inability to free the world from that which, in his view, was wrong and bad, and he failed to realise that an eternity of "bad" thing* must result from the introduction into pure philosophy of any ethical contention whatever. Time, Death, and Deeds, cannot cross the bridge separating the temporal world of ethical dispute from the eternal world of abolutism. The attempt to drag them across is a flaw in thought, is an attempt to bind Philosophy by the shackles of Karma, and is hence inadmissible.

Optimism and Pessimism are antagonistic tendencies, or emotional extremes, between which our thought remains balanced. It is therefore a fact, however surprising it may appear at first sight to some, that whatever admits a sense of optimism is the same thing which admits a sense of pessimism, because our thesis is only knowable through our antithesis, these latter being but two phases of one thought. Now when we consider the theology of the Hebrews, how the good and perfect Jehovah had made the good and perfect world, in which no one could suffer but the bad man, we recognise at once that the whole of this optimistic thought originates in the admixture of Ethic and Philosophy. This theology of ethical opinion, with all its manifold changes and possibilities, does not depend upon the metaphysical reality of an eternal and changeless Being, but upon a second world likewise of change and of opinion, viz, the Heavens of Jehovah. There over again was enacted the drama of human life, good and bad deeds, mistakes, aversions,

anger, revenge, pleasures, joys, and the whole phantasmagoria of existence. Hence we can clearly see why it was necessary to conceive not of our world and that other world, but of our world and several other worlds which rose one after another like the storeys of a Chinese temple, none of which were quite spiritual and none of which were quite material. It is perhaps in Persian thought that we find this necessity of multiple heavens most clearly dwelt upon, and we must remember that Persian thought resembled that of the Hebrews in very many respects, and even went beyond it in this particular—that it demangled at least nine heavens to bridge the gulf between the physical and the metaphysical,—and then at last left it unbridged.

So we know for certain that Pessimism is built on the same foundation of thought*, and also exists as a confused *tertium quid* between the world of physics and of metaphysics, and is but another instance of philosophic thought obscured by ethical contention. Only it is true that in the case of the pessimists they have imagined that this world of ours is something very close to Hell, for in it Evil predominates, sorrow and suffering resulting therefrom. To them the only possible escape from this hell is in a state of non-being, as conceived by Schopenhauer.

In the system of Gautama † we find ourselves still struggling with opinions. From Good and Bad we go to Joy and Sorrow, and from Joy and Sorrow back again to Good and Bad, and so on *ad infinitum*, without any possibility of escape except through non-existence. The bullwornness of all this has been seen through by some thinkers both ancient and modern. Among the latter the phraseology may differ somewhat, as when a recent philosopher ‡, told us that it was just as inaccurate to sum up life in smiles and laughter, (sorrow and tears) as in goodness and abstract virtues (badness and vices). But to this acute saying it should be added that it is no true description or definition of life, but is a mere enumeration of opinions, mistakes, and errors, and is dominated by the belief in an alleged freedom of the Will which has no demonstrable basis in fact. In other words both Optimism and Pessimism take no account of the eternal aspects of life, but are entirely wrapped up in, and are based upon, the

* As is this Jewish theology.

† The Buddha.

‡ Nietzsche. The antithesis (in brackets) are my own supplements.

* In so far as we cannot think it out, but only think of it.

transitory phases of existence. These latter they seek to convey from the earth to the heavens, like the prisoner who continued to carry his chains after his release from bondage, not realizing that all limitation is in some sense time-bound.

Now there is only one bridge between the two worlds, and this is found by the Pathway of Illusion * which leads us to realize that all the forms of our apprehension (Time, Space, and Casualty) are something relative to ourselves, and are hence illusions, and are incommensurate with absolute Being. On the other hand it is not possible to conceive any system of Optimism or of Pessimism except as depending on the confused basis of thought in which Ethic and Philosophy remain intertwined.

There are three spheres of philosophic concept in regard to the Self. In the lowest sphere Philosophy has not shaken itself clear of Ethic, and still conceives of the Self as attached by deeds † The middle sphere is that in which Optimism or Pessimism rage, in which philosophic concept has not shaken itself clear of the alleged result of deeds, that is of Sorrow and Joy. The highest sphere is reached by him "who moves about indifferent to Sorrow and Joy, not attached by all this." This is the highest concept of the Self.

Now in the lower spheres Philosophy and Ethic are hopelessly intertangled, and it is these spheres which are filled by religious thought; for we find numerous instances ‡ in which such ethical basis is made the working hypothesis of a religious system to which a transcendent factor is added from metaphysical thought. When we specially consider the middle sphere occupied by the optimist and pessimist, we find that here also Nescience still obscures the true Self, and that every class of impossible thought has had its advocates from the long drawn out misery of Schopenhauer's pessimism, down to the equally impossible theodicy of the Hebrews. Uncertain traces of both Optimism and Pessimism appear in the Hindu systems, for we find on the one hand that all the orthodox systems of Brahmanic philosophy are based upon Pessimism, inasmuch as the sorrows and sufferings of the world furnish the first motive to embrace Philosophy. The neophyte is always regarded as feeling sick, that is, as unable to comprehend the equity of the sorrow

and suffering which (in his view) afflict the world, and as seeking advice from the physician (the teacher of philosophy) who proves to him that this misery is due to illusion, and that the true Self is not attached by Sorrow or Joy. But all this presupposes that the *prima facie* case or first view of the world is one full of sorrow and misery, and that it is only in Philosophy that the negation of, or cure for, this is to be found. Hence the Brahmanic exponents admit the apparent predominance of sorrow and suffering while denying its absolute reality. When we turn to the *Chandogya Upanishad* we find Prajapati going to the opposite extreme of Optimism, for in his words the highest *purusha* "moves about there laughing, playing, and rejoicing, and never minding that body into which he was born." Yet the position assigned to Prajapati is not one of mere indifference to all this, but rather, having started with a confession of inequity due to the misery of life, and having realised that this was illusive, he forthwith goes into the opposite transports of optimism, for which no very apparent reason is shown. Now for the Hebrew, Optimism was the only possible condition of mind, for Jehovah had created the world, and being himself ethically good and perfect, had made the world also good and perfect, without sin, misery, or pain. Hence it was only the evil man who suffered or thought of pain misery, and affliction.* This was perhaps the chief reason for the lamentations of Job, who not only felt miserable and subject to affliction, but knew that his own actions had in some unascertained way brought him to this condition. But it is quite clear to me that if we conceive the Highest Self as not attached by Sorrow or by Joy, then it can neither move about in an atmosphere of pessimism or of optimism, but must remain indifferent, † because the whole phantasmagoria is due to ignorance or forgetfulness, ‡ and that this ignorance, once banished by self-knowledge, has vanished out of its life for ever.

Schopenhauer shows that Christian pessimism is founded on the metempsychosis of evil (Doctrine of Original Sin) and is hence Hindu in its primary thought, and is imbued throughout with ineradicable pessimism. In this it differ-

* The "Christian Scientists" hold this view.

† Rabi said, in effect, "May I neither grieve nor rejoice at the chastisement sent me by God, but remain indifferent."

‡ Of its own absolute Being.

* *Vivarta vada*.

† Christians, Buddhists, etc.

The late Dewan Bahadur Ragunatha Rao.

BY THE HONBLE DEWAN BAHADUR
M. ADINARAYANA AYAL.

IN the death of the Hon'ble Dewan Bahadur R. Ragunatha Rao, C. S. I. the Indian Community has suffered a great loss. It is not so much for any great piece of constructive work that he has accomplished that we prize him as for the aims that he cherished and the incessant watchfulness with which he pursued them. Indeed to any public worker in India the field for constructive work is very narrow except perhaps in the region of religious and social reform and will continue to be so for a long time to come. So far back in the early part of the last century, he grew up in surroundings in which there was little conception of what we understand by the term public service or public life at the present day in India. It was a time too in which the country had not attained a settled form of administration. It was still the period of tentative attempts on the part of the British Government to reduce things to order. He was born in 1831, seven years previous to the accession of Queen Victoria to the throne. This was a time when the Madras Presidency was distracted and dominated over by a number of unruly Poligars frequently at feud with one another, when the Land Revenue Settlements were in a more or less chaotic condition, when the great convulsive events connected with the Indian Mutiny were still ahead and the subsequent elaboration of advanced constitutional forms of Government were in the womb of the distant future.

One great advantage, however, the late Mr. Ragunatha Rao had. He was born in a great Brahmin family settled in Tanjore, which had already acquired considerable eminence and influence by reason of the conspicuous services rendered by his forefathers to the British Government in those unsettled times. His uncle and his own father successively held high administrative positions both in British service and in the Native States of Travancore and Mysore. This tradition of exalted service was maintained in even a more conspicuous degree by his illustrious cousin the late Sir T. Madhava Rao and by himself. He had also the advantage of a sound English education and he was one of that band of eminent and talented men who gathered their broad out-look on life and drew their inspiration for living a high life from that great educationist, the late Mr. Eyre Burton Powell, C. S. I.

Born in affluent circumstances, and backed by the great influence of his family, he soon rose to a high position in the British service. He was barely 26 years old when he was made a Deputy Collector. The high concerns of state in which his own progenitors had taken an exalted part combined with his own temperament and talents gave him an out-look on life which subordinated all consideration of self to the duties he owed to his country. Throughout his long official career which included also a lustrum of service as Prime Minister or Dewan in the Native States of Indore and Bhopal, his manner of discharging the onerous duties of his high office was characterised by thorough honesty of purpose, out right independence of character, and tender regard for the interests of those committed to his charge.

He retired from official service in 1888, but that did not mean for him retirement from the Public service of his country. From the beginning he lived a very simple life. He was always easily accessible. He loved to mix with and interest himself in the concerns of the common people around him. Even while in official service, this characteristic distinguished him from his own eminent compeers who started life simultaneously with him. While the latter were more prone to official methods, to a more bureaucratic line of action, he himself continuously developed a strong faith in the mass of the people and in getting them to do things for themselves. In a word, he was more democratic in spirit than his distinguished compeers. When it was the fashion to look down on humble workers in the public cause as "penniless patriots," he freely associated with them and in many directions laid himself out to co-operate with them.

He had a strong religious bent of mind, and not being content to take the traditions as they came to him he dived deep into the original authorities, qualifying himself for the task by a critical study of the Sanskrit language in which those authorities found expression. So ardent was he in his belief that one of the first conditions of righteous progress was a sound moral and religious education, that even when he was burdened with the cares of office, he frequently snatched time to gather around him young men of hope and promise and to discourse to them on the great questions of the life here and hereafter.

There was no question which affected the public weal that failed to interest him or engage his serious and active thought. In the main he dealt with them in a broad, liberal and tolerant spirit. Questions of social

reform, the amelioration of administrative stringency, and the political progress of the people, all equally claimed his attention, and since his retirement from service down to the time of his death, scarcely a day passed without his communicating to the public through the press, his own cogitations on the many passing events and questions affecting their welfare. The institution of arbitration courts and of village Panchayats, the improvement of agriculture, the amelioration of the lot of the agricultural classes, the relaxation of the social restrictions on Shastric lines, were constantly the themes of his expositions. He had had exceptional opportunities, during his long life, of watching the beneficial progress of the British rule in India and of the gradual enlargement of the liberties and opportunities of the people. His loyalty to the British rule and throne was, therefore, deep and abiding, and the progress of India without the fostering care of England was to him a wild chimera.

Mr. Raghunatha Rao had begun to think out his thoughts somewhat in advance of his time. In the later years of his life, he either found the pace of the events outstripped him, or he thought that they did not progress exactly as he could wish. Whatever the cause, he gradually drifted to a position of isolation and detachment. His own innate worth, however, was so great that, though in the last few years of his life, he seemed to be ploughing a lonely furrow, he never ceased to occupy a high and venerated place in the hearts of his countrymen. The chief lessons of his life to us are his thorough independence of character, his unbending rectitude, the absolute effacement of self in all that he did, and his inspiring and lifelong devotion to the service of his country. He was always hunting outblemishes and when over to find them, he stripped them of their specious trappings and exposed them in their naked deformity to public attention.

For his eminent services under Government, he was given the distinction of Dewan Bahadur in the year 1876. For many years he was the sole recipient of this honor. Quite recently, in 1909, he was made a C. S. I. in consideration of his long and distinguished public services to his country. This mark of royal favor was as gratifying to his countrymen as it was to himself.

He has now passed away full of years and honors, respectable by all classes of his countrymen as well by Europeans. The people's by him is one not easy to lose.—He died on the 2nd May 1912, in the 61st year of his life. May his soul rest in peace.

Current Events.

BY RAJDURAL.

THE BRITISH MINISTRY.

THE strike of the British coal miners has ended. The workers have resumed their daily avocation. Here and there a few mines are still said to be closed. But speaking generally a truce has been established and the district boards are trying to do their best to award the minimum wage even handedly—that is, a wage which would satisfy both the employer of the mines and the miners. In some quarters there seems to prevail no little pessimism as to the permanency of the truce. It is even hinted that before long a general strike, unique in organization and based on the experience of the recent one, may occur which would revolutionise the whole condition of labour. Whether such a prediction is likely to be realized is exceedingly problematical. Both employers and employees have been not a little chastened by the many episodes that have taken place during the recent strike. Lessons have been learnt which are certain to be taken to heart. Apart from the quarrels of these two classes, the wage earner and the capitalist, the attention of the State has been drawn to the serious dislocation of all industries which primarily depend on coal. The question has been raised whether millions of people should be subjected to a variety of hardships, and even to the deprivation of their daily bread, simply because a particular class of workers and their employers cannot agree on themselves to carry out their respective obligations. Why should a majority, an overwhelming majority of the innocent be made to suffer for the economic quarrels of an infinitesimal minority? This is the question of questions which will require the broadest and the most far-sighted statesmanship to solve in the interests of the nation at large. Equally important and pressing is the question as to the straits to which the state may be reduced in an emergency while a strike of this kind is taking place. Are all the means of distribution, locomotion, transport, &c., to be stopped as is to bring the country to a condition worse than that of a huge sieve? Those who, like the coal miners being out a strike, are indeed the worst enemies of the country besides being enemies to their own interests. So far then, the British people have a double duty to discharge as far as their own rela-

tions with the state are concerned. But apart from the functions of the state, there is the economic problem in reference to fuel. Therefore, your practical scientists and other men of industry have also to rack their brains to substitute for coal some other product which may be useful for industrial purposes without making industries dependent on a microscopic minority of workers. It is indeed an equally difficult and complex problem as the other one which statesmen and administrators have to solve. Let us fervently hope a satisfactory solution might soon be found. Nothing short of an international conference is necessary to consider and adopt the needed remedies.

Meanwhile, the ministry cannot be said to be out of its jungle of difficulties. The jungle of the coal mining affair has been somewhat cleared. But there stand more formidable woods through which it has to make its way before it can halloo and take breath. Thanks to expanding industries and trade, the budget has been a most prosperous one, though, of course, the Opposition, which has seldom been known for its strength or soundness in matters of State Finance, barks and carps at it, without showing a better way of raising and spending taxation. Mr. Churchill, like the new broom of the Navy, is sweeping well the different fleets in different waters all over the globe and trying to meet suggestions from both friendly and unfriendly quarters. That is a correct attitude to adopt for any minister. No Ministry, however talented, is infallible and it ought therefore to accept practical suggestions from any quarter with "an open mind." But apart from all other administrative and service measures, it seems that the two pieces of legislation for Irish and Welsh Home Rule are causing the greatest anxiety to the Ministry. There is so much of extraordinary partisan writing in the party papers—*Liberal* and *Union* alike—that an Indian journalist, with an open mind, finds it most difficult to find out the grain of truth from the tons of chaff which is daily supplied. But this much may be said, on an impartial study of the question, that the opposition to the Irish Home Rule, the third of its kind but vastly differing from the two previous ones introduced by the late Mr. Gladstone, is founded on the weakest of weak arguments. The Unionist party, led by Mr. Bonar Law, found out how weak was he to carry on a successful agitation against the Bill in the House. As a result they asked Achilles to no longer skulk in his tent but come out. And Achilles consented. But what even such a hero of subtleties, dialectics,

and Parliamentary strategy as Mr. Balfour can achieve in the face of the fairly good measure of local autonomy which the Ministry wish to confer on Ireland? *The Manchester Guardian* (3rd May) correctly observes that "Mr. Balfour is the biggest man that is left active of the old fighters against Home Rule in the days when the English people really feared it might do them harm and that it would do Ireland any good. It is not like that now." And yet what is the general impression left by Mr. Balfour's speech on Home Rule? He seemed to have talked of dreams of old rather than the practical realities of the day. As our Manchester contemporary remarks, "It was the speech of the fanciful, ingenious, gently malicious looker on who backs himself to allow them any kind of practical means to a plain end and is inherently certain not to attain it, and that nothing can be said for any plan which he cannot prove to be the last thing that anybody ought to say for anything." The upshot is that "working on paper, imagining men and things and events to fit his own fairy tale as he goes, Mr. Balfour easily proves to himself that everything must go wholly wrong in Ireland under Home Rule." So far Mr. Balfour's speech, though able, was disappointing from the practical point of view. We may imagine what Mr. Bonar Law could have achieved under the circumstance, assuming that Mr. Balfour had not again put himself at the head of the opposition. But the second reading of the Bill has passed and it is safe to surmise that the third reading will be a foregone conclusion. So, too, the Welsh Disestablishment Bill. These two important pieces of legislation will be the only achievement of the session. Let us hope for the better welfare and contentment of the Irish, the Welsh, and the Scott, that their respective Home Rule Bills will bring greater prosperity to themselves and the country and the voice of the croakers and the carpers will be hushed.

A MUCH TOM-TONED "VICTORY."

In the continent Italy has tried to demonstrate to the world that it is something more than a second rate power. The Tripolitan achievement, apart from its political ethics, has brought no glory to the Italian arms. Neither has it shed any lustre on Italian statesmanship and diplomacy. The people seem tired of the ineptitude of the generals and admirals. The unbending Turk has not yet bent. If anything, he is tall and erect and is supremely indifferent to the doings and demonstrations of his Adriatic

land's political destiny may be in the future it is impossible to say. For fifty years they have enjoyed peace since the Schleswig Holstein imbroglio, and the later one of Luxembourg. Let us hope these two flourishing states may continue to live in peace and prosperity undisturbed by the ambition and intrigues of their too powerful neighbours who want to swallow them.

PERSIA.

Persia is where she was last month. The North is still disturbed, and now and again we hear of robberies and murders in the South. But poor Persia has had not a moment of rest and leisure. She is still engaged in evolving order out of chaos in face of the many natural as well as artificial difficulties in her path. That Pindari, in the person of Salardud Dowlah, is said to be pressing on Teheran, in the guise of a patriot! to restore order and prosperity! Evidently, the man is the tool of the muscovite. As the ex Shah can no longer be used as a tool to keep Persia in a state of disturbance, this unscrupulous man has been secretly encouraged to play the game in which his brother was caught napping and sent beyond the borders of Teheran. Of course, he is playing a game of bluff and the poor Mejliss must be in a travail to meet this new enemy and punish him according to his deserts.

CHINA.

China is shaping her own destiny. She is sitting down, albeit that the Northerners are still a thorn in the side of the Republic. But Yuan-shi-Kai seems to know his business. Soon the constituent assembly is to be called and the work of the Government begun in right earnest. Meanwhile the Powers greatly interested in the development of the resources of the country are trying to help him in his financial difficulties. A big loan of 60 millions sterling is to be advanced by instalments of 10 millions, the first of which has been already arranged very satisfactorily. The President of the Republic is fully alive to the fact of the regeneration of China lying through its economic progress. Railways and industries will revolutionise the country and its people. And foreign loans alone can realise that destiny for the Chinaman. Finance must be the backbone of China as of every other country. With sound finance, China can well equip herself for internal and external defence, and for developing her vast and most remunerative resources. There is better hope for China than for Persia. So we wish her well.

THE WORLD OF BOOKS.

[Short Notices only appear in this Section.]

The Oxford Indian Reader. By W. Bell Esq., C. I. E. (Clarendon Press, Oxford.)

This handsome little volume of some 320 pages published by permission of His Majesty's Secretary of State for India in Council consists of extracts judiciously selected from the four volumes of *The Indian Empire* which form the introduction to the new edition of "The Imperial Gazetteer of India." It is not, however, a mere summary or abridgment of the Gazetteer; compression has been effected by the selection of significant and representative passages. The aim of the selections here made is to supply the reading world with a manual which may serve to supplement the more elaborate performances of Hunter and Vincent Smith. The scope of the lessons here offered cannot better be summed up than in the words of the editor Mr Bell who observes in the Preface: "The wealth of solid fact and sound conclusion thus made accessible to the young student should help him to take an intelligent interest in the history of India, to form correct opinions on current questions of importance, and to realize the nature and value of historical inquiry."

Two more features of the book before us enhance its value. It is amply and beautifully illustrated: many of the illustrations are taken from original sources. The notes at the end of the volume will be found useful. Both students and laymen may read the book with great advantage.

Elements of Civics for India. By Mr. T. S. Subramania Aiyar M.A., LL.B., Macmillan & Co., Ltd., London, Bombay and Calcutta. (Price Annas Ten.)

The book consists of a series of lessons in civics written in a clear and simple style so as to be serviceable to young men in high schools. It discourses on the various duties of the State, the rights of the individual and their mutual obligations and responsibilities with special reference to the conditions of India. Treating as it does of Modern India, for the most part history merges in politics, and the subjects are dealt with in a masterly manner. Every school boy must read this handbook of civics which is likely to supersede Sir W. Lee-Warner's celebrated 'Citizen of India.'

Ballads of the Brave *Selected and arranged by Frederick Langbridge, M. A., D. Litt.* (Methuen & Co., Ltd. London)

This is the fourth edition of the book and is appropriately dedicated to Mr. Rudyard Kipling. In the older editions Mr. Langbridge was guided by the principle that a boy's poetical palate should be cultivated on songs about swords and ships rather than about primroses and pet lambs. He has lately changed his views to a certain extent and in this new volume the rain of blood and thunder is toned down. All outworn matter again has been replaced by poems from recent authors thus bringing the story and interest down to the present hour. It is a book for all who are proud of England's victory in land and sea. Every page of the book breathes an atmosphere of chivalry and courage. It is a gallant pastime for high spirited lads.

Spanish Gold by Mr. George A. Birmingham, Methuen & Co.

Spanish Gold is, as the author says, about a treasure buried in an island. The scene is laid in a remote part in the west of Ireland. The Rev. John Meldon, a genial and practical sort of man without anything of the solemnity of his calling is the hero of the story. The information in an old diary sets him hunting after treasure deposited by a Spanish sea captain whose ship was wrecked in the Armada. With intelligent deduction Mr. Meldon comes to the right spot but he is prevented from approaching it by a shrewd old native and a rival party. After much disappointment and hardship the treasure is found hoarded up in the native's cottage and the rival of Mr. Meldon tries to rob the native of the wealth. Mr. Meldon who had been befuddled by the native gets badly wounded in the robbery but his never-failing resources of mind enables him to wrest the gold from him. This is scattered among the poor natives of the island.

The Chief Secretary for Ireland happens to be present and he conceives a great admiration for Mr. Meldon whom he appoints to a comfortable living which enables him to marry his beloved girl. Mr. Meldon is an excellent creation: he is remarkably humorous and he is the right man to win his way through all classes. He has unbounded sympathy and possesses a high sense of honour. The other characters possess sufficient individuality. The novel is a vivid narration full of humour.

Thoughts from Kalidasa. *Edited by Sumanas H. Dhruva, D. B. Taraporevala Sons & Co., Bombay, and G. A. Natesan & Co. Re One*

This is the first volume of the *Dainty Thoughts Series*. Each volume is devoted to the study of a single author. When we recollect the marvellous beauty and grandeur of Sanskrit poetry, we are surprised at the scarcity of such 'gems' and 'treasures' from the master minds of song. There have been collections indeed from Sanskrit literature but they have invariably been of an encyclopedic character and are useful only as books of reference. In this book each verse in itself contains one complete thought and the selections are so made as to satisfy every variety of taste. Along with the original, metric translations by the three well known oriental scholars Sir William Jones, Dr. H. H. Wilson and Professor Monier Williams are also given.

A Guide to Modern Machinery. *Published by the General Secretary, the Indian Industrial Conference, Amraoti. Available at G. A. Natesan & Co. (Price Annas Twelve).*

Mr. Mudholkar as General Secretary of the Indian Industrial Conference, has received various inquiries in regard to machinery required for carrying on the different industries existing in India and the names and addresses of manufacturers and importers of the same. He has been doing his best till now to furnish such information from the sources available to him. With a view to meet this daily increasing demand the present compilation has been prepared by his office under his directions. It is a necessary directory for businessmen.

A Pocket Lexicon and Concordance to the Temple Shakespeare. *Prepared by Marian Edwards London, published by T. M. Dent and Co., Aldine House, W. C. (cloth 2/6 net)*

This small volume has been specially designed to be used with the "Temple Shakespeare," and, it is thought, will be found a very useful and handy companion to the reader. It contains a valuable glossarial index and quotations from the chief authorities in interpretation of the more obscure passages, accompanied by as full a concordance as possible. The illustrations have been chosen as a result of most careful search at the British Museum.

Sport on the Nilgiris and in Wynad By
F. W. F. Fletcher. Macmillan & Co., London,
1911. 12/-net.

In this work by a well-known sportsman and planter on the Nilgiris those who are interested in the wild life of the hills of Southern India will find an excellent description of the games practised there together with a very readable account of many shooting adventures and incidents. The book has been got up in a very businesslike manner. There is a large map of the Nilgiri District at the beginning, not perhaps quite so good as Mr Fletcher might have obtained but still serviceable, while at the end is a copy of the Game Act and Rules regulating shooting, a list of Mammals and Game Birds, some hints on preserving skins, and a "Glossary of Native words." Mr. Fletcher possesses the first great qualification for authorship—enthusiasm for his subject. He writes a well-merited eulogium of the delightful climate of the Nilgiri Hills and adds the interesting fact that the prevalence of malarial fever in the Wynad is far less than it was thirty or forty years ago. For the wild beasts too Mr. Fletcher has on the whole a thoroughly appreciative eye. His first favourite is obviously the elephant, and he vigorously contests the late Mr. Sinderson's depreciation of this animal's intelligence. He gives a number of instances of the astonishing "cheek" of the leopard, which will carry off a dog from under the very nose of its owner, sometimes even venturing into the verandah of a bungalow in broad daylight for this purpose. Mr. Fletcher regards the bear as the most dangerous of all animals inhabiting this part of India with the single exception of a rogue elephant. The tiger is by nature an exceedingly shy animal and will almost always avoid man if he can, but the bear is "always a surly morose devil, afflicted with chronic ill-temper, who never misses an opportunity of venting his spleen on anyone who crosses his path."

On many of the moot points in sporting lore Mr. Fletcher has strong opinions. He has plenty of tales of actual adventure in the field and in dealing with these his writing is clear, forcible and interesting. It is only when he gets away from the real subject that he knows and essays a bit of fine writing that he fails, and luckily these attempts are not very numerous. On the whole the book is to be welcomed as a very workman-like account of sport and game in the hills of Southern India.

Diary of the Month, April—May, 1912.

April 25. Sir William Plowden to day read a paper before the East India Association on "The Problems of Indian Administration." He advocated giving Indians greater chances in the Army and the Police.

April 26 The Annual Meeting of the Madras Mahajana Sabha was held this evening at the Lyric Theatre. The Hon'ble Nawab Syed Mahomed presided.

April 27 A Meeting of the Indian journalists of Lahore was held this afternoon at the *Paisa Akbar* office to express regret at the tragic death of Mr. William Stead.

April 28 Both the American and the English enquiry into the *Titanic* disaster are proceeding. Several new facts have come to light in examining the evidences.

April 29 At the Vakils, Association, High Court, to-day, the Hon'ble Sir Arnold White, Chief Justice, unveiled a portrait of the late Hon'ble Mr. V. Krishnaswamy Iyer, C. S. I.

April 30 The following Press *communiqué* has been issued by the Education Department:—A Conference will be held at Simla in July next, under the Presidency of the Hon'ble Sir Harcourt Butler to consider questions concerning the education of the Domiciled Community.

May 1 In the House of Commons, Sir John Rees asked whether, in view of the neglect of measures for the suppression of the use of opium in China, the arrangement between India and China would be continued unchanged.

Mr. Montagu replied that the Agreement was still in force and the Government were confident that, with the restoration of order, the Chinese Government would speedily secure compliance in the Provinces with the stipulations of the agreement.

May 2 In honour of the Hon'ble Mr. G. K. Gokhale, C. I. E., a dinner was given in the Ripon Club, Bombay.

May 3. A Press *communiqué* states:—The Hon'ble Sir Guy Fleetwood Wilson, C. I. E., K. C. B., K. C. M. G., has been granted six months leave from the 19th instant. Mr. R. W. Gillan, C. S. I., will officiate in his place.

May 4. Sir Thomas Raleigh has spontaneously offered a suitable portion of his collection of law books with cases, which, with the surplus of law books from the India Office and law reports and legal publications from the Government of India,

TOPICS FROM PERIODICALS.

The Modern Messiah.

In the *Open Court* for March, Mr. Har Dayal writes a remarkable article entitled "What the World is Waiting for."

Mr. Har Dayal was educated at the University of Punjab at Lahore. He then spent a couple of years at Oxford. On his return to India in 1908, he decided to become a friar and lead the higher life. But he found the conditions of India unfavourable for such a pursuit and returned to Europe. After spending some time in London, he started on a journey to Paris, Switzerland, Italy, Algeria, and the West-Indies and finally reached the United States of America in February, 1911. From there he has published the result of his studies and observations in the paper which he calls "What the World is Waiting for."

The time-spirit, Mr. Har Dayal says, is in travail, but the ideal, which shall be a Messiah unto humanity, has not yet been ushered into light. There has been a great intellectual advance which has deprived the educated classes of any definite philosophy of life, and there is everywhere visible a moral set back. The young generation question the very possibility of the higher life of renunciation and self-control. Passion is to them a deity:—

Even Bernard Shaw, who is very sane in some respects, sneers at St. Francis for his love of poverty, and at St. Anthony for his love of the animal creation. A false gospel of individualism, enjoyment, and philistinism is perverting the minds of our young men and women. It is bad indeed when practice falls short of the ideal. But it is infinitely worse when theory itself betrays its trust, and panders to our lower nature. Idealism, with its great message of poverty and suffering, has fallen among the thieves and robbers of "evolution," "socialism," and the rest.

All symptoms point to a general exhaustion of the vital force of the race—namely its moral energy. What then is to be done? If the fear of poverty is the curse and nightmare of the

world, the worship of poverty is the only way to salvation. Renunciation and renunciation alone will save humanity. The writer continues some what in the vein of Ruskin:—

Poverty, the lovely bride of St. Francis, the saviour of nations, the guardian of liberty and science, must be enthroned on the pedestal from which the Reformation, the crude philosophy of the eighteenth century, the modern theory of "success in life," and the pseudo-ethics of the evolutionists have dragged her down. The worship of rage, dirt, penance, homelessness, and obscurity in the individual must be re-established if humanity is to get rid of poverty, disease, dirt, inequality and ignorance. Asceticism must be brought to the aid of science and politics, in order that this mighty edifice of civilisation may be prevented from tottering to its fall in the twentieth century. Let us bring back the age of St. Francis and St. Bernard, adding to their purely spiritual zeal our knowledge of science, our experience of politics, our wisdom in dealing with social evils, our wider outlook upon life, and our keener appreciation of the solidarity of humanity beyond the bounds of creed. This is the work of the new Franciscans, whom I already see with my mind's eye beautifying and glorifying and vivifying this our civilisation with their moral fervour and their intellectual gifts.

If that is done the world will be converted into a paradise. He would therefore proclaim the union of rationalism in religion with practical renunciation in ethics. With this end in view the whole country should be covered with monasteries devoted to scientific research and sociological studies. Mr. Har Dayal says:—

Yes, the new orders of monks and nuns, correcting whatever was fantastic, unnatural, foolish and superstitious in the medieval ideals, will usher in the golden age of the future. Thus will the ideals of St. Francis, St. Rose, Rousseau, Voltaire, Marx, Bakunin, Mazzini, and *Isaack* be united in one beautiful whole. And that is to be the Ideal-Messiah of the twentieth century. Our Messiah will be an ideal and not a person, for our ideal is so vast and grand that no one person can realise it in its entirety. Therefore we put the Ideal first, and then we shall have devoted servants of the Ideal as our prophets and seers.

From India, the land of living spirituality, comes this great message to the Western world. From the Middle Ages, the period of spiritual awakening in Europe, comes this voice borne on the wings of time. Thus the past and the present combine to make the future. To all my American sisters and brothers who are perplexed and doubt-tossed I say: "Touch science, politics and rationalism with the breath of life that renunciation alone can give, and the future is yours."

This is what the world is waiting for—a new impersonal Messiah!

The High Prices Problem

In *East and West* for May Mr. A. Morgan Young writes an elaborate article on the problem of "High Prices." Within the last ten years the prices have increased abnormally. Whether it be in European markets or American, the increase of prices is very remarkable. The production of gold in recent years is by no means discouraging and there is no reason to suppose that the population of the world has suddenly risen to gigantic proportions and yet the prices are high. Nor can it be said that people have become lazier than before.

But throughout the greater part of the civilized world, where the earth does not actually "in one year produce food to last for thirty," it might easily be made to do so, some other explanation is needed of why for a great part of humanity hunger is ever in the foreground and destitution almost completes the circle of the horizon.

The difficulty lies at the root of our commercial system, and consists mainly in the curtailment of supply for the sake of getting the maximum price. This phenomenon has been touched upon by Fabian Society writers, especially Mr. G. B. Shaw, who puts the whole case very clearly thus —

"The main point to be grasped is, that however useful any commodity may be, its exchange value can be run down to nothing by increasing the supply till there is more of it than is wanted. The excess, being useless and valueless, is to be had for nothing, and nobody will pay anything for a commodity so long as plenty of it is to be had for nothing."

The reason why amidst such an abundance there is a lamentable poverty side by side is the monopolising of the trades by wealthy capitalists.

As has often been pointed out, the world offers small rewards to those who help it to live. The inventor, the scientist, the artist, the poet and the prophet, often fail to make a living at all, while the riches of the monopolist are boundless. The idea of the organisation of production has been most fruitful in America, and it is in America that the evils of the curtailment of supply have been first recognised and most vigorously opposed. Presidents Roosevelt and Taft declared war against the Trusts and have tried to break up their monopolies. The Standard Oil Company is the most familiar instance of the American "Trust," and the one most perfect in its working. Mr. John D. Rockefeller, who is recently reported to have resigned the Chairmanship of this concern, rather confused the issues by having a conscience. With regard to his rivals in the oil trade, he used all the arts of "freezing out" and "side-tracking" implacably. On the other hand, he was always ready to buy out a

competitor at a fair price and employ him in the business. He brought the distribution of his products to such perfection that Standard Oil trickled into the remotest villages of Central Asia and all the hinterlands of Africa. Consequently, he is wealthier than ever was *Tear or Moghul*, and because Standard Oil is an excellent article at a moderate price he is apt to look into his heart and discover that he is a great benefactor. The limits of the price of oil, however, are dictated by the competition which he has failed to control rather than by what he has absorbed. If his tentacles were long enough to embrace coal and firewood, the price would rise till it absorbed all the profits of artificial lighting and power. Mr. Rockefeller would probably resent as a gross travesty of the facts, the assertion that he curtails production; he supplies more and more every year; nevertheless the whole object of his operations is to withhold oil from those who will not buy from him at his own price.

But what is the solution that is offered to clear the difficulties of the situation? It seems as though the great economists of repute were false prophets. And the good men who have been mocked at for their so-called sentimentality are likely to turn profitable teachers of the 'dismal science.' Ruskin and Carlyle were mere religious enthusiasts. And the Political Economy of the former was not a little reviled at in his day. The writer of the article pleads for a modified form of socialism and ends very much like the much abused enthusiasts of a former age. His remarks are perfectly true.

A necessity of socialism is that it believes legislation will succeed where religion has failed. A general practice of Christian charity, or of Mahomedan or Hindu charity for that matter, might solve the economic difficulty, but it never has on any large scale, and socialism as a rule are even more full of hatred of the old remedy than of enthusiasm for the new. To a good many it will seem ridiculous that a paper which began with a discussion on high prices should wander on to a suggestion of Christian charity as a possible remedy. An attempt has been made, however, to show that the organisation of industry and protective legislation have not really improved the economic position. They have given many a precarious foothold who must else have gone under in the struggle, but they have brought many more nearer to that insufficient supply with which it is most profitable to fulfil their demands. This is the real burden of high prices. The relative value of gold adjusts itself painfully, but the economic necessity of supplying a little less than people want does not adjust itself.

The Ethics of Manu.

In the *Hindustan Review* for April there is an instructive article on the "Ethics of Manu" by Mr. G. A. Chandavarkar. Differences in ethical speculations are very common. Even in these days of profound specialisation philosophers have not all agreed on the subject of morals. One class of people declares that implicit faith in the Omnipotence of God has been the sole cause of the development of the sense of morality in man. On the other hand there are the ethicists who maintain that safety of morality does not depend on belief in any religious or philosophic cult but in a real and living faith in that fixed order of nature which sends social disorganization in the track of immorality as surely as it sends physical decay after physical trespasses. To them 'the death of dogma is the birth of morals.' The Science of Ethics gives us the ideal of human life and metaphysics justifies the conviction that moral life is worth living for and dying for in our attempt to realize that ideal.

Manu the great 'philosopher-statesman' seems to have followed a middle course. He combined the teachings of the Ethicists and the religionists. Sometimes it is difficult to reconcile his theories with the postulates of modern thought. He classifies the cardinal virtues of man as follows:— (1) Courage and firmness of mind. (2) Forgiveness. (3) Devotion to Virtue. (4) Honesty. (5) Purity (bodily and mental). (6) Direction of senses in the path of Rectitude. (7) Development of intellect. (8) Acquisition of true knowledge. (9) Truthfulness. (10) Freedom from anger.

The writer then illustrates each one of these virtues in turn and demonstrates the logical sequence of their order i. e. how every succeeding virtue is a necessary completion of the one that precedes it.

The writer contends that Manu is essentially a nationalist.

Mr. P. Vivian, the writer of the book "*Church and Modern Thought*" (R. P. A. Series), includes Manu as a typical ethicist and rationalist among many other writers as Huxley, Edward Clodd and F. J. Gould, and quotes the following Shloka as translated by Max Müller, "Where is the seat of authority for what is moral? Manu, the Indian Lawgiver, answers it in four ways: It rests on revelation (Shruti); it rests on tradition (Smṛiti), it rests on the behaviour of good people and lastly it rests on inward satisfaction."

The following classification of the system of ethics as enunciated by Manu may be interesting to us when examined in comparison with the principles advocated by philosophers of equal repute. They are almost identical.

Confucius' classification.	Manu's classification with Sanskrit equivalents.
I Righteousness ..	I "Satyam."
II. Knowledge ...	II. "Vidya."
III Magnanimity ...	III. "Kshama."
IV Energy ...	IV. "Dhṛiti" or Courage.
V Gravity ...	V. "Dhee."
VI. Earnestness ..	VI. "Dama."
VII Kindness ..	VII. "Akrodha."

Plato's cardinal virtues. Manu's equivalents in Sanskrit.

1. Courage ..	(1) "Dhṛiti."
2. Wisdom ...	(2) "Dhee."
3. Justice ...	(3) "Satyam."
4 Righteousness ...	(4) "Asteya."

Bhishma's enumeration in the Mahabharata. Manu's Sanskrit equivalents.

(1) Control of anger ...	"Akrodha."
(2) Justice ...	"Satvam."
(3) Forgiveness ...	"Kshama."
(4) Chastity ...	"Shucham."
(5) Purity of conduct ...	"Do."
(6) Maintenance of dependants.	
(7) Simplicity ...	"Indriyanigraha."
(8) Truthfulness of speech ...	"Ataya."
(9) Avoidance of quarrel ...	"Dama."

Marcus Aurelius' Enumeration. Manu's Sanskrit equivalents.

(1) Endurance of labour ..	"Dhṛiti."
(2) Sincerity ...	"Satyam."
(3) Contentment ...	"Asteya."
(4) Benevolence ...	"Kshama."
(5) Magnanimity ...	"Satyam"
(6) Frankness ...	"Satyam"
(7) Aversion to pleasure ..	"Indriya Nigraha."

THE LAWS OF MANU IN THE LIGHT OF THEOSOPHY, by Bhagavan Das M.A Price Rs. 1-8.

G. A. Natesan & Co, Sunkurama Chetty Street, Madras.

Mrs. Annie Besant

H. W. N. writes an interesting sketch of Mrs Annie Besant in the *Nation*. Some five and twenty years ago he had seen her in England when she was a pronounced atheist. He had seen her in the days 'when the Hall of Science was a pulpit alike for the apostolic Liberalism of Charles Bradlaugh and the dogmatic socialistic heresies of John Burns. Both indeed were great orators.

But one morning, though Bradlaugh was in the chair, neither he nor John Burns was speaking, and instead we were addressed by Mrs Besant, a young and beautiful woman, uttering her sentences in clear succession one after another without a grammatical fault or the slip of a word, so that the precision became rather monotonous after half an hour. Her subject was 'The Ethics of Punishment,' and she treated crime as a form of disease, in what was then regarded as the scientific manner. Only one sentence has remained with me, but it has sometimes returned to my mind amid the scenes of ordinary life, war, and Government domination. She had been speaking about the treatment of incurable criminals by seclusion, so that at least they might not perpetrate or diffuse their disease of character. 'You may think this a sad solution,' she added 'Ah, my friends there are so many things in life that are sad!' We went out with a sense of the speaker's entire sincerity. We had heard a native crying like Carlyle, 'The truth, though it blast me!' One could not but recognise the unflinching sincerity, though to me at least, the truth thus revealed appeared to match the building and the audience only too well. It matched them in depression, and in a kind of dismal but defiant self righteousness.

Only a year or two later came the hour that Mrs. Besant describes, when, alone in a City office at night, she heard a stern voice saying, 'Are you willing to surrender everything in order that you may know the truth?' and she replied, 'Surely, that is all I need.' Is there nothing that you hold back? the voice persisted, 'Will you let all go?' And she answered, 'There is nothing I will not surrender, if I can only know.' And within a fortnight the great change came. Certainly she surrendered all.

After many years of strenuous work she came to India. With such a mind she could not indeed be quiet and calm. She had read much, travelled far, and meditated on many things. Her experiences of life have been as varied as they are intense. She has changed many forms of religion and has passed through each one of the great ancient creeds and now

how different was the scene the second time that I saw her! It was the sunrise of an Indian day. . . . In some bare chamber of her Indian college—a vast School of Truth, where seven hundred Indian youths are trained up in the purified religion of their prehistoric fathers—robed as a Hindu in white

and seated cross legged on a raised platform in the centre, Mrs. Besant herself received me. To my wise Guru or spiritual guide, who entered later, she rose and did obeisance, but recognising in me one of her own common countrymen, entangled, as our countrymen usually are, in the nest of unreality, politics, arts, possessions, passions, and vain desires, she spoke to me of little beyond the fire-like interests of this transitory life—the British Government, the chances of Indian reform, the violence of revolution, the course of human knowledge, and similar matters of small significance. She then dismissed me with my Guru, who gave me instruction upon eternity for the rest of the morning.

Her position to-day is that of a great guru and she exercises it with all the eclat of a born leader of men.

And now I have seen her again in London, and every Sunday morning for some weeks past she has gathered vast and silent crowds of listeners at the Queen's Hall. She enters, dressed in white, touched with gold. The mass of hair is white now, and so is the powerful face, deeply carved by life. There is little applause as she enters, or as she goes. Most of the audience just rise, feeling themselves to be, as it were, half in church; and the greater part of the listeners would no more appal her than an Archbishop in St. Paul's. Yet now and then a subdued clapping or murmur of assent is heard always at minor points which are thoroughly understood, and do not appear too sacred for approval. As when speaking of the three crimes that most obstruct the spiritual traveller upon the path, she denounces gossip first, and passing on to cruelty, denounces vivisection, sport, the beating of children, and the neglect to pay wages or burs, and again passing on to superstition, denounces first the animal sacrifices that still obscure Indian religion, and then suddenly turns her parable against the British caravans which devour animal sacrifices themselves. The audience signifies approval, though the great majority is conscious of the fragrant of sheep and oxen at that moment dripping gray in sacrifice to an appetite far less divine than the goddess Kali.

The themes of her discourses are obscure enough. She speaks of meditation, life after death, the seven planes, the grand masters and a thousand other matters of deep spiritual import.

Apart from the substances of her discourses two memories chiefly remain with me, first, the power of an entirely sincere and courageous personality—one who, without any very remarkable endowment of intellect, imagination or philosophic knowledge, has indeed given up everything in the search for truth, and has never desisted from its pursuit, however varied and baffling; and, secondly, I remember that enormous crowd, gathered Sunday after Sunday, some for fashion, some for curiosity, but in the main compelled thither by the ancient longings, which, from the faint consolations of a comfortable livelihood, or a negative and limiting philosophy, craves unsatisfied. 'Oh, that I knew where I might find Him, that I might even come into His presence!'

The Untouchable classes of an Indian City.

Dr. Harold H. Mann contributes the first of a series of papers on the above subject in the March number of the *Hindustan Review*.

The existence of such a class is not of course unique to India, but its origin elsewhere can generally be traced with fair clearness, and its continuance is a matter of comparatively short duration. In the present instance, however, its origin is absolutely unknown and the theories which have been put forward by various observers obstinately refuse to fill all the facts,—while it has remained a feature of Indian society for many generations, so much so that its abolition would mean a social reconstruction of the remaining people of an exceedingly fundamental character.

Mr. Mann's enquiries relate to the city of Poona. The untouchables are of five classes. There are about seven to eight thousand members of these classes in the city. They live segregated from the rest, and are largely unknown to the general public. The more important results of Mr. Mann's enquiry are:

The largest of the five castes with which I intend at present to deal, is that of the Mahars. These, number probably between two thousand and two thousand five hundred, in Poona city; my figures refer to 2,068 persons. They may be divided into two classes. The first of these are the *wafandar* Mahars of Poona, the descendants of those who were formerly attached to the three villages out of which Poona has grown. They have their land and *wadars*; though they are segregated yet the land is theirs, the houses, more or less well built, are their own, and this is reflected on their habits and conditions in other ways. In contrast with these, the natural inhabitants of the place, are the large crowds of people who have been attracted to Poona for work and who live under much more squalid and unsatisfactory conditions.

The household arrangements for the latter are very peculiar. The owner of the land on which they have settled does, as a rule, nothing for them except put a latrine in the field. Beyond this the tenant builds his hut, and it remains his. He pays a ground rent of say eight annas per month for the space, but the hut is passed on from tenant to tenant. Such a hut is generally made of mud, and roofed with corrugated iron or old kerosine oil tins, and it is generally about twelve or thirteen feet by six feet or eight feet over all, and it is *only sometimes built on plinth a few inches high. Inside it is usually divided into two small rooms, by a partition which goes partially across the room, made also of mud, and sometimes there is a space in the roof used for storage or for sleeping. There is often a very small verandah, included in the above measurements, on which sometimes a goat is kept.*

THE DEPRESSED CLASSES.—A Symposium by His Highness the Gaekwar of Baroda, Mrs. Annie Besant, The Hon'ble Mr. Gokhale, and others. Price One Rupee. To Subscribers Rs. 12.

G. A. Natesan & Co., Sunkurama Chetty Street, Madras.

Buddhism in the West.

Jeno Lenard writing in the *Buddhist Review* for the first quarter of 1912, on "Buddhism in Western Thought," reviews the progress of the various religions of the world as they flourish to-day. The teachings of Christianity, he fears, cannot long continue to possess a hold on humanity.

In spite of lavish expenditure and zealous work, Christian missionary effort is practically sterile, even under the most favourable conditions, namely, among uncivilised and uncultured people. We see that the political power, which the churches have won for themselves, lasts only so long as the intellectual force of their leaders can maintain their forlorn fight against the ever-increasing flood of infidelity; and, so soon as the mental and moral grip is lost, Saint, Pope and Priest go the same way as the gods of Olympus and Walhalla. The extinction of Christianity is but a matter of time.

But Buddhism is on a different and national basis in so far as Buddha does not occupy in it that unique and marvellous place which is assigned to Christ in Christianity. It is seen with the progress of knowledge that there is an unmistakable connection between Buddhism and Agnosticism, Free Thought and Modern Science. Buddhism supplies to these forms that solidarity which a Religion naturally possesses.

Evolution and Periodicity are the lights of Science and of Buddhism; *Solidarity* with the aims and sufferings of others is the leading idea of Socialism and also of Buddhism. The idea of doing good is gradually becoming divorced from belief in a special distribution after death in Heaven and Hell; the world is beginning to do good for its own sake. The law of absolute causality is spreading far and wide, and the idea of an Omnipotent Being, God, Trinity or Power, distributing eternal bliss or punishment, is fading away from an intellectual world.

THE LIFE AND TEACHINGS OF BUDDHA.—

By the Anagarika Dharmapala. This is a clear and concise account of the Life and Teachings of Lord Buddha. Written by a well-known Buddhist authority and in a style specially intended for non-Buddhists, the book is bound to be widely circulated and appreciated. With an appendix and illustrations. Price Rs. 12. To subscribers of the "Indian Review" Rs. 8.

G. A. Natesan & Co., Sunkurama Chetty Street, Madras.

The Queen-Empress.

Sir Clement Kinloch Cooke, M. P. the Editor of the *Empire Review* gives an interesting sketch of Queen Mary in his Journal. He is the author of a larger volume of the life of the Queen-Empress recently published by Thos Nelson and Sons. The book has been praised deservedly by the press. Sir Clement has in this essay given but a brief sketch of the character of the great English Queen. But here is the picture of the little Princess "May"—as she was known and spoken of before her marriage.

"A dear, fat, rosy, pretty child" was the verdict of a lady who saw the royal infant not long after the auspicious event, and writing to a very dear friend, the royal mother says "May is as sweet and engaging a child as you can wish to see, full of life and fun and as playful as a kitten, with the deepest blue eyes imaginable, quantities of fair hair, a tiny rosebud of a mouth, a lovely complexion (pink and white), and a most perfect figure! In a word, a model of a baby! She wins all hearts by her bright face and smile and pretty endearing ways, and is wonderfully forward for her age. I short-coated her late in the autumn, and she looks a perfect picture in her frocks, pinafores and sashes."

In addition to receiving a most careful training and being richly endowed with ability she possessed rare natural gifts and remarkable strength of character. Immensely humane, she is eminently practical while entertaining a true and just appreciation of those lofty ideals which make for happiness and insure success. The Queen is a great reader and revels in the study of books.

The Queen has always been a great reader, and her boudoir at White Lodge contained a little case of her favourite books, prominent amongst them being Tennyson's Poems. Books of travel and biographies are seldom missed, for the Queen does not read for mere passing pleasure, but for instruction and information. Thus before starting on her colonial and Indian tours she perused most of the authoritative books on the countries she was about to visit. Frequently during the travels of her Majesties, astonishment was expressed at the accuracy of the Queen's information and her knowledge of local events. Few ladies have a better or more comprehensive knowledge of English literature than the Queen, while her intimate acquaintance of French and German enables her to keep in touch with the chief works of foreign writers.

Her Majesty is without the least taint of affectation. Her womanly sympathies are of a

high order. The same courteous demeanour is meted out to the rich and the poor, among her friends. Her memory is extraordinarily retentive and her fidelity to her companions old and new alike is very great. The writer concludes:—

No Queen of England ever entered upon her queenly estate better qualified to fill that exalted position than Queen Mary. No Queen ever had a greater hold on the affection of the people. Throughout the Empire, among every class, in every clime, the same opinion is expressed—love, respect and admiration for her lofty ideals, high principles, intellectual power, domesticity and family devotion, strong sense of duty, big warm heart, ever-widening sympathy, and, above all, a reverent regard for religion and simple Bible teaching.

Carlyle and Spencer.

Mr W T Baylis devotes a short essay to a comparison between Carlyle and Herbert Spencer in the March number of *East and West*. Both of them stood apart from the party strifes of their time and held independent views.

Of the two, Carlyle was the more virile, passionate and full-blooded, the nearer akin to common humanity—a man somewhat of the mould of Dr Samuel Johnson. Spencer, on the other hand, bore some resemblance to John Stuart Mill, in being deficient in ordinary human emotions. While Carlyle was overflowing with humour, often of an extraordinary and grotesque description, Spencer was almost devoid of that quality. He was prone to answer a joke with an argument.

Both the philosophers were absolutely antipathetic to each other. The massy disquisitions of Spencer disgusted Carlyle, while the latter's profound creed of hero-worship hardly satisfied Spencer.

Their religions were typical of the two men. Carlyle's faith, though devoid of dogma, was a white-hot, glowing fire, which many a saint might have envied, but which did not satisfy himself. Spencer was a miserable, mouldering taper, which a breath might blow out, but which gave him complete satisfaction. He could always say he was not an atheist, he believed in the Unknown.

Both had a contempt for the House of Commons. Both believed in the importance of individual effort to improve the state. Both advocated peace. While Carlyle was an inspired prophet, Spencer was a well-equipped professor.

The Proposed Moslem University for India.

Dr. A. H. Ewing contributes to the *Moslem World* a very thoughtful and impartial estimate of the influence of "The Proposed Moslem University for India." The argument for a Denominational University are given as follows:—

1. In their own University they will be able to impart religious education more effectively.
2. They will be able to adapt their courses more closely to the needs of their community.
3. They will be able to cultivate, as a teaching University, a type of scholarship which the Indian Universities have not succeeded in promoting. Scholars of distinction and students freed from all care and anxiety as to their livelihood will give and receive, and will together investigate the field of knowledge. What Indian Universities as at present constituted cannot do, they hope to be able to accomplish.
4. They will be able to promote Oriental learning to a degree which is not possible under the more or less artificial aid now given by Government Universities.
5. The recognized advantages of the residential system will be greatly increased when the place of residence becomes in all senses the students' *Alma Mater*.

These are some of the benefits that the Muslim community will derive if the University is established. But what will its effect be on the future of Islam in India? The writer does not believe that it will add to the religious strength of Islam. But

the establishment of such a University will, for the time being at least, increase the prestige of Islam in India. It will doubtless serve as a fitting incentive for further effort and constitute a rallying point for the Mahomedans of the great peninsula. It will supply adequate and imperative reasons why the leaders of the community should come together more often than they do, and such necessary gatherings will constitute additional opportunities for conference upon all questions of importance pertaining to Islam as a religion, and as a political force in India and other parts of the world. These are gains of no mean order to Islam, and are bound to add to political prestige.

Personally the writer does not believe that the enthusiasm of the Muslims for the new University will continue unabated. He fears it will decrease with the growth of time. However, it rests with them whether they will keep abreast of the times or run the risk of losing a great opening for their intellectual achievements and social progress.

Development of Hindu Mythology.

Prof. K. N. Dravid, M. A. traces the growth of some Hindu mythical tales in the current number of *The Fergusson College Magazine*. The origin of some of these tales dates back as far as the time of the Vedas. If we take up any particular myth for treatment, we can "see the first faint beginnings of it in the Rigveda and trace its growth through successive periods of Hindu literature till we come to the Puranas—the great treasure house of mythical tales in India—where the myth is fully developed. The history of a story from the simple Vedic form to the fullness of the Puranic is told as follows:—

The *Rigveda samhita* consists mostly of hymns conveying praises and prayers, benedictions and curses and the like. Thus judging from the general character of its contents it will be seen that there is not much room after all for expecting to find in that *saṃhitā* anything like a narrative or story systematically told. Only there are strokes of description and delineation which involve reference to beliefs and legends, which, however, require to be explained by the earliest interpreters of the *Veda* such as the author of the *Nirukta*, who lived long before the age of the *Puranas*. The same is true of the other *saṃhitās*. In the *Brahmaṇyas*, however, we meet with crude and fantastic narratives interspersed, here and there, in the midst of numerous details of the sacrificial, ritual and fanciful symbolisms to account for the multifarious ritualistic formulae. Even the earliest interpreters of the *Veda* are not explicit enough and require further elucidation such as that supplied by Durga's commentary on Yaska's *Nirukta*. It is not till we come to the two great epics and the *Puranas* that we find ourselves in the realm of legends and narratives systematically related.

The writer takes some similes and illustrations from the earliest writings and proves how they were the beginnings of the more complex and mature productions of a later age. He concludes:—

A much more striking subject for an investigation of the sort attempted in this article would be the rivalry of the asras Vasabha and Vishwamitra as appearing in the Vedic literature and again in the epics and the *Puranas*: how a king named Sudasa seems to have been their patron at different times and how while one of them was in favour with that king, the other was out of favour, how they retaliated each other's wrongs, and in general what were the relations between them as revealed in the *Rigveda*; how, on the other hand, many of these facts look like prototypes of what is related of them in later mythology.

The Gurukula System of Education.

Mr. J. B. Franks writes an interesting letter to the Editor of *The Indian Magazine* on the system of Education that obtains in the Gurukula Pata-shala and suggests some improvements. Writing on the system, the aim and the scope of the Gurukula method of instruction he says —

It bids fair to hold its own against any that I know. What I know of it, and that is not very much, I must confess, bids me say that you have not yet gone beyond the experimental stage. You are training those in your charge, in a way which would preserve in them what is good and true as Indians and lives through long heredity of manners and customs which in the light that obtains to-day is often misconstrued as being unsuitable and even antagonistic to modern times. In a word, I understand the Gurukul has for its most laudable object the establishing of points of contact between the past and present, bringing the past into line with the present so that the priceless seeds of days gone by may not be lost for ever but may be re-sown in fit soil and bear fruit under modern climatic conditions, evolving men who may form the nucleus of the future Indian nation as distinct from the monster that we know to-day.

Regarding the simplicity of life enforced on the pupils, the writer remarks —

The Gurukul rigidly enforces it. The ornamental should never be allowed to trench on the really useful. If we only thought seriously we shall find how little is requisite to supply the necessities of nature. There is an unmitigated and unbroken pleasure in the unthought satisfaction of conversation, society, study, health and common duties of nature and the peaceful reflection on one's conduct, which the feverish empty amusements of luxury and expense cannot compare with. It has been truly said that natural pleasures, indeed, are really without price, both because they are below all price to their attainment and above it in their enjoyment. The young students at Gurukul have all these and happy are they "Happy" I say but let me make a reservation. Happy indeed if they utilize all these, and learn from them what they have to teach.

With such a training and such wholesome habits the young men of the Pata-shala are sure to come off as worthy citizens of the country. But they must also try to be modest with all their character and possibilities of achievement.

One suggestion that the writer makes regarding the method of education will be received in the

spirit in which it is given. So as to make the students really understand modern life and Western thought, it is necessary that more attention should be bestowed on teaching them English. With a command of and an aptitude for English literature and philosophy they will be able to render invaluable services to the cause of humanity.

May I make one suggestion? Let there be more of English in the Gurukul than there is at present. Bring about a condition in which the students may be able to make the English language sufficiently their own to be able to enter into the minds of English writers. No one will deny that England represents the West almost in all things occidental speaking generally. The student who can understand English sufficiently to detect the shades of thoughts and ideas and appreciate them, and is at the same time thoroughly conversant with his own in the right sort on which you can build your hope of the future.

To talk the students of Western Philosophy and Science in Arya Bhasha without their being able to read them in the original for themselves is only to present them the facts with lights and shades of your own mind on the subject. There will be a tendency to uniformity at the expense of individuality with regard to the students, which should be deprecated.

A Fragment on Education

BY J. NELSON FRASER, M.A. (Oxon).

Principal, Secondary Training College, Bombay.

CONTENTS.—Theory and Practice; The Ideals of Education, Psychology, Childhood and Boyhood; Youth and Manhood, What is Education? The Training of the Intellect, The Training of the Feelings; The Training of the Creative Power, Moral Training; Guilt and Punishment, the Sexual Life at School; The Private Hours of Boys, The Teacher and His Pupils; Teaching as a Profession, Education and the Individual; Education and Society, Ten Unsolved Problems of Education; Examination and Grading, The Training of Teachers; The Training of Science, The Importance of Little Things; The English Public School.

Price Re 1 To Subscribers of the "Review," As 12.

SELECT OPINIONS

Ind an Witness — Deserves to be in the hand of every one that has to do with the education of the young, as MISCELLANEOUS, for instance, almost always have.

The Indian Social Reformer — Contains many suggestive and sensible reflections on a variety of topics of practical interest in relation to our schools and colleges. There is a broad sanity about Mr. Nelson Fraser's opinions, which is but seldom found in those of a mere theorist. The book will repay perusal by all who take an interest, not necessarily professional, in the education problems of the day.

G. A. Natesan & Co., Sankarappa Chetty Street, Madras.

QUESTIONS OF IMPORTANCE.

Sir W. Wedderburn on Gokhale's Elementary Education Bill.

Sir William Wedderburn writes in *The Nation* on the Hon. Mr. Gokhale's Elementary Education Bill as follows:—

Replying to the Address of the Calcutta University, King George said:—

"It is my wish that there may be spread over the land a net-work of schools and colleges, from which will go forth loyal and manly and useful citizens, able to hold their own in industries and agriculture and all the vocations of life. And it is my wish, too, that the homes of my Indian subjects may be brightened and their labour sweetened by the spread of knowledge with what follows in its train, a higher level of thought, of comfort, and of health. It is through education that my wish will be fulfilled, and the cause of education in India will ever be very close to my heart."

In these wise and sympathetic words the Sovereign gave expression to the nobler sentiments of the British people in their relation to the Indian people. The educational activities here advocated are what India craves for; and the Royal declaration may be taken as the welcome response to the appeal made on behalf of the masses by Mr. Gokhale, when he pleaded in the Viceroy's Council for his scheme of free and compulsory education:—

"Elementary education," he said, "for the mass of the people means something more than a mere capacity to read and write. It means for them a keener enjoyment of life, and a more refined standard of living. It means the greater moral and economic efficiency of the individual. It means a higher level of intelligence for the whole community generally."

THE EXAMPLE OF OTHER COUNTRIES.

It thus appears that the aspirations of the Indian people, voiced by leading intellectuals, are in exact accordance with the heart-felt wish of King George. The question is: How can this wish be fulfilled; how is a net-work of schools to be spread over the land? The choice as regards primary schools lies between two methods: (a) the system where fees are exacted and attendance is voluntary; and (b) the system where the education is free and the attendance compulsory. All civilised countries have begun with the voluntary system—and abandoned it. In every case experience has shown that no real progress can be made without the element of compulsion. And in her educational methods

Asia is following the example of Europe and America. Success has thus been achieved in Japan; and even in the Philippines, where one-fourth of the inhabitants are still barbarians. There the American Government, working through the municipalities, have introduced the element of compulsion, with the result that the rate of school attendance in the Philippines is said to be ten times as great as that in British India. Coming nearer home, we find satisfactory results of compulsion in Ceylon; while in India itself, an Indian prince, the Garkwar of Baroda, has shown a brilliant example. In 1906, after an experimental stage in selected areas, His Highness made elementary education free and compulsory throughout his dominions for boys from six to twelve years of age, for girls from six to eleven; the result being that in Baroda 79.6 per cent. of such children are now at school, compared with 21.5 per cent. in British India. Such has been the unvarying success wherever elementary education has been free and compulsory. Without compulsion what has been the result in British India? Under the voluntary system the Government, with its best efforts during half a century, still finds that four-fifths of the villages are without a school; that seven-eighths of the children are without elementary education; and that less than 6 per cent. of the population can read and write.

MR. GOKHALE'S SCHEME.

With these facts before us, it seems clear that only by making elementary education free and compulsory can the Royal wishes and the aspirations of the Indian people be adequately fulfilled. Sooner or later, a new departure must be made. Has the time come; and are the general circumstances now favourable for a cautious and experimental step forward? Let us consider the case for early action, as represented by Mr. Gokhale's Bill, together with the objections raised on the other side. Mr. Gokhale's scheme is purely permissive. Briefly stated, its object is to give power, under carefully guarded conditions, to municipalities and district boards to make elementary education free and compulsory within their local areas, all reasonable opportunities for control being reserved for the Government. These conditions seem prudent and well suited to present circumstances, providing as they do for a gradual extension of the system in those localities where it commends itself to the approval of the people. And looking to the general purposes of the Bill, we must find it highly gratifying that the first fruits of Lord Morley's reformed Councils should take the form

of a generous scheme initiated by the educated class for the benefit of the unlettered masses; a scheme framed by so experienced an educationist as Mr. Gokhale, on the most approved scientific lines. By taking the initiative, the Indian reformers seek to co-operate with the Government in approaching a difficult and delicate public duty; taking upon themselves, instead of leaving to the Government, any unpopularity which may arise from compulsion, or from the imposition of an educational rate.

THE OFFICIAL OPPOSITION.

Unfortunately, the Bill, in its present form, is opposed by all the heads of the local administrations. The unanimity in their verdict is remarkable, though the reasons given for their conclusions differ very widely, varying from that of the Lieutenant Governor of Burma, who considers that elementary education has made so much progress that no compulsion is required, to that of the Lieutenant Governor of the Punjab who reports that the majority of the people are "strongly opposed not merely to compulsion, but to any education whatsoever." The Governor of Madras admits that "the most pressing need in India at the present time is the wider diffusion of education," but he sees objections to every provision of the Bill, which he considers "unnecessary, premature, and open to objections of a serious character on educational, political, and financial grounds." On the other hand, the Lieutenant-Governor of Bengal "sees no objection *per se* to the principle of compulsory education, which is a recognised policy of European Government"; but he holds that the immediate enforcement of elementary education would be attended with the gravest dangers. The Lieutenant-Governor of the United Provinces recognises "the high aims and the unselfish zeal" of Mr. Gokhale, but he regards the principle of compulsion as "impossible," and fraught with serious danger.

The printed official reports of the seven local administrations, with their enclosures, are very voluminous and difficult to summarise, looking to the discordant nature of the arguments advanced. I will, therefore, take the despatch of the Bombay Government as typical of the others, and briefly state the main facts of the case. The proposition of the Bombay Government is that Mr. Gokhale's scheme cannot be accepted unless it would (1) "be in harmony with the policy of Government (2) would be politically desirable; and (3) would ensure the progress of education among the classes most in need of it."

THE ACCEPTED POLICY.

Let us take each of these points in turn. As to the accepted policy of the Imperial Government regarding elementary education, there is no doubt. So far back as 1854 Sir Charles Wood's famous Minute gave a foremost place to the education of the masses. The same policy was emphasised in the recommendations of the Education Commission of 1883. In 1904 Lord Curzon placed it on record that primary education had "hitherto received insufficient attention and an inadequate share of the public funds." And as directly bearing on the present controversy, we have the declaration of the present Secretary of State for India. On July 27 last, the Marquis of Crewe, speaking in reply to a deputation which presented to him a Memorial in support of Mr. Gokhale's Bill, concluded as follows:—

"I am glad to be able to say in reply to you that we have always viewed the objects you favour with unbounded sympathy. This question of education has been given, and is receiving, much close consideration and anxious thought on the part of the Viceroy and his advisers and of myself here. I can assure you that we regard with the utmost sympathy every attempt which is made, as this is made, on reasonable and modern lines to attempt to cope with the tremendous difficulties which exist in the absence of anything like a complete system of primary education in India, which is perhaps the greatest reproach which exists against the British system of government in India. It is impossible for me to say more, but I can assure you of my own warmest sympathy, and can promise you the sympathy of the Government of India on this subject of paramount importance."

As to the present unhappy condition of primary education, there is no difference of opinion. The Bombay Government admit that "the illiteracy of the masses in India is made a constant reproach against British rule." All are agreed as to the diagnosis of the disease. The difference of opinion arises as regards the remedy to be applied. On the one hand, we have the scientific method. Universal experience is in favour of making elementary education free and compulsory; and this is the principle embodied in Mr. Gokhale's Bill. On the other hand, the Bombay Government are content to continue the voluntary system, which has been discarded in all civilised countries; and object strongly to elementary education being made either compulsory "in any form," or free by the abolition of fees. As between these contentions,

what is the policy of His Majesty's Government? It is clearly in favour of a new departure. What is now wanted is a vigorous move forward on scientific lines; and, as regards the method, Lord Crewe has specifically expressed sympathy with Mr. Gokhale's scheme, which he speaks of as being "one of almost extreme moderation." On the first point, therefore we must hold that it is the Bombay administration, not Mr. Gokhale, that is out of "harmony with the policy of Government."

IS THE BILL DESIRABLE?

The next point is whether the Bill is politically desirable, and the adverse judgment seems to rest mainly on the allegation that Indian public opinion is strongly hostile. The Bombay Government assert that compulsion would be "certain, in the peculiar conditions of India, to arouse the deepest resentment." When the partition of Bengal caused popular resentment, hundreds of protest meetings were held, and the resolutions passed expressed strong feeling. Where is now the evidence of such a feeling? The Bombay correspondence certainly contains no such evidence. The despatch gives a summary of opinions called for by the Government, and these do not record the smallest manifestation of popular displeasure. On the contrary, non-official opinion, as reported, seems overwhelmingly in favour of the Bill. Moreover, the persons selected by the Bombay Government for consultation were largely officials and Europeans, and they evidently were not so capable of expressing the popular feeling as the people themselves. Yet, even among those consulted, opinion was much divided. The Director of Public Instruction and the Educational Officers, except in Sind, are willing that the experiment of free and compulsory education should be tried where the conditions seem favourable. The Commissioner of the Northern Division is favourable. He remarks that in Gujerat, with the example of Baroda so close, it is desirable to have the power to introduce compulsory education; otherwise comparisons will be drawn, to the disadvantage of the British Government. He summarises the opinions of the Collectors of his division, from which it appears that all except one are in favour of the Bill. The Commissioner of the Central Division is against the Bill, and carries with him the majority of his Collectors. There is no report of the Collector of Poona, and the Collector of West Khandesh is favourable. This Commissioner admits that "the non-officials consulted by the Collectors are apparently without exception in favour of the Bill." The Commissioner of the Southern Division is favourable; of the Collectors, three are unfavourable, two fa-

vourable, and one doubtful. Of the twenty-five non official members of the Governor's Legislative Council, eighteen are favourable, and seven against. The Chairman of the Poona School Board reports that the School Board are unanimously in favour of the Bill. And, finally, all the public meetings held were unanimous and enthusiastic in its support. Of these public meetings, two were of the backward classes, held in Bombay and Poona; two of the mill-hands in Bombay; two of the citizens generally at Ahmedabad and Broach. There is no record of any public meeting in opposition to the Bill. On the second point, therefore, it may be said that, so far as the evidence of popular feeling goes, there is nothing to show that the scheme is not politically desirable.

WILL PROGRESS BE ENSURED?

There remains to consider the third point, whether the Bill would ensure the progress of education among the classes most in need of it? Under this heading, the most important plea of the Bombay Government is that education is essentially a matter for local administration; that at present it is entirely controlled by the Local Government; that the provisions of the Bill are not compatible with the Bombay system; and that All-India legislation on this subject would be a retrograde step, leading to excessive centralisation. The Bombay Government state that they are now elaborating plans for a wide extension of primary education; and they claim that legislation in this department should be undertaken by the expanded Provincial Councils. There is force in this plea for Provincial legislation; and the Bombay Government should lose no time in placing their scheme before the world. It appears that they are not altogether averse from adopting the provisions of Mr. Gokhale's Bill in a modified form; and their scheme will, no doubt, receive popular welcome, provided always that it conforms to the policy of the Imperial Government, and commands itself to educated Indian opinion.

THE QUESTION OF UNPOPULARITY.

As noted above, the objection to Mr. Gokhale's Bill raised by the various local governments are divergent. But in one respect the despatches are in unison. They all betray a somewhat unheroic dread of incurring unpopularity. And this nervousness is the more remarkable because the reports do not disclose any evidence of popular disapproval. On the contrary, all the expressions of public opinion seem strongly in favour of the Bill. Besides the public meetings in the Bombay Presidency already referred to, we find reports in

the Press of twelve meetings held in the Bengal Provinces, with resolutions passed in support of the Bill, including one by the Bengal Provincial Conference, and one by the Bihar Landholders' Association. In the United Provinces eleven meetings are reported, including those held in the leading cities, such as Lucknow, Cawnpore, Agra, Benares, and Allahabad. In the Punjab six meetings, including favourable resolutions by the Moslem League at Lahore and Multan. In the Madras Presidency there were public meetings in all the leading towns; and in Madras itself, besides a public meeting of citizens, there were favourable resolutions by the Senate and Corporation, and by the Moslem League. In the Central Provinces and Berar there have been similar meetings at Nagpur and Amraoti. In face of this evidence of popular approval, it is difficult to understand why the local Governments are so timid. Their distrust of the people does not seem at all justified. Indeed, it is an injustice to the intelligence of the Indian community to assume that they will resent a measure for the benefit of the masses, which, though in a certain sense drastic, is purely benevolent and unselfish.

In the meantime, we learn that the Bill has been thrown out in the Viceroyal Council, in deference no doubt to the opposition of the local Governments. Mr. Gokhale (though in weak health) intends to proceed to England in order to plead the cause of his people, and no doubt British public opinion will endorse the wise and generous views of the Sovereign and his advisers. The best Indian public opinion on this vital question is summed up in the Minute recorded, as his last great service to India, by my lamented friend the late Hon. V. Krishnaswami Iyer, the Indian Member of the Madras Government. Dissenting from his colleagues he said:—

"The conclusion to which I have come is that the Bill is desirable and necessary; that it is conceived in the best interests of education; that there is no reasonable probability of political or other danger arising from its enforcement; that it will largely accelerate the pace of educational progress. . . . It seems to me that real political danger lies in resisting a large mass of enlightened opinion supported by European missionaries and by large numbers of Englishmen connected with the administration of the country, so as to leave an abiding source of irritation and bitterness and a standing theme for a widespread public agitation which cannot make for the peace and good government of the country."

UTTERANCES OF THE DAY.

Mr. Montagu on "India"

In his capacity as President of the Cambridge and County Liberal Club, the Hon. Mr. E. S. Montagu, M. P., Under Secretary of State for India addressed a large gathering at the Guildhall on the 28th February. After devoting a portion of his speech to domestic questions he continued:—

THE TURN OF INDIA.

Well, then, when these principles of self-Government had been applied in their most extreme form, came the turn of India, when Lord Morley introduced his Indian Councils Act in 1909. Here was no far reaching scheme, here was no reckless experiment, merely a cautious attempt to associate the governed with the governor and to give expression to popular opinion in India. And we had the late Lord Percy in the House of Commons saying 'Therefore, although it is our duty to warn the Government of the dangers which in our opinion attend many of the steps which we are recommending, the responsibility of acting upon or neglecting the warning must rest with the Government themselves.' And we had the usual carping criticism of Lord Curzon. Well, nobody can doubt the success of the Indian Councils Act, but still the Conservatives have learnt no better. The latest efforts in Imperial workmanship were the far-reaching reforms announced the other day at Delhi as the central feature of His Majesty's successful visit to his Indian dominions. It would be improper for me to discuss these reforms without prefacing my remarks with a word of my own personal belief that the great outstanding triumph of that Indian tour was the personality of King George himself. The good results of his gracious voyage to India will long outlive the pleasure afforded the Indian people by the opportunity of demonstrating their overwhelming loyalty to the British Throne. But what of our policy, what of the new provinces and Delhi? You have invited a Departmental Minister to occupy the office of President, and you have so brought it upon your heads that I should take, as I am bound to take this, an opportunity which does not assert all with the theme of our discussion, of answering the critics of that scheme.

THE DURBAR ANNOUNCEMENTS

In the House of Commons Mr. Bonar Law dismissed it with two criticisms: firstly, that it

would cost money; and, secondly, that the reversal of the partition of Bengal, as he called it, was a damaging blow to our prestige. I would say in passing that the complaint about expense as the first objection to a great Imperial measure is typical of modern Conservatism. To them, ideals, poetry, liberty, imagination are unknown; they reduce Empire to a profit and loss account, their ideal is one of a cash nexus, and a million or two is to them far more important than the fact that the transfer of capital provides India with a new city, in a historic place, amid the enthusiastic welcome of the whole of a tradition loving people. And as for prestige—O India, how much happier would have been your history if that word had been left out of the English vocabulary! But there you have Conservative Imperialism at its worst: we are not there, mark you, to repair evil, to amend injustice, to profit by experience—we must abide by our mistakes, continue to outrage popular opinion simply for the sake of being able to say, 'I have said what I have said.' I have in other places and at other times expressed my opinion freely on prestige. We do not hold India by invoking this well mouthed word; we must hold it by just institutions, and more as time goes on by the consent of the governed. That consent must be based on the respect which we shall teach them for the progressive justice of the Government in responding to their legitimate demands. But Mr. Bonar Law knows nothing of India, as he will be the first to admit, and it is to the House of Lords that we must turn for a more exhaustive criticism of our proposals.

LORD CURZON'S ATTITUDE.

And here we come face to face with the great Lord Curzon himself. Now, sir, no one who has held my office for two years would be absurd enough to speak on a public platform upon this topic without paying a tribute to the great work Lord Curzon has done for India. His indomitable energy, his conspicuous courage, his almost unrivalled self-confidence have placed India under a lasting debt to him. But I would venture with all respect to ask how has he spent his time since? Admiring what he has done, not looking and saying, 'We have done this,' but saying, 'This is my work.' In the lengthy speech which he delivered last week in the House of Lords he did lip-service to Parliamentary control but notwithstanding the fact that Lord Middleton was sitting next him, notwithstanding the fact that it was Mr. Brodrick as he then was, not Lord Curzon, who was technically responsible for a large part of

the Curzonian administration, he never mentioned the Secretary of State in the whole course of his speech, nor did Lord Middleton speak himself. Lord Curzon has chosen as a point of survey, for the work of which he is so proud, a point in which he is in his own light, and his shadow is over everything that he has done. It is not 'Hands off India' that he preaches: it is 'Leave Curzonian India as Lord Curzon left it.' To alter anything that Lord Curzon did would be damaging to our prestige. I want to ask you in all seriousness what would be the first criticism which a man wholly ignorant of India—the man in the street—would make to Lord Curzon's speech? I think he would say: 'We read of the welcome given in India and in England to this scheme by statesmen, soldiers, civil servants, by speech and by Press of all parties, and we know, therefore, that it is not wholly bad.' Therefore, am I not justified in discounting the whole of Lord Curzon's speech by the fact that, although he went into exhaustive details, although he knew the sensitive nature of Indian opinion, the way in which his words would be telegraphed throughout India, although he did not hesitate to bolster up his case with a gossiping story which, as he told it, was obviously untrue and for which he could not state his authority in public, he had no word of praise of any sort or kind either for the conception of our policy or for any detail by which it was carried out—(applause)—although he spoke even longer than I am speaking to-night; he curses it from beginning to end; he curses it for what it did and for how it was done; he curses it because we did it without consulting him—Oh, horror of horrors!—and because it ended something which he had done; he cursed it because His Majesty the King was graciously pleased himself to announce it to his people assembled at the Durbar at Delhi. I say again that these are not the grave and weighty criticisms of a statesman: they are the impetuous, angry fault-findings of a man thinking primarily of himself.

THE STORY OF 1905.

"May I take his criticisms in a little more detail? He objected to His Majesty making the announcement because, he said, that made it irrevocable. Well, educated India reads with full knowledge the words of His Majesty's proclamation: 'I make this change on the advice of my Ministers,' and knows what is meant by a constitutional monarch, and that blame, if there be blame, and credit, if there be credit, must be laid at the door of his Majesty's advisers. Lord Curzon complains that

the Press of twelve meetings held in the Bengal Provinces, with resolutions passed in support of the Bill, including one by the Bengal Provincial Conference, and one by the Bihar Landholders' Association. In the United Provinces eleven meetings are reported, including those held in the leading cities, such as Lucknow, Cawnpore, Agra, Benares, and Allahabad. In the Punjab six meetings, including favourable resolutions by the Moslem League at Lahore and Multan. In the Madras Presidency there were public meetings in all the leading towns; and in Madras itself, besides a public meeting of citizens, there were favourable resolutions by the Senate and Corporation, and by the Moslem League. In the Central Provinces and Berar there have been similar meetings at Nagpur and Amraoti. In face of this evidence of popular approval, it is difficult to understand why the local Governments are so timid. Their distrust of the people does not seem at all justified. Indeed, it is an injustice to the intelligence of the Indian community to assume that they will resent a measure for the benefit of the masses, which, though in a certain sense drastic, is purely benevolent and unselfish.

In the meantime, we learn that the Bill has been thrown out in the Viceregal Council, in deference no doubt to the opposition of the local Governments. Mr. Gokhale (though in weak health) intends to proceed to England in order to plead the cause of his people, and no doubt British public opinion will endorse the wise and generous views of the Sovereign and his advisers. The best Indian public opinion on this vital question is summed up in the Minute recorded, as his last great service to India, by my lamented friend the late Hon. V. Krishnaswami Iyer, the Indian Member of the Madras Government. Dissenting from his colleagues he said:—

"The conclusion to which I have come is that the Bill is desirable and necessary; that it is conceived in the best interests of education; that there is no reasonable probability of political or other danger arising from its enforcement; that it will largely accelerate the pace of educational progress. . . . It seems to me that real political danger lies in resisting a large mass of enlightened opinion supported by European missionaries and by large numbers of Englishmen connected with the administration of the country, so as to leave an abiding source of irritation and bitterness and a standing theme for a widespread public agitation which cannot make for the peace and good government of the country."

UTTERANCES OF THE DAY.

Mr. Montagu on "India."

In his capacity as President of the Cambridge and County Liberal Club, the Hon. Mr. E. S. Montagu, M. P., Under Secretary of State for India addressed a large gathering at the Guildhall on the 28th February. After devoting a portion of his speech to domestic questions he continued:—

THE TURN OF INDIA.

Well, then, when these principles of self-Government had been applied in their most extreme form, came the turn of India, when Lord Morley introduced his Indian Councils Act in 1909. Here was no far reaching scheme, here was no reckless experiment, merely a cautious attempt to associate the governed with the governor and to give expression to popular opinion in India. And we had the late Lord Percy in the House of Commons saying 'Therefore, although it is our duty to warn the Government of the dangers which in our opinion attend many of the steps which we are recommending, the responsibility of acting upon or neglecting the warning must rest with the Government themselves.' And we had the usual carping criticism of Lord Curzon. Well, nobody can doubt the success of the Indian Councils Act, but still the Conservatives have learnt no better. The latest efforts in Imperial workmanship were the far reaching reforms announced the other day at Delhi as the central feature of His Majesty's successful visit to his Indian dominions. It would be improper for me to discuss these reforms without prefacing my remarks with a word of my own personal belief that the great outstanding triumph of that Indian tour was the personality of King George himself. The good results of his gracious voyage to India will long outlive the pleasure afforded the Indian people by the opportunity of demonstrating their overwhelming loyalty to the British Throne. But what of our policy, what of the new provinces and Delhi? You have invited a Departmental Minister to occupy the office of President, and you have so brought it upon your heads that I should take, as I am bound to take this, an opportunity which does not assert ill with the theme of our discussion, of answering the critics of that scheme.

THE DURBAR ANNOUNCEMENTS

In the House of Commons Mr. Bonar Law dismissed it with two criticisms: firstly, that it

would cost money; and, secondly, that the reversal of the partition of Bengal, as he called it, was a damaging blow to our prestige. I would say in passing that the complaint about expense as the first objection to a great Imperial measure is typical of modern Conservatism. To them, ideals, poetry, liberty, imagination are unknown; they reduce Empire to a profit and loss account, their ideal is one of a cash nexus, and a million or two is to them far more important than the fact that the transfer of capital provides India with a new city, in a historic place, amid the enthusiastic welcome of the whole of a tradition-loving people. And as for prestige—O India, how much happier would have been your history if that word had been left out of the English vocabulary! But there you have Conservative Imperialism at its worst: we are not there, mark you, to repair evil, to amend injustice, to profit by experience—we must abide by our mistakes, continue to outrage popular opinion simply for the sake of being able to say, 'I have said what I have said,' I have in other places and at other times expressed my opinion freely on prestige. We do not hold India by invoking this well mouthed word; we must hold it by just institutions, and more as time goes on by the consent of the governed. That consent must be based on the respect which we shall teach them for the progressive justice of the Government in responding to their legitimate demands. But Mr. Bonar Law knows nothing of India, as he will be the first to admit, and it is to the House of Lords that we must turn for a more exhaustive criticism of our proposals.

LORD CURZON'S ATTITUDE.

And here we come face to face with the great Lord Curzon himself. Now, sir, no one who has held my office for two years would be absurd enough to speak on a public platform upon this topic without paying a tribute to the great work Lord Curzon has done for India. His indomitable energy, his conspicuous courage, his almost unrivalled self-confidence have placed India under a lasting debt to him. But I would venture with all respect to ask how has he spent his time since? Admiring what he has done, not looking and saying, 'We have done this,' but saying, 'This is my work.' In the lengthy speech which he delivered last week in the House of Lords he did lip-service to Parliamentary control but notwithstanding the fact that Lord Middleton was sitting next him, notwithstanding the fact that it was Mr. Brodrick as he then was, not Lord Curzon, who was technically responsible for a large part of

the Curzonian administration, he never mentioned the Secretary of State in the whole course of his speech, nor did Lord Middleton speak himself. Lord Curzon has chosen as a point of survey, for the work of which he is so proud, a point in which he is in his own light, and his shadow is over everything that he has done. It is not 'Hands off India' that he preaches: it is 'Leave Curzonian India as Lord Curzon left it.' To alter anything that Lord Curzon did would be damaging to our prestige. I want to ask you in all seriousness what would be the first criticism which a man wholly ignorant of India—the man in the street—would make to Lord Curzon's speech? I think he would say: 'We read of the welcome given in India and in England to this scheme by statesmen, soldiers, civil servants, by speech and by Press of all parties, and we know, therefore, that it is not wholly bad.' Therefore, am I not justified in discounting the whole of Lord Curzon's speech by the fact that, although he went into exhaustive details, although he knew the sensitive nature of Indian opinion, the way in which his words would be telegraphed throughout India, although he did not hesitate to bolster up his case with a gossiping story which, as he told it, was obviously untrue and for which he could not state his authority in public, he had no word of praise of any sort or kind either for the conception of our policy or for any detail by which it was carried out—(applause)—although he spoke even longer than I am speaking to-night; he curses it from beginning to end; he curses it for what it did and for how it was done; he curses it because we did it without consulting him—Oh, horror of horrors!—and because it ended something which he had done; he cursed it because His Majesty the King was graciously pleased himself to announce it to his people assembled at the Durbar at Delhi. I say again that these are not the grave and weighty criticisms of a statesman: they are the impetuous, angry fault-findings of a man thinking primarily of himself.

THE STORY OF 1905.

"May I take his criticisms in a little more detail? He objected to His Majesty making the announcement because, he said, that made it irrevocable. Well, educated India reads with full knowledge the words of His Majesty's proclamation: 'I make this change on the advice of my Ministers,' and knows what is meant by a constitutional monarch, and that blame, if there be blame, and credit, if there be credit, must be laid at the door of his Majesty's advisers. Lord Curzon complains that

what the king has said is irrevocable; so I hope it may be, but if it had been made by the Viceroy, Lord Curzon would have said it is irrevocable, and surely what is said by the Viceroy on the King's behalf is as irrevocable as what the King said. In fact, as the Prime Minister said, 'What Lord Curzon might do in Lord Curzon's opinion His Majesty the King ought not to do' (Laughter and applause.) Then he asks why Parliament was not consulted. It is a little curious that he should blame us in this regard, for he objects to our having reversed, as he says, a policy of his. Lord Curzon's partition of Bengal was an accomplished fact before any discussion in the House of Commons had taken place. Mr Herbert Roberts asked Mr Brodrick on July 5, 1905, a question, and was told 'The proposals of the Government of India on this subject reached me on February 18, and I have already communicated to them the decision of the Secretary of State in Council accepting the proposals.' But the proposals themselves were not divulged. Mr Roberts, having moved the adjournment of the House on the question of the partition, withdrew his motion on Mr Brodrick's promising to lay further papers. The recess intervened, during which the proclamation, which finally constituted the new provinces, was issued, and when Mr Roberts protested against this treatment he received from Mr Brodrick a letter from which I quote the following passage: 'You will remember that when the discussion took place in the House of Commons the scheme put forward by the Viceroy had already received the assent of the Home Government, and the resolution of the Government of India embodying the scheme has been published and presented to Parliament.' Again, Lord Curzon says that the decision in the case of his partition was announced after a Blue-book full of information had been for months in the possession of Parliament. What are the facts? After despatches had been passed, between the Government of India and the Secretary of State, the decision was announced in a resolution of the Government of India, dated July 19, 1905. The resolution was presented to Parliament in the form of a White paper on August, 7, and a Blue-book, containing further papers, was presented on October 12—i.e., almost three months after, not months before, the announcement of the decision.

THE REAL RESPONSIBILITY

The fact of the matter is, the Secretary of State is responsible to the House of Commons, and the House of Commons can censure him or the Cabinet

just as much as it could have done if the Viceroy had made the announcement. The House of Commons has never claimed more than a general control over the Government of India; therefore announcements such as the partition of Bengal, and new administrative changes which must be made suddenly and by proclamation, conflicting interests, conflicting claims having to be balanced and adjusted, public discussions would make them difficult, if not impossible, of accomplishment; and that is why the British and the Indian Constitution retain the Royal proclamation as a method of bringing about such changes as this in India or the self government of the Transvaal.

WHY THE PARTITION WAS REVERSED

Next, Lord Curzon stated that our policy involved a reversal of his policy. I trust Lord Curzon will forgive me for saying that he never had a policy at all (Laughter and applause.) He was a mere administrator, an industrious, fervid, and efficient administrator. He was, in a word, a chauffeur who spent his time polishing up the machinery, screwing every nut and bolt of his car ready to make it go, but he never drove it, he did not know where to drive it to. (Applause.) He merely marked time and waited until a reforming Government gave marching orders. If he were to claim that the partition of Bengal was more than an administrative measure, designed as a part of a policy, then I say that it was even a worse mistake than I thought it, for the making of a Mahomedan State was a departure from accepted British policy which was bound to result in the antithesising and antagonising of Hindu and Mahomedan opinion. I had always hoped that this was the unforeseen result, and not a deliberate achievement, of Lord Curzon's blunder. It has always been the proud boast of English rule in India that we have not interfered between the different races, religions, and creeds which we found in the country. That he himself regarded the partition as not more than a mere matter of local administrative convenience may be gathered from the passage in his speech in which he says that, owing to the size of the old province of Bengal, it had become necessary to draw a line dividing it into two; and he goes on to say, 'what was the particular line to be drawn was a matter not for the Viceroy.' The creation of a vast new province, the meddling with the lives of millions of people, with all the possibility of offending religious and racial susceptibilities, not a matter for the Viceroy! He looked no further than the necessity

INDIANS OUTSIDE INDIA.

The Cry of the Transvaal

BY MR N GUPTA.

(Editor, 'Tribune,' Lahore)

1

Athwart the main to the shores of Ind came the
 long drawn cry
 'Mother, not distance nor clime moves our
 faith in thee;
 Thy sons and thy daughters through the cycle of
 births,
 Through the valley of death thy beacon lights
 us from afar,
 Thy name dwells on our lips in life as in death.

2

Not lust of conquest, nor greed of land
 Lured us from thy lap, but the desire
 To ease thy burden and to bear our own,
 Unforgetting thee and thine and the heritage
 of our race,
 Following the flag that floats and turns o'er to
 the sun.

3

O England, thou Mother of Liberty, freest of the
 free,
 Be these thy sons and the fellows of thy sons—
 Men in whom the divine sleeps and the brute
 awakes to life,
 Who profess the Christ and outrage the
 Son of Man,
 And seek the pigment of the skin in the image
 of God?

4

For in the name of the law and justice divine
 They have sought to brand us with the mark
 of Cain,
 Ranking us with the thief, and the outlaw, and
 the fallen;
 And holding us lower than the lowest, and
 viler than the vilest,
 And all for the crime of the colour that is brown
 and not blanche.

5

We are a handful among a host, unsheltered,
 Unheard, seeking the justice that is not.
 But we spring from a race that stands for the
 Brahman among the nations;
 And we have learned from thee to suffer but
 not to be shamed,
 To be patient but not degraded, to be resolute and
 to die.

6

What if they have put on us the convict's garb,
 Condemned us to convict labour and the
 convict's food!
 What if they have exposed us in fetters in the
 sight of men!
 Our souls are unfettered and our spirits are
 free
 We have not shamed thee, for theirs the shame.

7

Give us of thy soul power to suffer and yield not;
 Lay on us thy healing hand, give us balm of
 thy grace
 That to the end we sustain the good fight
 Uncomplaining, unconquered—the fight of the
 dauntless soul,
 Against the flouts and contumely of an arrogant
 race

8

Behold, our sufferings shall be the mantle of thy
 glory;
 The union of our handful the union of the race;
 The chastening of our flesh shall bring the brother-
 hood of man,
 Our ordeal the forerunner of the peace of the
 earth
 When thou shalt hold the lamp of love in the
 sons to be!

THE INDIANS OF SOUTH AFRICA.—Helots
 within the Empire! How they are Treated By H. S. L.
 Polak. This book is the first extended and authoritative
 description of the Indian Colonists of South Africa, the
 treatment accorded to them by their European fellow-
 colonists, and their many grievances. Price Rs 1. To
 Subscribers of the "Indian Review," Rs. 12.

Female Education in Bhopal.

With reference to the various inquiries that have reached H. II. the Begam of Bhopal regarding the Girls School she has proposed in commemoration of Queen Mary's visit to Delhi, she wishes to say that the school in question is intended for the girls of rich as well as poor families without distinction of nationality or religion. The school will welcome girls of all classes, and it is intended to provide in the Boarding house accommodation benefitting the social position of the girl students. Her Highness has not the remotest intention of restricting the school to girls of Delhi or of any one place, for such restrictions would, in her opinion, militate against the success of her scheme, and she sees no reason why girls from any part of India should not be eligible.

It is too early as yet to lay down the lines on which the education in the proposed institution will proceed. This matter as well as others connected with the management of the institution Her Highness will leave to the Committee of educational experts whose advice will have to be taken regarding the draft scheme which Her Highness has prepared and sent to Press and which will soon be in the hands of her friends.

A History of the Rajkumar College

His Highness Sir Bhavsinhji, K. O. S. I., the Maharaja of Bhavnagar, has compiled a somewhat remarkable book. It is a history of Rajkumar College, at Rajkot, a well known educational institution of India. We should imagine the history of few schools to have been dealt with in a more lavish or more sumptuous fashion than Rajkumar College in this handsomely produced publication. No less than seven volumes are required to complete the work in the way in which the Maharaja has desired it to be put before the public. His volumes are freely illustrated with scores of full page photographs and portraits, and each page has a decorative border enclosing the

letterpress. The Maharaja is an old boy of the College, and has evidently a similar love and devotion for his college and for the memory of its first Principal, the late Mr. Chester Macnaghten, to that of old boys in Great Britain for their public schools. The publication is entirely due, indeed, to the generous affection of the Maharaja for the college, and he is fired with the praiseworthy desire to inspire past and present students with the same ardent affection. "Forty Years of the Rajkumar College," which is dedicated to Sir George Sydenham Clarke, the Governor of Bombay, has been prepared and abridged from the papers of Mr. Macnaghten and from other accounts of the chief events in the history of the college, newspaper cuttings and reports and so on. We pay a tribute to the disinterested labour, which must have been very great, of all those—notably the Maharaja of Bhavnagar himself—who have taken a hand in compiling what is an exceedingly interesting record of a famous school. The College, it may be explained, is one of two or three seminaries established in India under the guidance of the British Government for the training and education of sons of Chiefs. The work of such a College is bound to be of no little value, and many people in this country will like to learn much, which they certainly will do, from a perusal of these volumes concerning a school of the importance of Rajkumar College. We are glad to know that every kind of British sport is indulged in by the students. There are numerous photographs of cricket and football teams, and many pages are given to descriptions of the sporting side of the life of the college. These are not the least entertaining portions of the history. Both old and present students will thank the Maharaja for the immense pains which he has taken in compiling this record. The volumes are intended for private circulation but may be obtained from Messrs. John Dickinson, 65, Old Bailey, E. C.—*Saturday Westminster Gazette*.

Cotton Mills in India and Japan

There is a very interesting article in a recent number of the *Engineering* on "Cotton Mills in India and Japan," and from the Indian point of view the figures quoted are most satisfactory. They show that though Japanese competition is undoubtedly a factor to be reckoned with, yet the progress of the cotton industry in India has been more rapid than in Japan. Take, for example these figures. In 1890 India possessed 3,274,196 spindles and in 1898, 5,756,020, an increase of 2,481,824. During the same period the spindles in Japan increased from 277,895 to 1,611,168, an increase of 1,333,273. The pessimistic critic will no doubt point out that the rate of increase in Japan is greater than the rate of increase in India; but that is almost inevitably the case when a comparatively new industry is competing with an older established one. A boy grows more quickly than a man. The really important consideration is the amount of increase, and it will be observed that the amount in India is almost double the amount in Japan. An even more satisfactory story is told with regard to weaving. The cotton power looms in India increased during the period under review from 23,412 to 67,920, while in Japan, according to the latest figures, the number of power-looms has not yet reached more than 14,000. In the article from which we are quoting it is further pointed out that the increase in the number of looms in India is proportionately greater than the increase in the number of spindles, which shows that, in spite of the much abused excise duties the manufacturing branch of the Indian cotton industry is steadily gaining ground. As an offset against these satisfactory figures, the *Engineering* points out that according to careful statistics which have been prepared, the efficiency of the Japanese operative appears to be considerably greater than that of the Bombay operative.

Bombay Cotton-Mill Industry.

Discussing the prospects of the cotton mill industry in Bombay, Mr. Satis Chandra Bose points out in the *Modern Review* that with all the facilities for a thriving business, it is not made to pay as much as possible owing to lack of methods on the part of those who deal in cotton either as mill owners or growers of cotton. He writes:—

But although the development of the home market may not be an impossible task, it is by no means an easy matter. If the thirty crores worth of piece goods annually imported into the country are at any time to be displaced by home made cloth, efforts will have to be made to improve the quality of the home products and to reduce their price. But in this behalf a plentiful supply of raw cotton of the American type at a low price is a requirement of prime importance. It is agreed in authoritative circles that, so far as the physical properties of the soil are concerned, India can produce fine cotton of the American type. Although attempts latterly made to grow Egyptian cotton in Sind have not proved very encouraging, experiments in superior cotton made on Government farms in many places have been successful. Experts have expressed the opinion that India which could at one time produce cotton of the highest quality can again be made to grow the old fine quality provided up to date methods are adopted in its cultivation. What is needed is intensive organisation of the cultivators under the leadership of experienced businessmen of broad commercial and financial knowledge, and, where possible, institution of large cotton farms, and ample irrigation facilities. Such organisation is not impossible, and Government would do all in their power to afford irrigation facilities.

The Pearl Trade.

According to the Paris correspondent of the *New York Times*, the merchants of India have obtained control of the Eastern Fisheries, and this has led to a great increase in the price of pearls. He writes:—

"It is to be feared that Americans who have not been to Europe for a few seasons and contemplate buying jewellery in Paris this year will experience an unpleasant surprise owing to the remarkable rise in the value of pearls. This is a frequent topic of conversation among the wealthier classes of Americans and the French people here, and it is complained that these gems now command nearly double the price which they did not long ago, although the supply shows no signs of running short.

"A number of inquiries made among the leading precious stone merchants in the Rue de la Paix of Paris, which of course, is the central market of the world in this line, led to some interesting revelations.

"The dealers all agree that the prices obtained are far higher than, say, six years ago, but various explanations were given. One of the most plausible and at the same time most authoritative of these is that the market is being manipulated by a ring of pearl merchants in India, who have combined to control the fisheries of Ceylon and the Persian Gulf and are restricting the supplies of Europe, thus artificially raising values.

"It is considered that the ring is strong enough to maintain a corner for sometime to come and that there is thus little chance of the present prices falling much in the near future.

"Another reason offered is that much difficulty is experienced in obtaining these gems, owing to the fact that the shallower beds are now becoming devoid of oysters, owing to the popularity of pearls.

"Enormous prices are now frequently given here. The largest amount paid for a single gem is stated to be \$175,000 (£35,000), which changed hands in a recent transaction.

"Those who purchased pearls as presents for wives and daughters and others in the middle of the last decade may be congratulated on having made an excellent investment, because a stone then costing, \$1,000 (£200) would now find an easy sale at \$1,700 (£340) to 1,800 (£360)."—*Rangoon Times*.

Hints for Business Men.

A minute's demonstration is worth hours of explanation.

An egotist is a man who does not know himself.

Neatness mostly means carefulness, and most employers like a careful man.

To err is human; but this fact does not excuse persistent blundering.

All the unemployed want wages. Some of them want work.

War taxes the victor as well as the vanquished, as much in a commercial as in a military sense.

A supplementary estimate covers a multitude of sins, and should, therefore, be minutely criticised.

There are many ways of doing most things, but there is only one that is the right way.

The big head is the worst disease that ever attacked a young man.

A man who cannot mind his own business is not to be trusted with the king's.

From a purely business point of view it pays to care more for a customer's interests than for your own. The further removed a man is from the hog the more goods he will sell.

Essays on Indian Art, Industry and Education. By E. B. Havell, Re. 1-4. To Subscribers, Re. 1.

G. A. Natesan & Co., Sankurama Chetty Street, Madras.

Madras Dyeing Industry.

The Government in passing orders on the report of Dr. Marsden, Tinctorial Expert, Madras, regarding the state of the Dyeing Industry in Southern India have issued the following order —

Dr. Marsden's interesting report contains convincing evidence of the extent to which the Dyeing Industry of Southern India stands in need of expert technical assistance. As to the form which such assistance should take, the Government agree with the Director of Public Instruction and Mr. Chatterton that Madura should be Dr. Marsden's headquarters and that he should, in the first instance, confine himself to detailed study of the existing methods of dyeing with a view to practical demonstration of minor improvements in the Industrial processes now in vogue and the gradual establishment of such relations with the local dyers as will pave the way to regular instructional courses in the event of its being decided later on to establish a permanent tinctorial laboratory. For this purpose a sum of Rs. 5,000 will be placed at Dr. Marsden's disposal for expenditure in the manner recommended by the Director of Public Instruction. The rent of the premises which it will be necessary to hire should be met from this allotment and formal application should be submitted, where requisite, for the purchase of such apparatus, etc., as may be needed. A forecast of the probable expenditure during 1912-13 should also be prepared and Dr. Marsden should be instructed to submit brief quarterly reports of the work which he is carrying on in order that Government may be kept informed of the progress made and the developments likely to become practicable.

The Manufacture of Oxygen.

Indian Industries and Power for May contains an interesting account of the manufacture of oxygen at the new works of the Linde British Refrigeration Co., Ltd., at 138, Balliaghutta Road, Calcutta. The use of oxygen in India has been almost prohibited by the high prices charged for imported gas. On this account the quantity used by the medical profession has been restricted and the price has wholly prohibited its industrial use for welding, metal cutting, etc. The Linde Company are now selling at home prices and quote as low as 9 pies per cubic foot to industrial users.

The main engine-room is 8ft. long by 60ft. wide, and is built to accommodate a second unit of the same capacity as the first installation. The cylinder annealing, lifting, store rooms and office are attached to the front and side of the building, the whole being arranged so that full and empty cylinders may be conveniently handled from the loading platform. The driving power is a 2 cylinder Diesel engine from the extension shaft, of which a four stage air compressor is driven, as are also a Linde ammonia compressor, an oxygen and a coal gas compressor, dynamo, water pumps, etc. The overflow water from the Diesel engine, the air compressor, etc., is passed over a re-cooler and returned to the main supply tank. After passing through line purifiers, atmospheric air enters the first stage of the air compressor and is delivered through water cooled coils before entering the second stage. Similarly the compressed air passes through the second, third, and final stages, being cooled between each stage. When the compressor is first started the final pressure is 2,000 lbs. per square inch, but after liquefaction takes place, the normal working pressure during the actual separation of the oxygen and nitrogen falls to about 720 lbs. per square inch. In addition to the cooling after each stage

The Swadeshi Movement.—A Symposium by Representative Indians and Anglo-Indians No 1. To Subscribers of the "Indian Review," As 12

G. A. Natessoo & Co., Sunkurama Chetty Street, Madras.

of compression all the compressor cylinders are water jacketed so that the heat of compression is well taken up.

The high pressure air is then delivered through a series of drying bottles filled with calcium chloride and, thoroughly dried, enters the fore cooler to be cooled by means of evaporating ammonia. From the fore-cooler the high pressure air, very much reduced in temperature, is passed through pipes in the separator to be further cooled by ascending waste nitrogen and distilled oxygen, and is eventually liquefied. Liquefying, it falls into a receiver, where the nitrogen is allowed to evaporate, and on its way to the atmosphere gives up its cold to the on-coming compressed air, so helping to liquefy it. The liquid oxygen evaporates, and on its way to be stored in the gas holder also gives up its cold to the on-coming air. As liquefaction takes place and the interchange of heat and cold continues the process becomes automatic when normal conditions are obtained and the working proceeds with a steady, final delivery pressure of about 700 lb. per square inch.

Summary of Indian Trade.

The year 1911-12 has on the whole been a good one. In India the imports of merchandise rose from £86·24 to £92·42 millions, while exports rose from £140·04 to £151·76 millions and the total trade from £226·28 to £244·18 millions. These last figures show a net increase of £17·90 millions or 7·8 per cent. In rate of progression India, therefore, compares well with any of the principal countries, but in the amount of her increase she falls short of most of those enumerated.

India's grand total of Exports and Imports stated in Indian currency was Rs. 430·06 crores as against Rs. 386·25 crores in 1910-11, the increase being one of Rs. 43·82 crores or 11·34 per cent.

AGRICULTURAL SECTION.

Strawberries.

Laudable efforts to promote the growing of strawberries by the cultivators of the district continue to be made by Mr. Davies, Superintendent of the Government Horticultural Gardens at Lucknow. In his last annual report, Mr. Davies states that during the year the cultivators were persuaded once more to devote attention to this delicious fruit, and 33,000 plants were supplied to them from the Gardens at a nominal charge. Many thousands of plants could not be disposed of, however, owing to the unwillingness of the men to give any more of their land to the crop. Still, real progress has been made, and it is affirmed that, with renewed assistance from the Gardens, strawberry growing should be re-established on a firm footing.

Madras Sugarcane Crop.

The Madras Board of Revenue has issued the following outturn report of the Sugarcane Crop of 1911-12:—The total area planted with sugarcane in ryotwari villages up to the end of December 1911, was 57,200 acres or 26 per cent. more than the area planted in the corresponding period of 1910. It was also more than the averages of five and ten years by 22 and 15 per cent. respectively. The increase, as compared with 1910, was marked in the districts of Bellary and Trichinopoly and was due partly to timely rains and partly to high prices. The standing crop is reported to be either fair or good, and is estimated to yield 82 per cent. of the normal. The harvest has not yet begun in some taluqs and in the remaining taluqs harvests were made in November or December reported to be the normal period in those taluqs. The probable outturn of manufactured jaggery will be about 105,534 tons.

Canning Mangoes in India

Mr W. H Michael, United States Consul-General, Calcutta, writes in a recent report :

A few years ago a young Hindu named A. B. Sircar conceived the idea of canning mangoes in India. After giving the matter considerable thought he went to the United States to learn the art of canning peaches and other fruits grown in California, and also the trade of tinner, or at least enough of the trade to be able to manufacture tin cans and to solder the cans in the best manner when filled with fruit. He spent several years in different canneries in California and also obtained degrees in chemistry and bacteriology. He returned to Calcutta and secured sufficient financial backing to establish a plant at Muzaffarpur, which is about 350 miles from Calcutta on the East Indian Railway. About Rs 75,000 has been expended on the plant and all the machinery was purchased in the United States. Although just starting in the business, 20,000 cans of mangoes and pineapples were shipped to Europe in 1910, mostly to London, in 1911 shipments aggregated 18,000 cans of mangoes and 12,000 cans of lichees to Europe. At the branch here a case of 24 2½ pound cans sells for Rs. 42, and it costs Rs. 10 freight to land a case in London. The company also sells lichees put up in 1½-pound tins.

The process of canning the mango is precisely the same as that employed in canning freestone peaches in California. The mangoes are carefully pared and the stones taken out. Overripe, bruised or otherwise unfit fruits are rejected. The mangoes thus stripped of their peel and stones are put in cans, which are then weighed and filled with syrup. Then the cap is soldered on to the opening of the can with a cupping steel, leaving a vent hole in the middle of the can for driving out the air inside. Steam from a boiler is passed into water in a large wooden vat and the cans are placed in the boiling water in crates suspended from a crane. This is called exhausting. After

the air has been driven out the vent hole is soldered up and the cans are put in boiling water. *This operation is called processing.* After a certain time the cans are taken out and placed in the cooling vat. Some of the cans are put in an incubator and the fruit examined with a microscope to see whether it is free from bacteria. Last year the canning plant employed more than 80 persons per day. The common labourers receive 5 to 8 annas a day, and those who peel the fruits are paid by the hundred. It is said that the employees show wonderful adaptability to the work, and at the end of the season were able to do three times as much work as at the beginning. Even persons belonging to high caste families took an interest, and some of them became employees in the cannery. It is believed that plenty of intelligent labour can be obtained.

Sugar from the Palm Tree

A recent United States consular report deals in great detail with a probable development of the sugar industry of the Philippines in the form of extraction from the nipa, a palm tree well-known in every tropical country. The official investigation into the alcohol industry of the Philippines appeared to show that sugar can be manufactured more economically from the nipa than from sugar cane, and this led to researches spreading over two years, the results of which are now published. The nipa palm especially attracted attention not only because of its manifold uses as a plant, but because it grows wild under conditions which render it easy of access and in land which is largely useless for other purposes.

Indian Agriculture

That quarterly publication, the *Agricultural Journal of India*, contains in its January issue a series of interesting economical subjects, handled, as a rule by experts in their respective spheres. There are no fewer than three contributions on sugarcane, Insect pests, Cotton cultivation in the Western Districts of the United Provinces and other subjects are ably touched upon.

THE HON. MR. P. S. SIVASWAMI AIYER, C. I. E.
The Indian Member of the Executive Council, Madras

Departmental Reviews and Notes.

LITERARY.

THE STUDENTS' BROTHERHOOD MOTIWALA PRIZE."

The managing Committee of the Students' Brotherhood are offering a prize of the value of Rs. 125 to all under-graduates and graduates of not more than five years standing for the best essay not exceeding 5000 words on "The present system of Education in India, and its bearing on the social and Religious Life of the People." The Essay to be submitted to the undersigned with a non de-plume and the name of the writer to be sent in a closed envelope by 31st October 1912 to B. S. Turkhud, Honorary Secretary Post No. 4, Girgaon, Bombay.

THE ROMANCE OF THE TWISTED SPEAR.

Her Majesty the Queen has been graciously pleased to accept a copy of "The Romance of the Twisted Spear" from Mr. Herbert Sherring, the author, and Vice-Principal of the Mayo College, Ajmer, India.

MR. HAROLD COX.

The appointment of Mr. Harold Cox to the Editorship of the *Edinburgh Review* is interesting to us in this country, for Mr. Cox, once a Professor at the M. A. O. College, Aligarh, and recently a visitor to India for the Durbar, has often rendered direct and indirect services to this country. An able journalist, with a judicial mind so long as one or two of his cherished theories are not touched, Mr. Cox should do well in his new position. It remains to be seen whether he will revive the *Edinburgh Review's* influence as an organ of literary criticism.

A NEW BOOK ON EASTERN ASIA.

Mr Lancelot Lawton's long announced study of the chief countries and political problems of Eastern Asia is now in the press and will be published this season, in two volumes, by Messrs. Grant Richards.

SHOULD THE LITERARY MAN MARRY.

A writer in *T.P.'s Weekly* discusses the question "Should the Literary Man Marry"? and illustrates his position with the following remarks:—

Balzac says that the author should have neither wife nor children, that he should in common honesty to others tread his path alone. Spielhagen, the great German novelist Flaubert, Byron, Walter Savage Landor, and others reinforce this opinion. Yet if there is a man in the world needs the love and sympathy of a wife it is the literary man. But in literature's annals the fact stands forth that, of all men, authors have been the least happy in their domestic lives. Shakespeare, from his own bitter experience, announced that a young man married is a man that's married. Milton sang of "Paradise Lost" and he experienced it with three successive wives. Addison escaped from his Countess to Will's Coffee-house and the geniality of Steele and fellow writers.

There have been wives who were to their author husbands both their comfort and their stay, Lamartine, and John Stuart Mill had life partners who were perfectly congenial, Beaconsfield, in his dedication in "Sibyl" terms his "a perfect wife," Dr. Johnstone's "Letty" made him very happy, and he never ceased to miss her and mourn her death. Guizot and his wife were as twin-souls, and so were that incomparable pair, Robert Browning and his helpmate Wordsworth's wife was a "phantom of delight" to him, while Shelley's second venture proved a fortunate choice, the strongest bond of sympathy and affection existing between the married pair. If the literary man will marry, his wife—to get down to the bones of the matter—should be either a plainminded woman who can occupy herself exclusively with household matters and shield her husband's peace by taking on herself more than the darning of his socks, or else a woman capable of entering unaggressively into his literary life.—"T.P.'s Weekly."

LEGAL.

JUSTICE IN INDIA.

The following letter, signed "Judex" appears in the *Times* in reference to an article in that paper on the "Administration of Justice in India"—

Permit me as one who has spent the best part of a life time in Indian Courts of every grade to endorse your article on the administration of criminal justice. The administration is deplorably weak, not only in difficult cases of conspiracy, but in the matter of ordinary crimes. Most districts of the province I served in could produce cases of repeated acquittals of undoubted criminals. A strong commission examining these records and judging from their cumulative effect would undoubtedly come to the conclusion that serious failures of justice had occurred, and would be able to lay its finger on the cause. Such a commission is urgently needed. I recall to mind the case of a hired assassin convicted by the Court Session and acquitted on appeal by the High Court. The witnesses were apparently genuine, and had witnessed the murder, but in their anxiety to procure a conviction they stated that the persons who had hired the assassin were also present at the murder, though in fact they were not. The High Court therefore had to choose between an acquittal of the assassin, or his conviction on the evidence of witnesses who clearly had no respect for the obligations of an oath. According to private statements by the police this was the assassin's seventeenth murder. Supposing this to be correct, what is there to prevent this man from committing seventeen more murders, if sufficiently paid for his work? Certainly nothing in the criminal law as administered at present. But supposing that this man's life history were gone into after the French manner, would there not be ample evidence to satisfy any person of ordinary intelligence that

he was a danger to the community? Why should English methods alone be the best for India?

The English law of evidence is entirely based on the idea that a jury is only fit to hear a portion of the truth, and not the whole. Why should this law be the best for India? Was it introduced because it was the best for India, or merely because it was English? There are criminals, dangerous and sometimes habitual, often wealthy and of some position and influence. Every one high and low, rich and poor, even the children in the gutter, know them to be criminals. Every one knows this, except the Government of the country, which seems to have blinded its eyes and tied its hands with red tape. The wealthy and powerful criminal has only to sit behind the most flimsy of curtains—the Government can never see through it and the criminal knows it.

In a country like India, where the only evidence obtainable is liable to be tainted, no means of arriving at the truth should be excluded; an experienced tribunal should have the power to examine into the life history of an alleged criminal as a whole. The Government allows itself to be beaten in detail instead of bringing all its forces into action at once.

The Government of India cannot bear the sword in vain.

THE SHOPS ACT IN FORCE.

The Shops Act 1912, came into force on the 1st instant. The Act provides that all shops should allow a weekly half-holiday for the servants. It insists that sufficient time for rest and dinner during the day should be given to the workmen. Among the shops which are not required to close for a weekly half-holiday are those, in which intoxicating liquors, refreshments, motor, cycle and air-craft supplies, newspapers and periodicals, food of a perishable nature and medicines are sold.

MEDICAL.

FITTING NEW NOSES.

From America comes an account of a wonderful operation recently performed in order to provide a patient with a new nose. A small piece of bone was taken from the bone of a leg which had just been amputated and the bone was then carved into the semblance of a nose with nostrils complete and was placed under the non hairy part of the skin of the arm of the patient. The bone lived, became attached to the skin which was stretched out over its surface, and after a few months the bone and its attached covering of skin were removed from the arm in one piece. This was then transplanted to the face stretched in position and after a little while became a good firm bony nose covered with smooth healthy skin.

THE FIRST INDIAN LADY M. B. AND C. M.

Miss C. N. Muthulakshmi Ammal who has passed the recent final M. B. and C. M. of the Madras University is a native of Pudukotah. She passed the first, second, third and the final M. B. successively with credit, secured honours' certificates in certain subjects and also Sibthorpe's prize in surgery. Out of about 50 students, that started with her in the M. B. and C. M. course in 1907 only 6 survived for the final examination of whom only 3 passed, Muthulakshmi being the first of them. She has secured three gold medals, the Bharatha Latchmi, Sir Ramaswamy, and Lady Grant Duff. It would appear she is to take charge of the *Ladies' Hospitals* at Pudukotah.

ANCIENT HINDU MEDICINE.

Recently in the Usher Institute of Public Health, Edinburgh, a lecture was given on this subject by Dr. John D. Courrie, M.A., B.Sc., M.D., F.R.C.P.E., under the auspices of that Indian Guild of Science and Technology. The lecturer first dealt with the ancient Aryan medicine which is contained in the Vedas or sacred writings of

the Hindus, and believed by them to be of divine origin. He pointed out that in the Vedic period, say, about 1200 B. C., medical practices were of a simple nature, and great reliance was placed upon prayers and other theurgic means; but this Vedic medicine was much more highly developed than that of other primitive peoples. The medicine of the Brahmanic period up to the Arab conquest about 1000 A. D., was next considered. One of its most striking features was the skill with which simple, and in some cases, serious surgical operations were performed from the time of Susruta, who lived in the fifth century B. C. From his writings, through the Arabs, Western surgeons learned two thousand years later how to fashion a new nose from the cheek when that organ had been cut off as a punishment or destroyed by disease. Indian physicians gathered and tried new plants and drugs with unwearied assiduity, so that the great majority of our most valuable and commonly used drugs came originally from India, their properties having been discovered by these Hindu physicians. At various periods the medicine of India had come in contact with that of the West, Alexander the Great, in his Indian expedition of 327 B. C., was accompanied by a retinue of learned men and physicians, who took back with them to Greece, many new animals and plants. Again, after the Mahomedan conquest of India, the mediæval medicine of Europe was grafted by the Arabs upon Indian medicine, which thereafter remained stereotyped till a renovating influence came from the introduction by British rule of hospitals and medical schools.—*Sootman*

STUDIES IN THE MEDICINE OF ANCIENT INDIA, Part I Osteology, or The Bones of the Human Body By A. P. Rudolf Hoernle, C. I. E. Rs. 6-9.

SCIENCE.

COLOUR PHOTOGRAPHY.

A new method of colour photography demonstrated before the Royal Photographic Society recently, has the peculiarity that no special colour-plates are necessary, nor is there any introduction of artificial colour screens or coloured particles. A plain negative, as in ordinary photography, is taken, an ordinary positive or lantern-slide is made from it and by purely optical means, using a grating and prism, a picture in natural colours is faithfully reproduced. The process is the work of two brothers, Ernest and Julius Rheinberg, and is called the micro-spectra method of colour photography by prismatic dispersion. The method, which necessitates a special and costly camera, and therefore is put forward for its scientific interest and not commercially, depends on the use of a grating or line screen, which is employed at the making of the negative and afterwards is placed behind the positive that is made from the negative, when it causes the black and white picture to appear in the exact colours of nature. Examples of the results obtained were projected on an aluminium screen, and were declared to be unsurpassed in fidelity of colour-rendering by any method in vogue at present.

NOVEL ELECTRIC ALARM FOR CLOCKS.

The method of putting an electric contact upon the dial of an alarm clock in order to ring a bell when the hands come to the right point is well known, as is also the method of wrapping a cord about the winding key so as to have it pull a switch. However, all these cases imply modifying the clock in one way or another. What is desired is not to make any change whatever upon the clock, and this is realized in a vibration method used by a French inventor. All that is needed is to put the clock on a shelf or the cover of a box, the shelf having a main flat part for the clock,

and in front a sloping part or slideway. On the slideway a metal bar is laid and below it are two contacts such as screws or nails, so that when the alarm goes off the vibration of the shelf will cause the bar to slide down and make the contact. An alternative scheme is to pivot the bar at one end, with a contact stud lying below the other end. In this case one wire is connected to the bar and the other to the stud, so that the bar swings down and makes the contact.

The battery and electric bell can be placed inside the box, and the top is used for the shelf. An electric lamp above the clock completes the outfit.—*Times of India*.

SELF-ADVERTISING ANIMALS.

Some animals walk delicately, some lie low, some fade into their surroundings, some put on disguise. On another tack, however, are those that are noisy and fussy, conspicuous and bold,—the self-advertisers. The theory is that those in the second set can afford to call attention to themselves, being unpalatable or in some other way safe. The common shrew, for instance, is fearless and careless, and makes a frequent squeaking as it hunts. It can afford to be a self-advertising animal, because of its strong musky scent, which makes it unpalatable. A cat will never eat a shrew. Similarly, the large Indian muck-shrew is conspicuous, even at dusk, fearless in its habits, and goes about making a peculiar noise like the jingling of money. But it is safe in its unpleasant musky odour. The common hedgehog is comparatively easy to see at night; it is easy to catch, because it stops to roll itself up; it rustles among the herbage, and "sniffs furiously" as it goes; it is at no pains to keep quiet. Nor need it, for although some enemies sometimes eat it, it is usually very safe, partly in its spines, and partly because it can give rise to a most horrible stench. The porcupine is another good instance of a self advertiser, and so is the crab-eating mungoose.—Professor J. A. THOMSON, in *Knowledge*.

PERSONAL.

EDINBURGH AND LORD PENTLAND.

Lord Pentland was presented with the freedom of the city of Edinburgh in recognition of his services as Secretary for Scotland for seven years and of his appointment as Governor of Madras.

In acknowledging the honour, Lord Pentland said that he was born in Edinburgh and it was a source of pride to him that at a very early age he took part in public affairs. His parents were well known in Edinburgh. His father's parents were buried in Holyrood, and only the other day, among papers of his family he was shown a burgess ticket of his great great grandfather granted to him by the old Burgh of Canongate in 1772. The Lord Provost had referred to his work as Secretary for Scotland. With the exception of the office of Prime Minister, which might be said to include and comprehend that of all his colleagues there was in his judgment no office which a true Scot should be more proud of holding than that of the Secretary for Scotland, Minister responsible for the good government of his own country.

Every country seemed to have its problems to work out. In Scotland they held tenaciously to their claim to share in the wider concerns in Empire. They should not forego the full share in that partnership. At the same time they had to think of their own country and as year by year many of their own countrymen left their shores to seek wider fields of work and enterprise, it sometimes seemed to him that their problem was how to develop their own country in view of the greater attractions which existed elsewhere. His belief was if that ever Scotland was to be more fully developed than she was at present, it must be through her local authorities who should have complete freedom in their own sphere to do their work in accordance with their ideas and with the conditions which they found existing.

LABOUCHERIANA.

Mr. G. W. E. Russell contributes to *Cornhill* several characteristic reminiscences of the late Mr. Labouchere:—

He was the oracle of an initiated circle, and the smoking room of the House of Commons was his shrine. There, poised in an American rocking-chair and delicately toying with a cigarette, he unlocked the varied treasures of his well stored memory, and threw over the changing scenes of life the mild light of his genial philosophy. It was a chequered experience that made him what he was.

He delighted to call himself "the Christian Member for Northampton," in contrast to his colleague, Mr. Bradlaugh.

Of his exclusion from Liberal Cabinet in 1892, Mr. Russell says, speaking of Mr. Gladstone:—

He became Prime Minister for the fourth time, and formed his last Cabinet. But he did not find a place in it for Labouchere. Before he submitted his list to the Queen, he had received a direct intimation that he had better not include in it the name of the editor of *Truth*. On this point Her Majesty was reported to be "very stiff." Whether that stiffness encountered any corresponding or conflicting stiffness in the Prime Minister I do not know, but for my own part I believe that "the Grand Old Man" acquiesced in the exclusion of "Henry" without a sigh or struggle.

Mr. Russell quotes a letter of the end of 1906, in which Labouchere wrote:—

As for the Education Bill, I do not love Bishops, but I hate far more the Noncon. Popes. Either you must have pure Secularism in public schools, or teach religion of some sort; and, altho' I personally am an Agnostic, I don't see how Xtianity is to be taught free from all dogma, and entirely creedless, by teachers who do not believe in it. This is the play of "Hamlet" without Hamlet, and acted by persons of his philosophic doubt.

GENERAL

BRITISH CITIZENSHIP

One is so familiar with the phrase *Civis Romanus* that one is apt to assume that there is a modern equivalent to it in the British Empire. How far this is really the case is being discussed in a valuable series of articles in *United Empire*. The Chief Justice of Australia says that "British Citizen" is a misleading term, because it suggests a status and privilege of a definite kind as in Rome. He suggests the term "national" for the purpose of avoiding confusion, since it has none of the subsidiary attributes which have come to be suggested by the terms "British subject" or "British citizen." A national may claim protection against foreign Powers, but is not entitled to political rights or privileges and may be denied right of entry into any part of the British Empire. Another writer, Mr Edward Jenks, argues that "citizenship" implies subjection to, and enjoyment of, a common system of law, and in the later Roman Empire such a status did exist, so far as private rights and duties were concerned, for all the free subjects of that Empire. Hence the well known title, *civis Romanus*. He goes on to say that before such a phrase as "British citizen" can acquire a corresponding meaning, a great centralising change, amounting almost to a revolution, will have to occur; and this change may prove to be wholly alien to the tendency of British development.

INDIAN PROFESSORS IN AMERICA.

An editorial note in the *Modern Review* for May says:—

Mr. Har Dayal has been appointed Professor of Indian Philosophy and Sanskrit at Stanford University, Palo Alto, California. *The Daily Palo Alto*, the organ of that University, writes in its issue of 1st March last:—

Har Dayal, the Hindu student, has been appointed by the Board of Trustees as lecturer on

Indian Philosophy at Stanford University, and he will meet with his classes next week. The courses will be in the regular curriculum and credit for graduation will be given for this semester's work.

A course in Sanskrit is to be given by Dayal and he is also to give descriptive and historical lectures on the Philosophies of India. All interested in taking either of the courses are requested to meet in room 460 on Tuesday, March, 5, at 2 30 p.m. Mr. Dayal will be present to meet the students. It has not yet been decided whether they will be two or three hour courses.

The engagement by the trustees of Mr. Dayal is an innovation in American college circles, as no other Hindu lecturer is known to be engaged in the institutions of the United States. The students who take the new courses will doubtless receive much benefit by receiving their knowledge of the subject practically first hand.

Mr. Har Dayal is a brilliant graduate of the Punjab University and studied for sometime at Oxford. He was asked to deliver two lectures on Indian philosophy in January last, and the appointment has followed after a short time.

Stanford University is one of the fourteen great American Universities. It was founded by a millionaire with an endowment of several million dollars. It is the richest university in the world as regards endowment. But there are no opportunities for self support there, and the University charges fees. If Indian students wish to go there they must have means of their own; and they must be graduates of some Indian University. This University is noted for the excellence of its departments of science, engineering and medicine. It does not attach so much importance to mere literary studies. But the above three subjects are taught very efficiently. The professors are men of world wide reputation.

ROBERT BROWNING

[Robert Browning was born in 1812 three years after Tennyson, and died in 1889 three years before him. It is thus exactly a hundred years since this prodigy of Modern age came into the world.]

gratitude for deliverance, their own nothingness and Christ's infinite merit. We wonder at the burning intensity of their words, which seem to come at a white heat from their inmost soul: they are clearly the strongest, deepest fact of their experience and form the motive power which drives them forth to spend their lives for others. I was asked once by a Hindu in England what was the amazing power which sent men forth joyfully to death in Central Africa or the cannibal islands of the Pacific,—men like Hannington and Patterson,—and I pointed at once to this. He seemed surprised, and asked me how the sense of sin and its forgiveness could ever accomplish such miracles as these. Yet the more we study such Christian lives, whether ancient, mediæval or modern, the more we find that it is this very consciousness of sin and of the unutterable love of God's forgiveness, that impels men, not in tiny numbers, but literally in thousands, to face death itself among the poor and degraded and depressed. This is surely a phenomenon which Hindu India, with its problem of the depressed classes, would do well to study.

Again if we look, not at Christian individuals, but at nations, the same phenomenon appears. We find that where conviction of sin was strongest and repentance for sin deepest, there more than elsewhere the moral upward movement of society was made possible. We see for instance how in the decay of the Roman Empire, civilization in the West was saved from utter overthrow by great inner movements towards a holier life. We see Europe again, in the Thirteenth century, uplifted as a whole by the Franciscan Movement with its deepened consciousness of sin and its forgiveness. Luther and the Reformation are in one sense almost synonymous. The strength of Luther compared with the weakness of Erasmus was in the depth of his conviction of sin. He preached not culture, but conversion. In the Eighteenth century in England, when morality was sinking to its lowest ebb and national life was declining, it was not the moral platitudes of Addison or the cold intellectual arguments of the philosophers which changed the nation, but the burning words of Wesley and White-

field, men who had felt the awfulness of sin in the depths of their own hearts and knew the Joy of its divine forgiveness. 'Not till the Wesleyan movement had run its course' says Green in a famous passage in his history, 'did the philanthropic movement begin.'

More than all other things in India to-day, we need some mighty, quickening spiritual impulse, which will stir to the very depths the hearts of men and raise them above the increasing materialism of the modern age. It will not be sufficient to take the Christian message, the doctrines of the Fatherhood of God and the Brotherhood of Man divorced from their context. Only as they are related to the Christian faith in the Atonement will they gain moving spiritual power.

The Christian doctrine of the Atonement is not an easy doctrine for men to learn who are unwilling to trace evil to its root in themselves. It cannot be understood by the self-satisfied and the self-righteous. It needs a humble and a contrite heart. But to-day, in India and elsewhere, the Holy Spirit of God is moving in the hearts of men and of nations, humbling them, and awakening them, by the very magnitude of their own needs, to the meaning of sin in the world. There is no subject more full of hope and encouragement than to trace out the movements of that Spirit in modern history. Just as the new green grass covers the barren plains when the rains at last break in refreshing showers upon it, so from the foundations of society upwards new moral life is springing forth in some of the most backward regions of the world before our very eyes. The most wonderful example, though by no means the only one, is that of Uganda. There thirty years ago were cruelty and savagery unimaginable. To-day there is seen, in that same African people, a nation new-born, slavery abolished, cruelty abandoned,—the fair flowers of a Christian life springing both from the conviction of sin and the joy of its forgiveness.

I have already said that the Christian doctrine is not easy to grasp except by a heart that feels its own supreme need. In attempting to explain it, I am assuming that this need is

felt. Perhaps the simplest approach is to appeal to human experience. Here we see at once that no forgiveness can be without cost or suffering to the one who forgives. The mother forgives her child, but the child's sin means anguish to the mother. The friend forgives the treachery of his friend. But that treachery leaves its mark in suffering. The greater the love, the closer the relation to the sinner, the deeper will be the wound inflicted. The purer and holier the nature of the one who forgives, the keener will be the anguish at the contact with sin. There is no question here of quantitative suffering, or exact measurement, or legal equivalent. But there is, all the same, the clear and ultimate fact that *no forgiveness can be without suffering*.

Now this is what the Christian doctrine of the Atonement teaches about God. It tells us that the sin of His children is not a matter of indifference to Him. It tells us that He is not a far-off distant God in a distant heaven, careless of mankind, but that He is so near to us and loves us so deeply, that every moral wrong is a sin against His Holiness, an outrage to His Goodness, a cause of suffering to His pure and loving Nature.

It tells us that he who loves us suffers for our sin, and that His suffering is the measure of our sin. If it is true in the human relation that the one nearest and dearest to the sinner bears with greatest anguish the sinner's fall; if it is the father or the mother who suffers most for the sin and disgrace of the child: then it is infinitely more true (so the Atonement teaches us) that God Himself, who loves us unutterably, more dearly than any earthly parent, suffers for our sins.

But there is something further than suffering in the Atonement. The suffering is willing, voluntary, personal, that is to say, the suffering is *sacrifice*. No involuntary suffering could move the sinner to repentance. Nothing but the infinite *sacrifice* of God could appeal to the heart with such commanding power as to redeem man from sin. When I was working in the slums of the most degraded part of London, I used to see daily a pure and devoted

English lady, born in a high estate who for love's sake and for love's sake only used to sacrifice daily all that was most dear to her, in order to go down into the very haunts of sin and vice to rescue the outcast and the fallen. Her power was beyond words. Men and women almost worshipped her. She was able to raise them from the death of sin to the life of righteousness. This is but a weak parable of the love of God revealed in Christ. God Himself, so the Christians believe, became very man in Christ,—bone of our bone, flesh of our flesh. He, the Pure and Holy One, came into the very heart of our sin and shame. We rejected Him, we spat upon Him, we crucified Him, but He bore it all for pure love's sake. His very life was poured out for love of us in sacrifice.

We seem to learn three lessons which form the three parts of the one Sacrifice of God. First, that the Divine Purity shrinks back with unutterable shrinking from contact with human sin. Secondly, that the Divine Love is so infinite as to overpass that awful barrier of moral evil in order to come close to us, to embrace us, to redeem us. Thirdly, that the contact of Divine Purity and Love with human sin involves suffering and sacrifice even in God Himself. The life and death of Christ, who is God Incarnate, is thus the measure and the symbol, in time, of the eternal sacrifice which flows from the Divine Love.

It is through the realization of these mysterious truths about the Love of God, that Christians come to the knowledge and joy of their forgiveness. Let me try and express, however inadequately, what that Christian experience is. At first, it may be, we have little awe of God's Holiness and only a feeble sense of our own sinfulness. But as we grow older there comes some inward revelation in our conscience, which cannot be set at rest. The Holy Spirit of God moves within us, convicting us of sin and guilt and the voice within us cannot be set at rest. We find ourselves the slave of some evil habit, or some evil thought, or some past stain upon the soul, which cannot be blotted out, and we cry with St. Paul:—'O wretched man that I am,'

shall deliver me from the body of this death? At first under the sense of the awfulness of sin, there comes a great shock and cleavage in our lives. We feel, perhaps for the first time, our infinite moral distance from God. The burden of this feeling becomes more and more intolerable as the Holy Spirit moves within us, convicting us of sin. We stand afar off, like the publican in the parable, and cry 'God be merciful to me a sinner.'

It is at this time of spiritual struggle and sincere repentance that the Christian message of God's sacrifice of love comes to us like the dew upon the thirsty ground. We can see the overwhelming glory of it. The words 'God is Love' are lighted up with a new meaning. The Fatherhood of God becomes a reality. We say with the poet:—

"Would I suffer for him that I love? So would'st thou,
so wilt Thou.
He shall crown Thee the topmost, ineffablest, uttermost
crown,
And Thy love fill infinitude wholly, nor leave up nor
down,
One spot for the creature to stand in! It is by no breath,
Turn of eye, wave of hand, that salvation joins issue
with death!
As Thy love is discovered almighty, almighty be proved
Thy power which exists with and for it of being beloved.
He who did most shall bear most! The strongest shall
stand the most weak
'Tis the weakness in strength that I cry for! My flesh
that I seek
In the Godhead! I seek and I find it! O Saul it shall be
A Face like my face that receives thee, a Man like to me
Thou shalt love and be loved by for ever! A Hand like
this hand
Shall throw open the gates of new life to thee! See the
Christ stand!"

When we find such Love revealed in Sacrifice as this, meeting us at the very point of our own sin, where all seemed hopeless and our need was greatest, then our whole heart goes out to God, and Love answers to Love, and Sacrifice answers to Sacrifice. Instead of the thought of death and judgment being a terror to us, instead of our own sins over-whelming us, we now rejoice in the sunshine of God's Presence. Forgiven much, we love much, and our lives become daily filled with acts of sacrifice, with attempts, however feeble, to give up ourselves in the service of others. We lead a new life, not of slavish bondage, but of loving

service. We are not our own; we are bought with a price,—the price of God's infinite Love.

What I have tried to write can only be known by personal experience. The words seem to grow cold as they are written in ink, and are set down to be read in a magazine. They need to be witnessed in the lives of living men and women to be understood. But even thus feebly expressed, they may give to thoughtful Indians, who see their own need and the needs of their country, some glimpse of the potentiality of this Christian doctrine of the Atonement, which, when believed with heart and soul, has power to change the lives of men and send them forth to spend and be spent in unselfish service.

PUBLIC LIBRARIES FOR PUBLIC EDUCATION

BY

MR. B. M. DADACHANJI, B. A.

WHILE Europe and America are making rapid progress in all directions, rising higher and higher every year, India is lagging far behind. With her glorious past, which after the lapse of nearly thirty centuries still challenges the admiration of the world, with a people endowed with good qualities of the head, India is a country fitted to take her intellectual place with other civilized nations, if proper steps in the right direction are taken. She has already shaken off her lethargy of centuries, and her manifold activities lying dormant for ages and threatened with extinction hold out the promise of being revived and quickened under the elevating influence of Western civilization combined with the opportunity offered by the *Pax Britannica*.

The future of India depends to a very great extent on the status to which the masses can be raised. Their present degraded condition is solely due to ignorance. No country can ever hope to attain greatness, mental, moral or material, if it can boast of only a small percentage of its population being tolerably or even highly educated, while the masses

are left to grovel in darkness and ignorance or merely taught to read and write.

The question of free compulsory primary education as one of the essential means for the uplift of the masses has long been before the Government and Indian leaders. The Hon. Mr. Gokhale's Bill has done more than anything else to focus on it the attention of the whole country. Important as the question of the diffusion of elementary education is, Indian educationists do not seem to have realised the equal importance of free public libraries as an educational factor. It has yet to be recognized that no scheme of school education, however costly or elaborate, can ever succeed without an extensive co-working scheme of public libraries. That is one of the chief reasons why the large number of persons already turned out by the schools and colleges during the last 60 years have given such a poor account of themselves, in spite of the great help and impetus given by the British Government and it is safe to premise that the rate of India's progress will not be as great as could be desired, by the mere multiplication of schools and colleges so long as proper attention is not paid to the question of libraries.

In the evolution of societies herds of men have been succeeded by mobs of men and in the evolution of the mob the reading mob has replaced the shouting mob. To bring about such a result is an easy task compared with that of organising the reading mob into societies of thoughtful men, mindful on the one hand of the best traditions of the human race and open on the other to the latest revelations of science. From this point of view then the problems of national education resolve themselves into problems of aims and methods of reading and a new significance attaches to the place of literature among instruments of culture and to the library among institutions of learning. These vital problems bring us face to face with the questions: How can the school and the public library be brought into such position that the one may supply what is lacking in the other? How can the library re-inforce the school and the school re-inforce the library?

For the solution of these problems it is necessary first of all to recognize that the public library is an integral part of public education—not an adjunct merely, but a necessary complement of it. The relation of the school to the library is that the former stands for the acquisition of the mere rudiments of knowledge in certain subjects, the latter for the amplification and rounding out of that knowledge. The atmosphere of libraries is a necessity of education taken in its most comprehensive sense. Whoever wishes to live in the present and do anything for it or for the future must be familiar with the past, and also must be familiar with what others are doing in his own, or in parallel lines. No one can do anything vital for an age unless he understands it thoroughly and no one can understand the age thoroughly unless he broadly grasps the facts that make it and have made it what it is. Such understanding, such grasp can only be obtained in the atmosphere of well equipped, well conducted libraries.

OUR ANTIQUATED IDEAS.

The average educated Indian's conception of the duties and aims of public libraries is very narrow and antiquated. Even persons who are highly educated and hold important positions cannot boast of a better conception. That explains why the question of free public libraries has not received any attention in this country while in Europe and especially in America the number of such institutions is daily increasing. What is really wanted is that the leaders at least should make a thorough study of the rich literature of the library movement in Europe and America and with the co-operation of the press try to spread among their countrymen a knowledge of the countless blessings which these institutions are conferring on the people in those countries. The more widely such knowledge is diffused the sooner will dawn that happy era when well-equipped libraries will spring up everywhere, throwing light in all the places where at present nothing but darkness prevails, educating, elevating, and refining millions of persons who are denied the opportunities to

realize their hidden self after they leave off the school or the college.

THE LIBRARY RELIGION.

Even the mere study of the library literature will infuse in the leaders a good deal of enthusiasm. But to be really successful in such matters one must needs to be drunk with enthusiasm. Whoever desires to place himself in that state should pay a visit to the best libraries of Europe and America.

Some idea of the importance of such a visit may be formed from the fact that when His Highness the Gaekwar visited the libraries of the West and studied their aims and duties, methods and activities, he became inspired with the new religion—Library Religion—which he has been preaching from his capital at Baroda. India has for centuries been the home of many great and ennobling religions but she will have to welcome this new religion for the salvation of her children.

THE MODERN LIBRARY IDEA

I shall now proceed to give a short account of the chief aims and activities of the Free Public Libraries in America where the broadening of the Library idea and the consequent ramification of the functions of the Library in many different directions has found its greatest exemplification.

The true purpose of the modern library is essentially educational. Its real object is to enable the thinking men and women to realize the possibilities of life. Its highest function is to carry culture into the organic life of society. Its mission is to make better citizens by developing in young children, boys and girls, men and women a taste and a passion for the best literature of the whole world.

Quite unlike the libraries of old, modern libraries are living and active forces. Their conception of duties is comprehensive. They look upon the whole community as their clientele. Sitting down and waiting for readers who care to go to them is what the libraries abhor. They cater as diligently for the child as for the adult, as diligently for the casual reader as for the scholar, as diligently for the artisan, mechanic, factory hand, merchant,

and farmer, as for the literary men. They not only supply books to those who want them but create a demand for their books. Their attempts are not confined to providing books that will suit the taste of every reader; they try to gradually and imperceptibly improve the taste. These libraries are havens for intellectual recreation, reference, study, and research. That the library should find a book for every reader and a reader for every book on its shelves is one of the basic principles of the American Library Administration. Continued usefulness to the public is the goal aimed at. No regulation that would lessen the amount of good that the public can get or the speed or ease with which that good may be obtained is ever tolerated. The libraries recognise that there is no such thing as finality or completeness in library economy. Though the readers pay no fees whatsoever, the libraries call them their patrons and behave towards them accordingly.

THE LIBRARY AND THE CHILD.

The recognition of the need of a special attitude towards children is the pride and the glory of the library. The age limit has been altogether abolished. The youngest children are tempted to enter the library with the help of exhibitions and picture books. A juvenile section containing specially selected books for boys and girls of all ages is provided. Separate catalogues and illustrated reading lists are prepared. Lady Assistants are entrusted with the work of ascertaining the bent of mind and intellectual needs of each child that enters the doors of the library.

If children are to benefit from books and libraries in after-life they must be familiarised with them and taught to use them intelligently. One of the most effective ways of doing so is the "Library Lesson." Library Lessons are given to classes of school children in libraries by the librarians or by the teachers. When the lessons are given by the former they are devoted to explanations of how to use the library, how to consult the catalogue, how to consult works of reference and so forth. When the teachers give the lessons, they are on the subjects that are being studied in the schools.

For this purpose the teachers draw upon the library stock of books and pictures and other illustrations of the subjects.

CHILDREN'S LECTURE.

Another important and popular branch of the library's work with children is the "children's lecture." The lectures are illustrated with magic lantern slides. They widen the range of the children's reading, broaden their sympathies and excite their imagination. Some lectures are for the older children and some for the younger. Reading lists pertaining to the subjects of the lectures are printed and distributed free of charge.

STORIES AND GAMES.

By far the most popular item in the extensive programme of this branch of the library is the "story hour." On certain days in the week the children's librarian recites to a group of the young ones selections from the best stories in the world's literature. The rapt attention and sincere admiration with which these stories are listened to is a sight for the gods. The object of the story hour is the same as that of the lectures just referred to and it is gained without seeming to force any particular book upon any one. As an aid to increasing the importance of the story hour, the moving picture apparatus is used. The story is first told and the same series of events is then presented to the eye by the moving pictures.

Of late, indoor games have been added to the long list of beneficent lures employed to catch the young children and to make them good library-users. A nation whose children are so well cared for need have no concern whatsoever about its future.

THE LIBRARY AND THE SCHOOL.

The public library establishes close relations with the schools. The schools realise that it is greatly to the advantage of the scholar and of those informal processes of training that are going on constantly during life whether he will it or not, that he should form, when at school the habit of consulting and using books out-

side of the school and consequently they heartily co-operate with each other.

Every School, of course, has its own library and every grammar class its own collection of books. But these libraries and collections are generally limited to books used directly by the pupils in the preparation of their lessons. For everything in the nature of supplementary reading the students depend on the public library.

The ways in which the public library aids the schools are innumerable. For the purpose of this article a bare mention of the most important ones will suffice. The assistants to whom the work is assigned visit the Schools in their respective districts from time to time and become personally acquainted with the teachers. They place themselves at the disposal of the teachers whom they invite to visit the library, giving such information and assistance as may be required. The functions of the library and the facilities it offers are explained before groups of teachers and at regular School assemblies. Special privileges are granted to teachers. They are also encouraged to tell the library what books they desire it to purchase for their own professional use and for their students' supplementary reading. Loans of travelling libraries are given to teachers and teachers are induced to take the library books into their lectures or recitations and introduce them to the pupils as part of the exercise. Lists of library books to be read in connection with the various courses to be given throughout the School term are prepared by the library assistants in consultation with the teachers. Teachers in the lower grades are asked, when they are found willing to do so, to take their classes to the library for instruction on some subjects with the aid of the library's resources or to see an exhibition or to be taught necessary things about the use of the library. Library information is posted in every School in the library's own bulletin boards. For students who have no conveniences at home to prepare their lessons, the library makes provision in the children's room, installing there a reference library.

FREE ACCESS TO THE SHELVES.

The most striking tendency of the modern library is in the direction of giving to readers greater freedom in its reference and lending departments. The advantages of book-using are directly proportionate to the accessibility of the volumes. Books which are kept in closed stacks are regarded as bad books. No library can justify its existence or lay claim to public support if it does not allow its readers to move freely amongst the books, to examine them, and so doing come to know, love and use them. The desire of the public to handle books is very strong and the library is anxious to gratify it fully. The open-shelf system which allows readers not only to handle the particular books they wish to examine with a view to reading, but also to browse among the shelves is now practically universal, except in large city libraries, and even these usually have a large open-shelf room containing many thousands of volumes.

The value of the open-shelf is enhanced in many large libraries by placing the services of certain assistants at the disposal of readers who repair to the open shelves and who appear in need of guidance in their selection of books. These assistants are said to be on "floor-duty."

Free access to the shelves is, no doubt, open to some serious objections. It increases the opportunities for theft and mutilation of books and leads to quick and constant disarrangement of books by the readers who are generally not careful enough to replace them properly. But the library prefers to put up with this loss rather than deprive all of its readers of this great privilege. It also makes arrangements for constant revision of the shelves. Of course the library takes reasonable precautions against these abuses but the precautions are never such as would in the least degree interfere with the readers' movements.

Through the open shelf the library places at the disposal of young people the means of ascertaining whether or in what degree they have fitness for a given career. The open-shelf library encourages its users to roam from theology to sports, from history to steam-en-

gineering and from medicine to law. Sometimes a single day spent in thus going from one subject to another suffices to indicate to the library user that his tastes till then unsuspected lie in one direction rather than another. *Habitual use of such a library before and during school education reveals aptitudes in various directions and enables the students especially under good advice to regulate the amount and direction of his formal education with far greater surety than otherwise.*

THE REFERENCE DEPARTMENT.

An important part of the educational work of the library is the assistance given to readers in their use of the resources of the library at what is known as "reference desk". The person who presides at the post is designated the *Reference Librarian*. His duties are to answer all enquiries, to assist readers in their search after information and to some extent to guide the reading public by preparing lists of references on topics of the day or on subjects of general interest. He has a thorough knowledge of the librarian's aids and guides, reference books and bibliographies. He welcomes difficult problems from earnest students whom he cheerfully helps by placing before them the best authorities from some hidden corner of the library.

Other institutions besides libraries are engaged in reference work and are important bureaux of information. These are known to the reference librarian and he refers inquirers to them when the resources of his library fail. Then there are in the larger cities enterprising firms which rent for a small fee collections of articles on various subjects clipped from magazines, theses, pamphlets etc. Where the reference collection of the library does not contain what is wanted by any serious reader, such collections of cuttings as would serve his purpose are hired for him by the library acting under the advice of the Reference Librarian.

TELEPHONE ENQUIRY DEPARTMENT.

Some of the libraries have sought to widen the scope of their usefulness by establishing a telephone enquiry department for the convenience of those who have not the time or

inclination to visit the library personally. The enquiries received over the wires cover a wide range of subjects such as conscription, co-operation, steam-boilers, hedge-hogs, ladies' fans, old age pensions, tailoring and other more or less abstruse matters. Many of the enquiries are answered immediately. Where the preparation of answers takes up time, the questioner is rung up again. In this manner the readers are also enabled to inquire whether any desired book is available and to order its reservation if it happens to be out at the time. It is worthy of note that of the telephonic inquiries only a few are found to be trivial and useless.

THE PATENT ROOM.

The inventive faculty of the community is the object of the library's particular care. There is no large library but has its patent room. Complete sets of patent specifications of all countries, files of important technical and scientific periodicals and standard works of the patent law of every government are here gathered together and admirably classified and arranged. The arrangement is by countries, subjects and dates. The collections are intended for consultation by those who want to ascertain whether the legal period of a particular patent has expired, by those who desire to know whether a particular article made or process arrived at by them is not patentable and by those who having got some new or novel idea are in need of information which may help them to develop that idea. These rooms are frequented not only by members of the community in whose midst they are situated but by persons from distant parts of the country as well. Speaking comparatively, the number of patents granted in a single year is largest in America. Considering the care taken in the patent rooms to develop the inventive faculty of a considerable number of persons it would not be unsafe to assert that a fairly good number of the patentees owe their ultimate success to the public libraries.

STUDY ROOMS.

The man who has to look up any topic in history, science or any other subject requires

the use of a large number of books for a considerable period. For this purpose well-furnished study rooms are set apart. The use of one of these rooms is granted to investigators who are allowed to keep there a large collection of books for several consecutive days. The amount of research work done in these rooms is great and it is impossible to over-estimate their value to the community.

THE TECHNICAL DEPARTMENT.

The library has realised that a large possible demand exists for reading bearing directly upon the daily occupations of its readers. It therefore, studies the industrial life of the community and endeavours to supply books that will aid every trade and every calling that exist in the city. It is eager to meet every demand and even studies the possibilities of introducing new industries so far as that can be done by means of its resources in the different departments. Its collection of technical and trade literature is placed under the care of an expert, whose duty is to bring the existence of the books to the notice of the persons to whom they are likely to appeal. He gives precious advice to the mechanic, artisan and business man who go to him for information or for the solution of some difficulty. He notifies readers about books by post and by sending to trade schools and technical institutions bulletins of such books as he thinks would be likely to interest them. Nothing is left undone to dissipate the idea that the library is meant to supply information on history, pure science, literature or art alone.

THE LIBRARY AND THE BLIND.

No activity of the library is more laudable than that which seeks to give recreation and enlightenment to the blind. Books in embossed type which can be used by the sense of touch are kept in a separate department and handled by the library in much the same way as those for the seeing. It is interesting to note that in the opinion of the American librarians the open-shelf is as necessary for the blind as for their more lucky brethren. The privilege of personal selection so considerably

given is highly prized by quite a large number of the blind readers. In many places an open-shelf reading room is also provided and stories are told or books read aloud to the blind by library assistants.

Owing to the small number of books published many of the libraries have thrown open their collections to residents in distant parts of the country. The postal department helps the library in this matter by carrying free of charge books for the blind.

THE "INTERMEDIATE" DEPARTMENT.

At certain places they have established a new department known as the "intermediate department" in addition to the departments for children and the adults. It is meant for young people of from fourteen to sixteen years of age whom the books introduce to many authors who are not found in the children's collection and who may not attract the notice in the vast adult collection. The intermediate department brings the librarian in intimate touch with those passing through the critical and impressionable period of adolescence and gives them unique opportunities for effective and beneficent work. The new departure has proved a success and it is proposed that the intermediate department should include all the boys and girls who are in their teens.

THE COMPLETE WORKS DEPARTMENT.

The commendable zeal of the librarian to reduce the circulation of the novels and increase correspondingly that of more solid books has manifested itself in certain libraries in the creation of a Complete Works department, located just next to the fiction section. Each separate volume is classified as an individual book but marked below with the volume number of the complete set, so that it may find its place in the general collection, though for the time being it is kept along with others as complete works. The interest aroused by the reading of one of the volumes in a set usually leads to a demand for something else by the same author. That the Complete Works department serves as a wholesome enticement away from exclusive novel reading to the study of serious books is beyond doubt and the device is likely to be universal before long.

RIBBON ARRANGEMENT OF FICTION.

The ribbon arrangement of fiction has the same laudable aim in view as the complete works department. In the ribbon arrangement novels are placed on a given shelf, usually the fifth or sixth from the bottom of each case around the room with non-fiction books above and below them.

STEREOSCOPIES AND STEREOGRAPHS.

With a view to divert attention from fiction to books of geography, history, biography and other classes, some of the libraries circulate freely amongst their card-holders a large number of stereoscopes and sets of travel stereographs. The stereographs are arranged systematically in tours of countries and sections and are accompanied by simple explanatory notes and maps. Thousands of these are circulated every year. The demand is so great that the libraries are often unable to meet it.

THE PRINT DEPARTMENT.

The print department may be said to be a combination of art collection and repository of useful information in pictorial form. In such a department any picture made by a reproductive process finds a place, provided it has any educational value. The pictures may be purely artistic or otherwise. The collection is made up of clippings from weeklies and monthlies, worn out books and advertisement sheets etc. The clippings are mounted and in some cases framed before being put into circulation. The value of the collection depends upon the person making it having a quick eye for elements of possible usefulness. A print may have been originally intended merely to amuse, yet it need not be discarded on that account alone. Costume, architecture, local customs, forms of animal and vegetable life, scenery and rarity are some of the elements that determine the value of the prints; but no hard and fast rules are laid down for the formation of the collection. Teachers, journalists, art-students, illustrators, engravers, fashion plate-makers, historians, literary and scientific men find the prints of great value and use them extensively.

INTER-LIBRARY LOANS.

The library's work is also extended through inter-library loans. There is not only free interchange of books between the central and the branches, between the main libraries of the same place, but also between the main libraries of different and distant parts of the country. By this system students and investigators are saved money and time, incidental to long journeys in search of books which their own libraries cannot supply. The risk and expense of transportation of the loans are borne by the borrowing libraries. This custom is adopted by many large public libraries.

TRAVELLING LIBRARIES.

The library spares no efforts to reach those who cannot use the ordinary sources of circulation. One of the methods adopted is the sending out of "travelling libraries," that is, portable wooden cases containing collections of books of different classes. A special stock of books is set aside and a force of trained assistants maintained for the work. The book cases are so constructed that they can be used to hold books and also to display them whenever desired. The cases are sent out in orderly rotation to designated depositories, which include schools, clubs, stores, fire-engine houses, factories and rural communities. An interesting feature of this rural extension work of some libraries is the use of book-waggons for taking their travelling libraries from house to house. The conditions on which travelling libraries are supplied are that some person must undertake the responsibility, keep account of their use and report regularly to the lending authorities in the form prescribed by them. The period during which travelling library may be retained at one place depends on the demand for its books. Those who take advantage of these libraries are not required to pay even the freight charges.

SUBSIDIARY AGENCIES.

In large cities the library has its work supplemented by subsidiary agencies scattered over its territory. These agencies are the branch library, deposit station and delivery station.

A branch has its own collection of books which does not include less-used books, expensive sets, and except in very special cases, books of which only one copy should suffice for the city. Regular telephonic connection and messenger service are maintained for prompt deliveries from the central library to the branch.

A deposit station consists of a small collection of books. This is generally placed in a store, school, factory, club or some other place, the books being issued during certain hours of each day or week. The station may be in charge of a library assistant, a volunteer worker, teacher, factory employee, store-keeper or his clerk.

The delivery station is operated in the same manner as the deposit station except that no books are kept at this station. Readers have to leave their orders for the books they want. The orders are forwarded to the central library which sends the books required by the first delivery, to be called for at the station by the readers.

LIBRARY LECTURES.

Very often the library happily advertises itself and encourages the use of its books by organising series of lectures in the library building. The lectures are delivered by competent and distinguished persons who generally offer their services gratuitously taking a keen delight in the work. As a rule the admission is free and only in exceptional cases a small fee is charged. At these lectures all classes of people are more or less represented. The lectures are not intended simply for the amusement of a scratch audience but for imparting solid information. The lecturer recommends books on the subject-matter of the lecture and announces which of them can be had from the library, which is, on such occasions, kept open for half an hour after the lecture for circulation. Experience has shown that though the immediate post-lecture circulation is very small, the use of books on the particular subject of the lecture and on others related thereto is decidedly stimulated. At times the lectures are printed in library bulletins for the benefit of those who could not attend them,

LIBRARIANSHIP AS A PROFESSION.

Library work is regarded as a profession requiring special training in theory and practical experience. This training and experience are given in Library Schools which are affiliated to a university or some other educational institution or a library. The instruction is by lectures, class, practice work, discussion, the giving of problems and required reading. The course is divided into administrative, technical, bibliographic, literary, historical and miscellaneous study. The period of training is one year for ordinary course and two for advanced.

The selective function of the schools is even more important than the training. No person who is not found to possess the other qualifications which are deemed essential in a good librarian is admitted to the school; and such of them as do get in by chance are made to drop out before graduation from the school.

Even more important than the training and the selection is the librarian's high conception of duties. The present day custodians of libraries do not regard themselves as curators of literary museums but as professors of books and reading with an office and work every whit as honourable as the college professors. They pay increasing attention to the "human appeal" side of their work. They prefer to err on the side of indulgence and a large minded, large-hearted interpretation of library rules rather than on that of bureaucratic stiffness and over-cautious conservatism. They feel the necessity of an ingratiating manner and an unflinching ability to avoid giving offence. In short their policy is enlightened, their administration public-spirited, progressive, open to new ideas and touched with idealism.

When persons with technical training and practical experience and such noble ideals and high conception of duties are selected as librarians, it is no wonder that they are able to give perfect satisfaction to the public, who in their turn reward them by regarding librarianship as an honourable profession. The satisfaction given to the public by good librarians and the respect paid to librarians by the public are interdependent. Good men

must first be appointed and public appreciation will certainly follow; the public appreciation will serve to attract to the profession men of the best type, who would, otherwise, keep off. The remarkable success of the American public libraries is mainly due to the proper recognition of this condition of success.

THE LIBRARY AS A PUBLISHING AGENCY.

Some of the libraries have a printing press on the premises, conducting a fairly good publishing business and doing their own job printing. The publications most often issued are the periodical bulletins containing rules and regulations, classified and annotated lists of new books, reading lists of books on special subjects and library news of local or even general interest. In some libraries the bulletins are used for the publication, from time to time, of manuscript materials in their possession.

LIBRARY PUBLICITY.

Publicity has grown to be one of the greatest powers in the modern world of business. It influences hundreds of thousands of men and women who are being made to think, swayed and compelled to do what the advertiser wants, manufacturers and merchants regard it as indispensable, political parties have learnt that it pays them to buy advertising space to place before people their platforms and the reasons why. Humane societies use newspapers and foster very successfully to educate the public. Newspapers and magazines are also extensively used to make known the special features of universities, colleges and schools for the purpose of attracting students. There is no reason then why the public libraries should not employ this great modern power in the furtherance of their work which to a certain extent is a struggle against indifference, ignorance and misconception. They stand as much in need of publicity, and of all forms of publicity that which is given by the newspapers and periodicals is at once the cheapest, quickest and most effective. The libraries have realised the value of this form of publicity through the newspapers as fully as the manufacturers, the

merchants, the politician and the director of a university, a school and a college.

To accomplish this purpose and to perform their functions the libraries press into their service every modern device, every up-to-date method of advertising the advantages and privileges offered by them. A certain percentage of the income of every library is set aside for such advertisements.

Besides the regular advertisements the libraries gain the interest and co-operation of the editor.

When there are labour unions in their constituency, the libraries get into touch with them, inform them of the resources and invite them to meet their staff. Where possible the interest of a leader among the men who will recommend to them special books from the technical department is secured. Special efforts are made to get information regarding the library's work before the unions by inducing a member of their bodies to speak before his union about what the members could find in the library. Sometimes space is secured on the bulletin boards in factories and lists of technical books posted there..

Some other methods have already been referred to elsewhere in the article and need not be repeated here. But even all these put together do not exhaust the list of the resourceful librarian's methods of advertisement.

LIBRARY PHILANTHROPY.

I would close this article with an appeal to the British Government who have done so much during so many decades in providing for Indians the means of attaining a liberal education, also to the Indian Rulers, the rich men in India and to reformers of all sorts to consider seriously this all-important question of the formation of up-to-date free public libraries. In this question as in so many others private munificence can accomplish not a little.

Indians are, and always have been, an essentially charitable people but unfortunately most of the charities are ill-advised. Princely fortunes are spent every year in senseless charities, which instead of being a real

help to the recipients only serve to place serious obstacles in the way of their progress. It is for the leaders to put a stop to such forms of charity which constitute one of the curses of India and to direct the stream of charity in such channels as public libraries. The money thus derived would go a long way towards supplying the institutions which India needs so sadly.

In America no form of public activity has received larger gifts* from individual benefactors than the library. The gifts have been so many and so large that they have been looked upon with disfavour by some persons who fear that the growth of libraries is thereby abnormally stimulated. The fear is, of course, groundless; but it shows better than columns of statistics the very large increase in the number of the institutions. Of all the benefactors Mr. Carnegie is the most notable. Perhaps, there may not be any Indian who alone can do all what Mr. Carnegie has done and is doing; but, certainly, there is a large number of wealthy men in this country, each of whom can do a good deal, and all of whom can do much more than Carnegies put together.

* According to the official "Bulletin" of the American Library Association, the total of gifts and bequests in money to American libraries was more than three and one third million dollars (i.e. more than one crore of rupees) in the year 1911. Of this handsome total Mr. Andrew Carnegie gave nearly two and one-third, million dollars. Besides money, the year's record of gifts includes sixty-five thousand volumes, six sites for library buildings, and seven buildings for library purposes.

King George's Speeches on Indian Affairs.

PART I.—A complete collection of all the speeches made by His Majesty during his tour in India as Prince of Wales

PART II.—Full text of all the speeches delivered by His Majesty during his Coronation Durbar Tour in India.

APPENDIX containing the Coronation Boons and Proclamations of King George, King Edward and Queen Victoria.

WITH 8 PORTRAITS, PRICE RE. ONE.

G. A. Natesan & Co., Sunkurama Chetty Street, Madras.

The note that sounds throughout this poem, as well as the whole series of Browning's poetry is the note of optimism which seems to be a stumbling-block to some of his critics who are apparently drawn towards the quasi-Epicureanism of Fitz Gerald's Omar or the pessimism of this materialistic age. These point out that the atmosphere they breathe in is not so full of the sweet odour of happiness as that which wafts over the poet's works. Their sentiments find an echo in the following quatrains, for instance.

"The Ball no Question makes of Ayes and Noes,
But Right or Left as strikes the player goes;
And He that toss'd Thee down into the field,
He knows about it all—He knows—He knows!"

—Omar Khayyam L.

(1st. Edn.)

or again,

"Ah, make the most of what we yet may spend,
Before we too into the Dust descend;
Dust into Dust, and under Dust, to lie,
Sans Wine, Sans Song, Sans Singer, and—Sans
End;

—Ibid. XXIII

But master singers have always maintained that man is made to move forward and "be pedestalled in triumph." Browning builds his faith on the cornerstones of God and Love. He holds that the human Soul is eternal and free and that it strives to attain perfection through a series of evolutions, being sustained and strengthened by the difficulties it has to wrestle with and overcome. He looks upon this life but as a preparation and probation for a higher and nobler one—a blessed eternal existence; and upon death as only "our church-yardy crapelike word for change, for growth," without "which 'there could be no prolongation of that which we call life.' He regards this life as being good, first because it has so many good things in it and secondly because it is so full of trials and temptations by surmounting

which one "proves one's soul." From a perusal of his poetry the reader starts up with his drooped spirits revived and the worn out faith in God re-established. His eyes are unconsciously opened to the inner harmony which makes music through all the chaos and confusion that seem to haunt, and away over the world. To him life is no longer a "dreary march to the dreaded grave." He bursts out singing with the poet.

"God's in His heaven—

All's right with the world"—*Pippa Passes*.

He feels and leans upon a mighty Hand that impels him on to noble deeds; and he knows and believes that he is not a mere ball that goes right or left as the player strikes, but that he is sent hither to strive heroically to attain perfection.

Browning's message peculiar is "Love," a force whose name consists of but a monosyllable, but which in its nature is undefined and in its scope unlimited. It may be love in any of its thousand and one forms. It is love that saves; it is love that is the sovereign remedy for all the evils of this world. It is love that holds the universe in harmony

"True life is only love, love only bliss"

The Ry. & the Bk. VII. 959.

It is in love that the lover of Pauline finds refuge. It is the want of it that results in Sordello's failure. Without love Paracelus is unhappy, though he has conquered a vast world of knowledge. It is the presence of it that relieves the fallen patriot of the disappointment and horror at the prospect of the scaffold before him. It is the absence of it that makes Cleon unhappy. It is the angelic love of Pompilia that saves Caponsacchi from his previous gay and frivolous life. It is the holy love of the priest that saves and cherishes the broken soul of Pompilia. It is the love of truth and justice that carries the Pope safe through the ground of fire and brimstone. And true love never fails.

SIR NARAYAN CHANDAVARKAR,
Acting Chief Justice of the Bombay High Court.

she estimated India's to be. This is not the place to review the life history of that great Saint. It may be said of him truly that he went and saw and conquered. Many a proud man felt his littleness in the presence of the Swami. Probably his greatest conquest was in attracting Sister Nivedita to the services of his country. I am afraid that the death of her guru robbed the good Sister of zest in life, and that is clearly traceable in all her subsequent writings.

I shall refer only to a few of her fragmentary contributions to show how India touched the noblest chord in her. In speaking of the present position of Indian woman she says "Anything more beautiful than the life of the Indian home, as created and directed by Indian women, it would be difficult to conceive. But if there is one relation or one position, on which above all others the idealising energy of the people spends itself, it is that of the wife. Here, according to Hindu ideas, is the very pivot of society and poetry." Yes, it is this feeling of poetry, this idolisation of the creative energy in the wife that makes the Hindu so intolerant of reform. To him, the divinity and the purity of the race depend upon the integrity of wifehood. I express no opinion, but I must say that the refusal to accept the remarriage of young widows as a necessary reform is attributable solely to this cause. It is in the inviolability of her position as the wife and its corollary that she can belong to one man only that are responsible for this position. They certainly afford no justification for infant marriages or for not encouraging post puberty marriages. These encrustations, if one might say so, owed their origin to economic conditions; those conditions no longer prevail and the country has to be educated to go back. Sister Nivedita's conclusions on this question are thus characteristically stated by her. "India, it should be understood, is the headwater of *Amatic thought and idealism*. In other countries we may meet with applications, there we find the

idea itself. In India, the sanctity and sweetness of family life have been raised to the rank of a great culture. Wifehood is a religion; motherhood a dream of perfection; and the pride and protectiveness of man are developed to a very high degree. The Ramayana, epic of the Indian home, boldly lays down the doctrine that a man, like a woman, should marry but once. "We are born once," said an Indian woman to me, with great haughtiness, "we die once, and likewise we are married once." Whatever new developments may now lie before the womanhood of the East, it is ours to hope that they will constitute only a pouring of the molten metal of her old faithfulness and consecration, into the new moulds of a wider knowledge and extended social formation."

Lately the work of Christian missions has been receiving attention from exalted quarters. The Archbishop of Canterbury pleads that the best that the Christian Church can produce should be sent out to India. Our Emperor has cordially seconded this proposal. Sister Nivedita's views do not materially differ from the views of these exalted personages. In this great and vast country, there is room for good work, from whatever quarter it comes. I am one of those who indulge in the dream of a common religion for all mankind. That is what has been proclaimed in this land. It is the acceptance of that declaration of the Gita by other religions that will bring about peace on earth and good will among men: I do not therefore feel the same uneasiness about the progress of other religions in India as some of my friends do. The question is, do these new professions increase goodness and brotherhood? Are converts becoming better and purer? If so, in Sri Krishna's name, let there be conversions by thousands; but if the severing of the family relationship, if the anguish of the mother and the forlorn condition of the father do not result at least in the making of one good man—not one who flaunts his acceptance of the new creed as giving him a superior

status, and as giving him a right to revile unthinkingly classes and creeds, but one who loves his country and who loves his countrymen, as children of one common mother—then it is irreparable mischief that is done. The convert's attitude towards the land of his birth and his fellowmen will depend upon the teacher under whose influence he renounces the old and takes to the new. It is to these men that Sister Nivedita addresses these pregnant words:—"Let them love the country as if they had been born in it, with no other difference than the added nobility that a yearning desire to serve and to save might give. Let them become loving interpreters of her thought and custom, revealers of her own ideals to herself even while they make them understood by others. When a man has the insight to find and to follow the hidden lines of race intention for himself, others are bound to become his disciples, for they recognise in his teachings their own highest aspirations and he may call the goal to which he leads them by any name he chooses, they will not cavil about words."

Sister Nivedita's essays on the "Civic and National Ideals" and the "Select Essays" on various subjects printed by Ganesh and Co., offer food for serious reflection to all those who honestly desire the advancement of this country. Every Indian should read them. He will find how symbols and ceremonies which are meaningless to him when looked through Western spectacles have a true and abiding sense in them in the light of the explanation given by the good Sister. India's indebtedness to the good soul is very great. She is dead. Her love and devotion to this country ought to secure at least this much, a sincere endeavour to understand the true inwardness of many things Indian which on the surface appear meaningless. India had few such whole-hearted admirers. Dr. Paul Duessen's unstinted praise of our system of religious Philosophy refers only to one factor of our national existence,

Margaret Noble, while not accepting all that ages of transformation have gathered round the cardinal ideas of Hindu nationality, can find no flaw in the basic principles of religion, polity or sociology which are the distinctive marks of our national existence. It may be that her enthusiasm has enabled her to find sermons in stones and good in everything. But there is no mistaking the sincerity of her attachment and there is no doubting the devotion of this good woman to the land of her adoption. She died as she lived—truly honoured and sincerely mourned. Peace be to her soul!

THE NEW RAINS.

BY

MR. NALINI KANTA BHATTASALI, B.A.

(From the original Bangali of Babu Rabindranath Tagore.)

Wildly swells my heart to-day,
Oh! peacock-like it dances!

Variant, like the rainbow hue,
Emotions spring forth, bright and new,
My uneasy heart the heavens scouring
Exultingly prances!

Wildly swells my heart to-day,
Oh! peacock-like it dances.

Rolling thunder goes on groaning,—
Heaven to heaven it groans!

Sweeps the rain in torrents glad,
Growing rice plant dances mad,
Wet dore shivers in the nest

Dadrur ceaseless moans
Rolling thunder goes on groaning,—
Heaven to heaven it groans.

Wildly swells my heart to-day,
Oh! peacock-like it dances!
Pours on new leaves heavenly balm,
Forest shakes with ceaseless hum,
The river overflowing the banks
Beneath the village glances!

Wildly swells my heart to-day,
Oh! peacock-like it dances.

SOCIAL STATICS AND DYNAMICS IN INDIA.

By

MR. K. S. RAMASWAMI SASTRI, B.A., B.L.

IT is one of the fundamental conceptions of sociology that society is an organism, and that there is such an entity as the social soul. This is a purely modern conception and has profoundly influenced the treatment of almost all the sciences relating to man as a social unit and has modified many an old and cherished conclusion. The great-man-theory of history which had great vogue during the days of Carlyle retreated before the new conception which showed the evolution of events as determined by social and climatic conditions and the dominating race ideas. The new conception has thrown clear and abundant light on many a dark corner of history and has afforded us a means of understanding social phenomena which we never had before.

Let us briefly realise for ourselves what are the chief elements of this new conception. An organism implies periodic rest and movement, systole and diastole of the social heart, and gradual upwardness and progress. It is by way of bringing these aspects into prominence that I have chosen to describe my subject as Social Statics and Dynamics. I will now analyse further what the conception of an organism involves. It involves organs, purposiveness, adaptability to environments, competition and survival of the fittest, progress, and correlation of structure and function. It is impossible that an organism can exist without these elements. It must have organs that will enable it to function in a proper way and to assimilate suitable elements for the purpose of its growth and development. A social organism must further have some vital purposiveness—some dominating race conceptions which in a subtle and mysterious way colour its attitudes and ac-

tions in relation to other social organisms and the universe wherein we live. Further, it must have a considerable power of adjusting itself to the ever shifting social and physical surroundings on the earth. But at the same time it is necessary that it should not lose its power of reaction or sacrifice its dominating and vital race ideas. Again, it must maintain its place in the world and obey the law of competition which is one of the inexorable and omnipotent laws of existence. Further, it must aim at progress, for change is the law of life and stagnation is death. Last but not least, it must aim at an absolute correlation of structure and function. There is absolutely no use in keeping structures that have no functions and in cumbering the organism by forcing it to maintain useless parts. The conception of an organism thus involves all the above elements and we should bear them in mind whenever we wish to study the science of society in a scientific spirit.

At the same time, we should bear in mind that there are points of resemblance as well as points of contrast as between an individual organism and a social organism. Herbert Spencer has dealt with these points in a long and luminous essay. While an individual organism and a social organism resemble in their augmentation in mass, increasing complexity of structure, and increasing mutual dependence of parts, they differ in the following matters—Societies have no specific external forms. While living tissue forms a continuous mass, the living elements of society do not so form a continuous mass. While the ultimate living elements of the individual organism are fixed in their relative parts, such a state of matters does not exist in regard to the social organism. While in the individual body, only a special tissue is endowed with feeling, in the body social all the members are endowed with feeling. These points of resemblance and contrast also should be kept in view in the discussion of sociological aspects.

In the discussion of the subject, it is necessary to make a scientific analysis of what is meant by *progress*. Progress has been defined as the evolution of the simple into the complex through successive differentiations. The chief differentiations are the differentiation of the governors and the governed, that of the civil and the religious activities, and the segregation into distinct classes and orders of workers. It is in the light of this truth that the Indian caste-system as it should be can be best studied and I shall do this later on.

We should also remember that social statics and dynamics are affected to a large extent by the centripetal and centrifugal forces operative in society. The former are the gregarious instincts of man, the common humanity that animates all human beings, and the in-dwelling God who is immanent in all things and whose

"Plastic streams

Sweeps through the dull dense world, compelling
there

All new successions to the forms they wear."

The latter are selfishness and the law of competition. The law of love is more potent than the law of competition, and hence it is that we see a gradual upwardness in altruistic endeavour and a slow unfolding of the divinity in man through the instrumentality of the social activities.

It was this ethical evolution and its significance that Professor Huxley expounded in one of his most suggestive and vigorous essays—that on *Evolution and Ethics*. He shows how the ethical process is in conflict with the cosmic process of blind and elemental struggle for existence. The body social has been designed by God for the tempering of the cosmic process by the introduction of the elements of altruism and love and by rendering possible in this way the realisation of the nature of man as *Jatचितानन्दा* or existence, knowledge, and bliss. Huxley says:—"Social progress means a checking of the cosmic process at

every step and the substitution for it of another, which may be called the ethical process, the end of which is not the survival of those who may happen to be the fittest in respect of the whole of the conditions which exist, but of those who are ethically the best." Browning has these beautiful and pregnant lines on this matter:—

"I can believe, this dread machinery
Of sin and sorrow, would confound meelse,
Devised—all pain, at most expenditure
Of pain by who devised pain—to evolve
By new machinery in counterpart,
The moral qualities of Man—how else?
To make him love in turn, and be beloved,
Creative and self-sacrificing too,
And thus eventually Godlike."

(*The Ring and the Book*).

It is hence that patriotism in the sense of a dominating love for social welfare has received such commendation at the hands of all men. It is the stepping-stone to that highest form of self-realisation—the recognition of the essential nature of the human soul as Love and the perception of the divinity of all things.

One thing that we should never forget is that religion is the social connective tissue. Without it the organism cannot function properly. It holds before the eyes of man visions of spiritual heights to be won and kept. It inspires him with a passion to sacrifice himself for the social welfare and by this means to rise to those beatitudes of love which dawn upon the inner eyes of the self-sacrificing human soul.

There is one other matter that should be touched upon before we proceed to apply the above conceptions to India. The question of the limits of conservatism and compromise in social matters is a matter that is agitating minds in India. There is a good deal of grandiloquent talk about educated Indians leading double lives and about the need for realising in life whatever new and wandering ideas happen to besiege our puzzled brains. It seems to me that while there should be the freest discussion of methods and ideals, social changes should come on very slowly

after securing a fair maximum of social consensus and should never do any violence to the fundamental race ideas. Much as I admire those who write upon their banner "No surrender to the old ideas. Realise all your ideas in life," I can never think of a greater curse to a society than the existence of men who would charge recklessly in all directions and disperse friends and foes alike and who scatter to the winds all chances of harmonious and vital progress while they cover themselves with cheap glory.

Proceeding now to the subject of social statics and dynamics in India, I wish to deprecate at the outset a tendency that is now becoming lamentably prominent in modern discussions as to our aims and methods. There is a good deal of speculation as to the origins of the Hindu race, and the most curious feature about these theories is that they are mutually destructive and agree only in one respect, that of proceeding to conclusions from assumed and imaginary premises. The easiest means of acquiring a reputation for scholarship is to start some new social theory and then go to ancient literature and tradition to discover reasons to support the theory. While I have the greatest admiration for those who patiently investigate the truth, I have the greatest contempt for those who with the object of creating class feuds and dissensions start novel theories as to social origins. Whatever may be the correct theory about the Dasyus, the Aryans, and the Dravidians, it is enough for the purpose of our social future to remember, that we are Hindus. Whatever may have been the elements that went into the melting pot, the Hindu society in its present condition had come into existence at a time of which history has no record and in regard to which even tradition and fable have only imperfect memories. Out of the social nebula was formed the far shining cosmos of Hindu Society with a definite orbit of its own and a definite place in the universe.

I shall now deal briefly with the question that is always in the forefront now a-days whenever we discuss our social position and our social outlook—the caste system. That society can reach the maximum of efficiency only by the separation of its members into distinct groups and orders of workers is a well-known sociological law. Apart from its religious basis, the caste system had an industrial and ethnical basis. Its keynote was co-ordinated work, differentiation of functions, and national service. Those who denounce it as the parent of all our ills should remember that it co-existed during vast periods of time with a great racial supremacy and a wonderful civilisation. The real source of our evils is the decline in our capacity for social life and our imperfect realisation of the great truths of our religion. If we only realise for ourselves that love is the highest element in man and our only link to Godhead, and that we live in this *Punya bhumi* (holy land) of India and are the descendants of men to whom the caste-system was a means of achieving social harmony and social efficiency and not a source of discord as with us, then will come to us again a time when as before the discords will be resolved into a newer and nobler harmony and the Hindu race will win new glories in the fields of action and of thought.

The centripetal forces in our land which deserve prominent mention in addition to those that operate in all social organisms are a common religion, common traditions, a common memory, and a common hope. Very few people realise that even before the railways and the telegraph annihilated to a large extent distances of space and time, there was a vital interaction among the various elements composing Hindu society throughout India. The great religious teachers and the *sanyasis* went throughout India and helped to form and sustain a feeling of unity and a sense of brotherhood. *Kasi* (Benares) has always been the heart of India and has always occu-

pied the first place in the affections of the Hindus. The great national epics and the Vedas formed a common inheritance. Indeed, as has been beautifully pointed out by Sister Nivedita in a recent contribution to the *Modern Review*, "It is a characteristic of India that almost every great outstanding thought and doctrine has somewhere or other a place devoted to its maintenance and tradition. . . . The whole of India is necessary to the explanation of the history of each one of its parts."

The centrifugal forces that have special operation in India to day besides such centrifugal forces as have operation in all social organisms are the tendency to form subsects, the hungering for sense enjoyments, and the tendency to promote class feuds and discussions. All these passions are our social bane and our enemies will never be slow to foster them. The separatist tendency has become so great that if you form a new village and place ten families there, they would soon form ten subcastes there. Again, in a country which set store by the things of the spirit and whose gaze was ever on the Polar Star of spiritual greatness, there has come a lust for sense-enjoyments, that craving for ever-new delights for the senses which is characteristic of the Western communities which are modest enough to call themselves the great exemplars for all societies. I do not attack a passion for the fine arts, for if these are nobly conceived and nobly realised and if they are in relation to our spiritual endeavours, they would be elevating and purifying forces. Unfortunately they do not flourish in our society now-a-days, though they once reached a high level of excellence in our land in ancient days. What I deprecate is the seeking after those things that are meant to satisfy the lower cravings of the senses—cravings which grow the more, the more we try to satisfy them. As for the frequent attempts to create class feuds in our land, I have only one word and one feeling—that of contempt. It is

only when we can conquer these centrifugal forces by the centripetal forces, when a holier spirit of social love actuates our doings and fills our hearts, when we realise how glorious is our inheritance, how great is our present work, and how full of promise is our future, that we can rise once again to those levels of thought and achievement that won for us the loving admiration of the world.

Our society has not escaped the fate of human societies generally. We also have had our periods of growth and our periods of arrested development. But while various races and civilisations flourished for a while and disappeared, we have lived and have a promise of eternal life. We are not mere meteors in the firmament of Time. Our society shines there as a fixed star lit for ever by the loving hand of God.

It seems to me that our period of arrested development is passing away, and that our national life has ceased to ebb and has begun to flow. There is a tide in the affairs of our nation and if we take it at the flood, it will lead us on to fortune. There is a great work before us and India requires that the work should be nobly done.

We should at the same time remember that purposiveness is an essential element in organic life and that in the case of our society, no progress of any value can be achieved unless we bear in mind the lines of our past evolution and the dominant race-ideas of our community. The spirit of inwardness, the recognition of divine immutability, the love of the spiritual aspects of beauty, the passion for peace, the longing for divine communion, the luminous self-poised rapture of contemplation and meditation—these are the elements which distinguish the Hindu race from all other races, and hence our aspirations and activities must be dominated by these great and distinctive ideals.

We should remember also that India can never be an isolated unit in the universe. It must be

ALFRED CHATTERTON, B.Sc., C.I.E.

it threatens to absorb our Vernaculars. Some of our leaders would have us speak and read and write in the English language. It needs very little historical study or logical demonstration to show that no vital literatures can spring up among us in a foreign tongue and that the splendours and harmonies of the highest works in English prose and poetry must ever be beyond our reach. The Pundits and their sympathisers, on the other hand, will not allow us to bring our Vernaculars into line with the spoken languages and with modern thought and sentiment. They belong to a dead era and have no more vital touch with modern things than ghosts can be supposed to have. The English language can never be anything more than a *lingua franca* in India for purposes of social intercourse, while the old Vernaculars have no life in them and are not in vital relation to the modern habits of thought and modern ideals. Our duty is to develop, modernise, and vitalise the Vernaculars, translate into them the best works of the West, establish *Sanghams* or academies to fix the new standards of style, and stimulate the reading and writing of books in our own beloved mother-tongues. We must pay special attention to the building up of the history of India, for what country can boast of such a record of achievement as our country—a land where the greatest thoughts were thought, the noblest and most harmonious words were uttered, and the most heroic and glorious deeds were done? Our vicious taste in the realms of the fine arts must be put down. Dr. A. K. Coomaraswami has been sent to us by Providence as the prophet of national art and if we do not pay heed to his words, we are bound to disappear from the pages of history as an artistic people. Only the other day I went into the house of an Indian nobleman and was surprized and pained to see that the decorations of his home were utterly un-Indian and foreign. Our music that once revealed a new paradise of sounds and took us on its

wings to the throne of Grace is dying; and what have we done to improve it and make it a living and noble and elevating force? It thus seems to me that the work before us in the world of literature and art is arduous, but it is full of noble pleasure in the present and will be the source of national elevation in the future.

Nor should we be lax in our attention to scientific and industrial development. We have been left behind in the race owing to our pre-occupation with agriculture. This age is a pre-eminently industrial age and it is a great pity that we should not have the mental equipment and the material assistance necessary for developing the resources of our country and applying our needs and stocking the world's markets with goods of all descriptions and thus taking our legitimate part in the Commerce of the world. If our leading men could be induced to take a real interest in this matter and devote to it a portion of their talents and activities, it seems to me that resolute steps could be taken to realise our dreams in this direction.

I wish to dwell briefly at this point on the present educational muddle, for on the right education of the young depends the future of every community. In ancient India education had a vital connection with religion and brought the teacher into personal and vital contact with the pupil. The modern public school system has killed these elements though it has advantages of its own. Our duty is to introduce into it these elements consistently with the aims and objects of the new system of education. I rejoice at the idea of denominational universities, as this scheme will result in the perpetuation and development of certain high racial types and types of culture. I repudiate the suggestion that a Hindu religious text-book suitable for all the Hindus cannot be devised. The highest elements of the Hindu faith are the same in all our schools of religious thought. The modern educational "reforms"

have the effect of crushing the Sanskrit and the Vernaculars out of existence and unless the reforms are thoroughly reformed, they would do more harm than good. We must make education free and compulsory; we should develop female education; we must impart artistic and industrial education; and we must bring education into living touch with our past and our present and into harmony with our highest ideals. Unless this great work is done, we are likely to drift helplessly on in the future as we have done in the past and our national life will not rise to those levels which are our dearest dreams in life.

Last but not least, it is our paramount duty to preserve in all its purity and beauty our spiritual inheritance while we improve ourselves in the various directions pointed out above. We should not merely strive to have a more unified and fuller social and national life, we should not merely strive to reach greater heights of achievement in the realms of art and sciences; we should not merely try to make our land richer and our people happier, we should keep the heights of spiritual power already won and aspire to reach higher and higher altitudes of spiritual insight and passion of devotion, so that our India may become great in the fields of material progress and general enlightenment wherein the Western nations have made conspicuous progress, and yet continue to remain what she was and has always been—the mother of religions and the saviour of the human soul.

SELECT ESSAYS OF SISTER NIVEDITA.

These essays are marked by quite a distinctive charm. The Sister was indeed, as Mr. Blair points out in his foreword to the present volume, "A writer of extraordinary range, eloquence, and power." There is an appendix to the book containing some tributes paid to the memory of the late Sister by well-known personages such as Mrs. J. C. Bose, P. J. Alexander, S. K. Ratcliffe, A. J. F. Blair and others. The book contains four illustrations and is priced Rs. 1 S 0.

THE ART OF SILK-WORM REARING IN INDIA

BY

MR. H. SUDHA RAU.

INDIA was the first of all countries to learn the art of silk worm rearing from China which is the birth place of this industry. A Chinese lady of the Royal family seems to have first brought the eggs of the worm and some cuttings of the mulberry about the 5th or 6th century A D, and introduced them in the valley of the Ganges. From there the art travelled westwards to Greece where it was introduced by Alexander the Great after his Indian expedition. From Greece, Asia Minor and Sicily learnt the art. We hear of the Sicilian silk about 12th century A D. It then spread northwards to Florence, Milan, Genova and Venice. It was during the reign of Henry VI that this was established in England. In 1522, the art seems to have found its way into Spain and we see that Benjamin Franklin laboured hard to establish the art in America. This in short is the history of the development of this industry up to the 17th century and now only four or five countries—France, Italy, Japan and India export large quantities of silk.

India was once the only country which was supplying the whole world with the raw silk and now it is one of the best customers of silk products coming from other countries. It was once the envy of the civilised West and now has hardly anything to be envied at. The country which exported 11,000 bales of silk in 1834 1835, now exports less than 2,000 bales; and the reason for such a decline is to be found in the growing conservative nature of the richer classes which prevents the capital being utilised in profitable industries. Of late the Government of India seems to be taking a keen interest in the development of the silk industry. There are now only very few places in India where silk-worms

are reared. Kashmir is the foremost of all silk-manufacturing centres. Then comes the Mysore province. It is estimated that not less than 20,000 to 30,000 persons are engaged in silk manufacture. The Punjab once employed 25,284 hands in this industry but now less than half work at it. The Central Provinces and the Bombay Presidency produce some 17 or 18 lakhs worth of silk. In Ceylon the industry is improving as we see from the account of Mr. Brain who has been a sericulturist there for the last 20 years. At the instance of Sir Bamfylde Fuller silk-worm rearing was first introduced at Shillong in 1904. Assam is the home of silk-worm rearing but mostly produces varieties of wild silks of commercial importance. The province of Mysore, Closepet, Chennapatna, Magadi, Syllighatta, Chintamani and Kolar supply the silk necessary for the whole of the Madras Presidency. In spite of the general decline of the art, as some suppose, the quality of silk exported from India is pronounced by experts to be as fine as that produced by France, Italy, Spain, Greece and Japan.

My researches at the Ramakrishna Silk-Farm, Bangalore have revealed to me that there are nearly 10 kinds of silk-worms that spin cocoons of commercial importance. We learn from the "Dictionary of Economic Products of India" that there are in all thirty-one species of *Saturniidae* or wild silk-worms found in India. But I know only three of these species. Out of ten varieties some even belong to the class known to entomologists as Bombycidae—one to *Attacus* and two varieties belong to *Antheraea* group. Mr. W. M. Hailey C. S., once Junior Secretary to the Financial Commissioner of the Punjab, seems to believe that there are altogether seventeen varieties in Bombycidae but never mentions their characteristics. Hence his theory is unsubstantiated.

The Bombycidae variety feeds upon mulberry trees (*Morus Alba*) and varieties of mulberry. They have one advantage over the rest of the

worms and that is the silk can be reeled off the cocoons very easily after boiling the unpierced cocoons in hot water and some strong solvents. A continuous thread of about 900 yards is given out of a good cocoon of *Bombyx mori* worm. The record length of thread got from experiments in the Punjab is 4,000 yards. The fibre is thickest and strongest in the centre tapering down towards each extremity. Mr. Twardle after careful experiments proves that a good silk thread should be on the average $\frac{3}{100}$ to $\frac{1}{100}$ in. at the thinnest and from $\frac{1}{100}$ to $\frac{1}{80}$ in. at the thickest part. The silk of other species such as *Antheraea* and *Attacus* is also thicker and stronger at the centre of the reeled portion than towards its extremities but the diameter is much greater than that of common silk. On this account the fibres of Tusser and Muga silks belonging to *Antheraea* group split up while reeling. Hence the rearing of the Bombyx variety is generally followed throughout sericultural centres. The *Antheraea* variety under various processes give out glossy lustre peculiar to the woven and finished fabrics. The *Attacus* variety is carded and reeled and this also gives fine fibres.

The seven kinds of the *Bombyx* variety that are mentioned by Messrs. Hutton, Moor, Wardle, Rondot, Mukherjee and Cleghorn are:—

1. *Bombyx Fortunatus* (Desi or Chotapalu)
2. " *Cressi* or Madrassi
3. " *Arracaneus* (vide British Burma Gazetteer p. 412 (1880))
4. " *Textor* (vide Hunter Gazetteer of India Vol. III. p. 7 (1885))
5. " *Sinensis*
6. " *Meridionalis*
7. " *Mori*

Of these varieties the last is the one which feed upon *Morus Alba*, the standard mulberry tree. The Royal Mulberry tree of Kashmir (the *Shabnut*) is more suitable to these worms but its fruit is too highly priced to be sacrificed for the leaves. The fruit of the mulberry is a product of good income

as a sort of sherbet is extracted from the juice which is largely used by Europeans in India. The fruit has a sweet taste. Indians eat the fruit as it is. The sale of the fruit also supplements the income of the silk manufacture and hence these should not be regarded as a negligible factor. There are other kinds of mulberry such as Philip pine variety (*Morus maiticaulis*), the Chinese variety (*Morus sinensis*) on which silk-worms feed. I have been able to trace out 4 of the species mentioned above and I am investigating into the rest. *Bombyx meridionalis* is said to be native of my own district (Cuddapah) and also of the Coimbatore district (For this refer to the Indian Museum Report for 1886 of Wood mason). I shall be greatly helped if any of the Government Forest Rangers provide me with samples of cocoons with which they might come across during their tours in forests.

Indian Arts, Industries and Agriculture

G. A. Nathan & Co., Soukram Chetty Street, Madras

The following is a table showing the result of my experiments in examining the different kinds of worms—

Class.	Colour and nature of Cocoons	Colour of the Worm	Period of the Crop	No of Crops in a year	Places where reared	Varieties of food
1 <i>Bombyx Mori</i>	White and Yellow	Grey and ash	40 days	9	Throughout Sentral centres Bengal	Black and white Mulberry Do
2 "	Golden Yellow	Dusky and bluish white	35 to 40	7	Do	Do.
3 "	Yellow	Milky white	40	8	Burma	Red and White mulberry
4 "	Do.	Do	32 to 42	6		
5 "	Not known	Bluish, Green and White	20 to 30	9	Assam and Bengal	Castor
6 "		Grey	40 to 45	6	Assam, Punjab, Bengal and Mysore	Shorea Robusta Terminalia Tomentosa
7 "		White			Assam	Catappa
8 <i>Attacus Recini</i>	White					Sum tree Chamys
9 <i>Anthrenus Mylitta</i> (Tawny)	Sulphureous Yellow					
10 "	Golden Yellow		30	7		

I said that Tusser belongs to *Antheraea* group. Tusser produces best and glossy silk but the rearing of the worm is considered to be rather very difficult. Even the Government of India seem to have failed in the attempt to rear Tusser worms even after devoting a large amount of money. It is a real wonder how the Government should have failed while villagers and wild tribes of Assam and Bengal bring maunds of cocoons to the market. These worms feed upon a large variety of trees and the following are some of them:—

- { *Shorea Robusta* (Sal)
- { *Terminalia Tomentosa* (Tel, Nallamadoi chettu)
- { *Terminalia Catappa*. (Almond).

I have discovered some cocoons on the following trees in Bangalore:—

- { *Dodonia Viscosa*
- { *Terminalia Arjuna*
- { *Anogeissus Latifolia*

I understand that Tusser worms feed upon these too. I learn from books that Tusser worms may be found upon these trees:—

- | | |
|----------------------------------|----------------------------|
| { <i>Rhizophora calceolaris</i> | <i>Pentoptera glabra</i> |
| { <i>Terminalia alata glabra</i> | <i>Reconus Communis</i> |
| { <i>Tectoa Grandis</i> | <i>Cassia Lanceolata</i> |
| { <i>Ziziphus Jujuba</i> | <i>Lagerstromia Indica</i> |
| { <i>Bombax Heptaphyllum</i> | <i>Cassia Carandas</i> |
| { <i>Careya Sphaerica</i> | <i>Ficus Benjaminia</i> |

The cocoons of Tusser worms should first be subjected to the powerful action of some solvent (Caustic Potash) to separate threads and then reeled. The worm is generally 7 inches long in the last stage and one inch in diameter and weighs 350 grains. Unlike Tusser there is another variety belonging to *Antheraea* called Muga which feed upon Sum-tree. Conditions applied to Eri-silk worms in the method of rearing equally apply to all worms reared indoors but differ in the matter of production. The following are some of the characteristics of different silks:—

- | | | |
|-------------------|--------------------------|------------------|
| <i>Bombycides</i> | Eri Silk | Tusser and Muga. |
| Strong | Does not shrink in water | Glossy. |
| Durable | Smooth and soft | Less durable. |
| Costly | Price moderate | Cheaper. |

There seems to be a belief that the Silk-Industry of India is falling off and that European cotton goods, printed calicoes and cheap broad cloths have turned silk garments out of the field and this statement is substantiated by what Mrs. Steel says regarding the use of silk by women. Mrs. Steel says "The women themselves admit their preference for the imitations of Manchester. Of course, a real *Phulkari* or bagh according to the wealth of the house must be worn by every bride during the Phera ceremony of marriage, and a certain number of embroideries will always be found in the trousse; but these become more and more for show, do duty in many outfits."

To such sentimental complaints as these I can do no better than quote the reply of Mr W. M. Hailey, C.S. He says, "If the soldier of the Khalsa no longer swaggers into the fight with his turban of daryai, if the bride no longer sends her father to the *banys* in order that she may appear with a fitting trousse of Bokharan silks, it is hardly a cause for regret. It is better that fifty people should be moderately comfortable than that one should be magnificent. That silk is still used, and largely used in the province the figures given in preceding paragraphs will prove." Though there is a slight truth in saying that silk manufactures have declined of late, yet it is quite untrue to say that cheap imitations of the West have turned silk manufactures out of India. Hindus cannot afford to be without silk, because they require silk for their Madis, silk for their Pitambers, silk for their bodies, and pure fine silk for their clothing. As such we cannot neglect this industry.

A close study of all these varieties not only reveals to us how easy it is to rear silk-worms but also teaches how we can increase the supply of silk and thus make our country commercially prosperous. Mr. Sir T. Wardle in his "Hand book of Indian Wild Silks" says, "the silk of India may with the aid of enterprise and capital yield to

systematic collection a result as profitable as that which has attended the scientific culture of tea and cinchona."

I have seen nearly 1,000 families who have been enabled to live a decent life by silk worm rearing and hence I appeal to agriculturists and richer classes to organise the industry on a sound footing and thus not only help themselves but help the country also.

THE STORY OF INDIA'S HERCULES.

BY

MR. SAINT NIRAL SINGH

DURING the last half dozen years Rama Murti Naidu, by performing his surprising feats of strength in various parts of India, has won the name of "the Indian Hercules." Large crowds have liberally patronized his shows. Much enthusiasm has been expressed by the public over his letting an elephant weighing four tons walk over his abdomen, a twelve-horse-power motor car run over his shoulder and back, two country carts loaded to the limit of their capacity with men and boys from the audience pass over his shoulders and thighs; bearing a stone weighing three thousand pounds on his chest and back and let men break a large rock on it with heavy sledge hammers; and snapping asunder a stout chain about one eighth of an inch in thickness by merely raising his shoulders. Not a few people have called him Bhima II, and some even have referred to him as an incarnation of Hanuman. In many towns the young people have shown their admiration for the man by unbolting the carriage in which he was riding and dragging it themselves. Some of the Maharajas have accorded him a cordial reception and treated him as if he was a Prince. No less than 110 medals have been awarded him by those who have witnessed and admired his wonderful feats of strength.

But with all his popularity, India knows practically nothing about the life-history of this truly great man. The story of his parentage, birth and childhood, and professional career appears to be quite unknown, although it is interesting in its very simplicity.

Rama Murti Naidu was born in 1883, in Viraghattam, a small town a short distance from Vizianagram, in the Madras Presidency. No one thought enough of him to take note of the day or the month of his nativity. His mother died when he was a two-year old infant, but his father, Rao Bahadur K. Narayan Swami Naidu, a police-inspector, lived until 1908, passing away in his forty fifth year. Both of the parents were commonplace, physically and mentally, so the "Indian Hercules" did not inherit his great strength from them.

Rama Murti's schooling began early at about the age of four or five, when, his father took him to Vizianagram and put him in the infant class of the Maharaja's College. Although he remained in this institution until the end of 1895, the boy did not make much progress in his studies, often retrogressing from a higher to a lower form.

At first he was a sickly youth, and suffered from asthma, which, strange to say, was cured by cigar smoking. But from the very beginning, Rama Murti showed an intense interest in the tales of the Hindu heroes of old, and evinced an overpowering love for athletics. He would run and romp and go through the exercises prescribed by native wrestlers, and, when he became a little older, he took to foreign gymnastics with the same avidity he had shown for those of his own land.

In 1896 the Provincial High School was organized at Vizianagram, and Rama Murti joined it as a teacher of physical culture. Since the management was not prepared to pay any salary to the boy-instructor, he had to work in

an honorary capacity. However, the position afforded him ample opportunity to engage in manly sports and develop his physique.

About three years later he joined the Sidapat Physical Training College at Madras, taking up physical culture in right earnest, remaining there for about twelve months and passing the examination with high honours, topping the list of successful ones. After that he returned to his honorary position at the Provincial High School at Vizianagram. Just about this time he discovered that his foreign exercises—his practice with trapeziums, rings, parallel bars, horizontal bars, and Sandow's dumb-bell work—were doing him no good. They produced an abnormal muscular development, but no strength. Moreover, they called for expensive apparatus. Once his mind was made up, he exclusively took up Indian gymnastics—*dand*, *Caithak*, and exercises with the *lezam*, a flexible bamboo—devoting himself night and day to them. He would walk up at three o'clock in the morning, run twelve miles at a stretch, swim for an hour, and wrestle until nine. His one ambition in life was to be a great athlete.

But the people about him were not evolved to the point where they could understand that the pursuit of physical strength was a profession in itself, and they looked upon him as a vagabond often declaring, in his very presence, that he had been born to disgrace the fair fame of the family. The youth was possessed of a great deal of animal spirits, which often involved him in brawls—innocent enough in themselves, but frowned upon by the good people of the town. It is said that Vizianagram was so enraged at one of the lad's escapades that V. Banyassiah Chetty, the local magistrate, cautioned him to take up some sort of employment.

This led to the young man joining the "Raja of Tuni Circus Company", in November, 1902. He was taken into partnership by the promoter

of the show, who, recognizing his ability, at once made him the manager of the concern. His athletic feats interested the public, and, in 1903 and 1904 a number of medals were bestowed upon him. But the circus company was not destined to live long, and broke up in 1904, leaving Rama Murti again wandering about at random. He performed here and there, as the spirit moved him, and won one or two more medals in 1905.

On May 27, 1905, came the psychological moment when Rama Murti Naidu "found himself". On that day he challenged Eugen Sandow, who was charming Madras with his dumb-bell feats. Sandow disdainfully rejected this challenge, refusing to pit his strength against that of a mere "native". But the eyes of the unknown youth were opened to his own possibilities. He had discovered his *metier*. From his childhood, stories of the Hindu god Hanuman, who bore a mountain on one hand to make a bridge for Rama and his army to cross from the southernmost point of Hindostan across to Ceylon, and the stories of Bhima's and Duryodhana's strength, had stirred his soul. Now he began to entertain notions of large audiences witnessing and hilariously applauding his performances, like those of the English physical culturist. For the first time he realized that the cultivation and exhibition of power such as he possessed was really a profession by itself, and that he need not be a mere vagabond just because he happened to care more for athletics than for anything else in the world.

His dreams were realized in the Christmas week of the same year, when he gave his first exhibition in Madras under the patronage of Lord Amptill, who at that time was the Governor of the presidency. His feats won him instant success, for nothing like them had ever before been seen anywhere else in the world. In the following January he repeated his performance before the present King and Queen, who then

were touring India as the Prince and Princess of Wales. So pleased were they with Rama Murti's strength that they gave him a gold medal as a token of their appreciation.

He immediately organized a regular company and began a tour from place to place. Successful though he was from the very beginning in attracting large crowds to witness his performances, yet his path to the temple of fame was a hard one to travel. More than once he found himself stranded in a strange city, without the funds to carry him and his paraphernalia on to the next place. On one such occasion a kindly railway official booked him "to be paid" to the next point on his itinerary. He gave two shows and collected enough money to pay for his trip and take him to the next stand. Sometimes he would have to stay for months in a town before he could raise the amount necessary to permit him to proceed on his tour. At such times he found, as so many people in distress have discovered, that when he suggested to his avowed friends that they should lend him the money to go forward, they almost invariably told him that they must consult with their relatives about it, and then never came near him again. But he believed in himself, and never lost faith in his future or failed to be cheerful in all circumstances. Always the problem of funds solved itself, and he was able to continue his travels.

In 1906 and succeeding years he performed in a number of Indian cities, winning laurels wherever he went. In 1909 he took a fast trip through some of the countries of the Far East, and was received with acclaim everywhere he exhibited his strength. While in Malaysia, an attempt was made to poison him by a rival athlete. This left him ill for many weeks, but fortunately did not bring his career to a close. This same year Lord and Lady Minto presented him with a medal, and also gave him a certificate speaking in the highest terms of his interesting feats at a

garden party at Barrackpore. A number of the Rajas and Maharajas have made him handsome presents, one of them giving him a diamond ring valued at Rs. 8,000 and Rs. 5,000 in cash, as well as a gold medal. In May of the last year he went to England, where he showed his strength to the people from all over the world collected there for the Coronation of King-Emperor George V.

Though now Rama Murti Naidu is at the pinnacle of his reputation, yet to day he lives as plainly as he did when he was a mere obscure youth. His habits of life are extremely simple and inexpensive. He has no vices of any description, and although the receipts at his booking office are large, he spends nearly all he earns upon others.

The conventional evening dress he wears while giving his exhibitions is a part of the show—as much so as the motor cars and the elephant are. But it neither expresses Rama Murti nor does he really like it. At home, when you find him at leisure, he is clad as cheaply as he was in his native village. A cotton shirt and a *dhoti* are all that you find on his person.

Nor has he changed the plain dietary on which he has been brought up. For a time he took meat as an essential part of his daily menu, thinking it necessary for his health. However, during the last three years he has reverted to a purely vegetarian regimen, refusing to take animal food of any description whatever, not even partaking of eggs.

A couple of hours after his night performance is over, he takes a light meal of rice, pulse, greens, or one or two vegetables, all mixed together and weighing not more than a half pound in all. He takes water, or sometimes plain soda, and that, too, very moderately, disdaining tea, coffee, cocoa, and spirituous liquors, never taking alcoholic drinks unless medicinally.

Although when he is performing in India he rarely retires before one or two o'clock in the

morning, the performance itself ending between eleven and twelve o'clock, yet he wakes punctually at about six o'clock in the morning, washes his face and hands, and, without eating or drinking anything, once again retires to take a couple of hours' further nap. He finally leaves his bed at eight o'clock in the forenoon, when his favourite drink is ready for him. This is made from almonds, cummin seed, and black pepper, weighing in all two pounds, soaked overnight, made into a fine pulp, then mixed with a pint of water, strained through a piece of muslin and sweetened with sugar. An hour later he eats a quarter of a pound of raw, fresh butter. Breakfast is served at one o'clock in the afternoon. It is about the same sort of a meal that he eats after his performance. At four o'clock he takes a drink similar to the one already described, made from almonds, wheat bran and milk, and eats a sort of pudding made by boiling together clotted cream, honey, butter and sugar. He positively refuses to eat anything between meals. On this simple fare he performs all his wonderful feats.

With plain living, the strong man combines high thinking. Unlike the common run of Indian athletes, Rama Murti is a man of original ideas. When you question him closely as to how he is able to exhibit such superhuman strength, he unassumingly answers: "Will power does it." He tells you in explanation that when the elephant is to pass over his person, or the country carts over his thighs and chest, or when he is to bear a huge stone on his person, or let the motor car run over him, or break the chain, all that he does is to concentrate his mind on the particular portion of his body which is to bear the brunt of the burden, and since the mental controls the physical, his body obeys his will, and he is able to perform the feat without being hurt in the least. In proof of this he harks you back to the days of the Hindu heroes, who, according to tradition, possessed tremendous strength, avowing that their

power of endurance was entirely due to will power. He emphatically states that this is not a mere euphuism, but true to the very life. He himself is a living proof of it, and, according to him, anyone can acquire physical strength by merely cultivating his mind.

Rama Murti not only professes this, but actually makes it the basis of his working philosophy. He does not disdain physical exercise. When in training he takes plenty of it, often running twelve miles without resting in a single morning, swimming, wrestling and going through gymnastic for three or four hours daily. But he relegates this form of exercise to a secondary position—often not performing it for days and weeks together. On the other hand, he is unremitting in his efforts to strengthen his mind, and never permits a single day to slip past without practising concentration.

Soon after he has arisen and enjoyed his favourite drink, Rama Murti performs his *prayanam*—breathing exercises. Through training he is able to control his breath, whether he is exhibiting his feats or not. After that he likes to spend an hour or two in concentrating his mind. He determines to ponder over a certain object, and absolutely bars all other thoughts from his brains. Through patient, every-day exercise he has gained an enviable command over his mind which he is able to set entirely at rest, going into partial or complete unconsciousness or *samadhi* as he may will.

It is in virtue of this, he says, that he is able to send his power of resistance to any part of his body where it is required for the moment, and which enables him to bear the weight of an elephant, motor car, or wagons, without injuring him in the least.

It is Rama Murti's settled conviction that the only way physical strength can be acquired is by cultivating the mind. The will must be directed, once or twice a day for a half hour or more, to demand bodily vigour. All thoughts other

than this demand must be absolutely shut out of the brain. When exercise is being taken, the thoughts should be strictly focussed upon the movements through which the body is passing, and the the benefit that is to accrue from them. The Hindu Hercules points out that this is the only way to secure health and strength, and since he is the prince of physical culturists, his precepts deserve a fair trial.

Rama Murli has great faith in the old institution of Brahmacharya, and advocates that Indian men should not marry until they are twenty five years old. He himself is still a celibate, and wishes to continue to be one until the end of his sporting career.

Rama Murli not only loves his country, but constantly thinks about its welfare. He is exceedingly unhappy because the physique of his countrymen is being undermined by early marriage and the neglect of physical exercise. It is his intention to establish a college of physical culture in some central spot in Hindostan. With this purpose in view, he is laying aside a portion of his earnings, and proposes to use the funds thus secured to found and endow this institution.

SERFDOM IN MALABAR.

BY

MR. O. T. GOVINDAN NAMBIAR, M.A.

SERFDOM in Malabar is synonymous with the condition of the Cherumas otherwise known as Pulayas, and should not be confounded with that of the numerous mountain and forest tribes that lie scattered all over the country. There are generally of two classes. The first, represented by the Nijadus, inhabit the more open parts of the lowland country. They are inferior to the Cherumas in social position, but are free and independent men, "the unredeemed sons of the forest", "the wild men of the woods."

The other class constitutes a link between these independent aboriginal tribes and the Cherumas who have been reduced to serfdom. It includes the Puniyans of Wynad, the Kurumbas, the Kurichians, the Karimbalaras, and many others, who inhabit the hilly parts of Malabar. These submit to a sort of qualified servitude and are sometimes engaged in the cultivation of forest lands, but, are not, like the Cherumas, permanently attached to any land, or its master, and cannot be sold or mortgaged like them.

The Cherumas are the aboriginal inhabitants of Malabar named after its ancient name *Chera* of which, so far as we know, they were the original rulers. For, there is ample evidence to show that Malabar was at one time the Kingdom of *Chera*, and Cheranad lying inland and south east of Calicut, gives even to day a local habitation to the ancient name. The popular derivation of the word *Cheruma* from *Cheru* (small) is probably suggested by the short, almost dwarfish figure of this class of people, and only illustrates the popular tendency to adopt superficial views on historical matters. Moreover, among the various inferior castes mentioned in *Keralolpathi* (the legendary history of Malabar,) as having come from foreign countries and settled in Malabar, the Cherumas are not found, nor does any tradition exist as to their arrival in the country at any time.

From the various traditions current among them it would appear that, as stated above, they originally held dominion over the country. The explanation of their reduction to serfdom is to be found in their conquest by the Brahmin and Nayar colonists who settled in Malabar from early times. The new settlers could not at first secure an adequate labour force through free workmen to cultivate the vast expanse of fresh and fertile land that was lying around them, and consequently frequent military expeditions had to be undertaken against the original inhabitants, who, when made captives in war, were transformed into slaves.

The law that was applied to them until lately was the Hindu Law of slavery, and under it they were regarded as *adscripti glebae*, or hereditary serfs, subject to the laws of ancestral real property, and incapable of being transferred except under similar restrictions. In other respects they were on a par with the slaves of ordinary description and were subject to all the horrors of the ancient law of slavery. When the British assumed the government of the country in the latter part of the 18th century, they became conscious of its evils and introduced from time to time various measures calculated to mitigate the condition of the serfs. An examination of these will show us the nature of the legal position of the Cherumas at present, which, when compared with their actual condition in life will enable us the better to understand what more should be done for their practical emancipation.

In 1812, a regulation was passed by the Government of Madras (Reg II of 1812), one of the clauses of which prohibited the exportation of slaves from the province of Malabar. But, it was repealed afterwards on the just ground that the Act of Parliament of 51st. George III Ch. 23. against the slave trade sufficiently prohibited this traffic by sea, and that its "more severe penalties superseded those previously established by the local Indian Legislature."

In 1819, a great evil connected with the sale of serfs was removed. Though the serfs were originally attached to the land, the servants of the East India Company had very early introduced the objectionable practice of divorcing them from their lands and selling them apart, in execution of judicial decrees and in satisfaction of revenue arrears. Some of the more humane and enlightened servants of the Company protested against this innovation, and orders were consequently issued by the Board of Revenue, Madras, under

date 13th May 1819, prohibiting the sale of serfs on account of arrears of revenue.

In the same year, 1819, Mr. Warden, the Principal Collector, wrote an interesting report on the condition of the Cherumas, and the existence of serfdom in Malabar reached in this and other ways the ears of the Court of Directors, who expressed in their despatch of December 1821 considerable dissatisfaction at the lack of precise information and called for a report. Mr. Vaughan in his letter of 1822, however, merely said that the serfs were under the protection of the laws and nothing further was done on this subject for some years.

An important measure was enacted in 1829 respecting the capacity of the slaves to give evidence in courts of justice. This was the Regulation VII of 1829, which gave the slaves the right to prosecute and give evidence even as free-born persons. This measure, combined with another, already enacted, making the master amenable to punishment if he put his slaves to death without sufficient cause, provided a most important check against the cruelty and injustice usually perpetrated by the masters on their slaves.

In 1836, the question of emancipating the serfs on Government lands came under consideration. But nothing effectual was done just then, except that orders were issued on the 12th March 1839, "to watch the subject of the improvement of the condition of the Cherumas with that interest which it evidently merits and leave no available means untried, for effecting that object."

The letters of Mr. E. B. Thomas, the Judge at Calicut, written in strong terms to the Sadr-Adalat in 1841-42, finally decided the Board of Directors to emancipate the Cherumas of Malabar, and the Government of India was called upon to legislate in the matter. Accordingly, the Act V. of 1843 was passed, and the Collector of Malabar, Mr. Conolly, widely published its provisions in the country. He, however, told the

Cherumas that it was their interest as well as their duty to remain with their masters if treated kindly. The Act of 1843 was the final measure taken towards the emancipation of the serfs in Malabar. But the real blow was yet to come with the framing of the sections 370, 371, etc of the Indian Penal Code which came into force in January 1862.

It is scarcely requisite to remark that law is not necessarily an exact transcript of practice, and that in actual life, usages may exist which are really inconsistent with its letter and spirit. It is therefore necessary to inquire into the present condition of the Cherumas in actual life, so that we may see to what extent their emancipation has brought them any real freedom, what moral and material gain it has involved, and whether it is no longer natural for them to consider themselves as serfs.

Although, as we have just now seen, serfdom had been legally abolished many years ago, the names *jenma-cherumakkals* (i. e., Cherumas who are considered as *jenmam* i. e., the property of the master,) and *vallals* (i. e., persons who receive *valli*, i. e., paddy given to a slave) still survive, and indicate the matter-of fact conditions of actual life at the present day. Every landed proprietor in the country possesses many Cherumas to cultivate his fields, who are actually his slaves and form an integral part of his property. Their children are, just as their parents were, serfs by birth, and the master is considered to have the right, if he chooses, to sell or dispose of parents and children in any way he pleases.

They are provided with small homesteads on the master's estates, and are fed all the year round at his expense, whether they work in the fields or not. Formerly, the right to work for others, except at the bidding of the master, was not conceded to them, but at the present day, if the master is not in need of outdoor labour, they are permitted to seek work at the hands of others. They cannot,

however, leave him without his consent, and if any one escapes and takes service under another master, he is pursued and brought back like a convict. The Cherumas, on their part, regard themselves as slaves, and their masters, as lords capable of doing anything with them. They have resigned themselves to this state of servitude which they have been accustomed to from time immemorial.

The powers originally exercised over them by their masters were very extensive, and the serfs had no legal protection against them. They could be disposed of in any manner that the master thought fit, and even slain or maimed at pleasure.

The usual modes of disposing them of were three, viz., *Jenmam Kanam*, and *Pattom*. By *Jenmam*, or sale, the full value of the serf was received, and the property entirely transferred to a new master. By *Kanam*, the proprietor received a loan of money, generally two-thirds of the value of the serfs, and also annually a small quantity of rice, to show that his property in them did not cease to exist. And by the third, *Pattom*, they were given over for a certain annual sum to another man who commanded their labour, and provided them with their maintenance. Of these, the last two, as Dr. Buchanan says, "are utterly abominable; for, the person who exacts labour, and furnishes the subsistence of the slave, is directly interested in increasing the former and in diminishing the latter as much as possible."

As the serfs were originally attached to the land, it does not seem that these transactions were very common in ancient days. But, when the practice became established under the East India Company's Government of separating them from the soil, they existed on a large scale, as can be seen from the statement of Mr. Vaughan, once a Collector of Revenue under the Madras Government. He says, "The sale of Cherumas, both in execution of decrees for arrears of revenue and

by mutual and private contracts, is as common as the sale of land." And how common was the sale of land, may be judged from the statement contained in Sir Thomas Munroe's Report dated 16th July 1822, that in one single taluk (or estate) out of 63 in Malabar, 1330 plantation and rice fields were sold in order to satisfy public balances.

With the emancipation of the Cherumas, and the framing of the sections 370, 371 etc. of the Indian Penal Code, the right of the landlords to dispose of their serfs as *Jenman*, *Kanam*, or *Patton*, legally ceased. But, in practice, they continued to exercise it long afterwards. Even so recently as 1891 the Cherumas used to be covertly sold, mortgaged, and leased with the lands by word of mouth. At the present day, however, the practice of selling them has, to all appearances, ceased to exist, but, *that of letting them on Patton is still common*. The annual hire in Palghat, at the present day, is 20 *para*s of paddy or Rs. 20 for a serf and his wife.

By the ancient laws of Malabar, the landlord was responsible to no person for the lives of his own serfs, but was the legal judge of their offences, and could punish them by death. Even at the present day, things are not entirely different. Of course, it cannot be denied that there has been some improvement in the treatment of the serfs in recent years. The old modes of punishment have apparently gone out of use, and a rebuke, sometimes accompanied by some caning, is at present the only punishment generally inflicted upon them. But, there is nothing to prevent the master from resorting to the old methods, and as a matter of fact, there are even now landlords in the interior parts of the country, who treat them little better than the old Romans did their slaves, maltreating them by the cruel administration of severe caning, after tying them up to trees. It may be a surprise to many that

this state of things exists in Malabar at the present day. But, it is to be borne in mind, that the Cherumas are the most obscure portion of the community, simple and mouthless, and unable to defend themselves and their rights against the violence of their masters who, rich and sometimes living in the remote parts of the country, can, to a great extent, commit acts of injustice with impunity.

From very early times, the serfs of Malabar have been employed in agriculture and its attendant processes, which remain to the present day the chief occupation of the great majority of them. Those who have abandoned the traditional occupation are few, and numbered at the Census of 1901 only 9,977 or 6.5 per cent of the total number of actual workers.

Those who are still engaged in their traditional occupation, namely agricultural labour, numbered 143,312 or 93.5 per cent of the total actual workers. Their work in the field is not confined to manuring, ploughing, uprooting the weeds, transplanting the seedlings, and harrowing, hosing etc, but extends to fencing, tending cattle, and even to carrying agricultural produce to the market, it being not customary to use carts or cattle in transportation. They not only work by day, but keep watch at night. It is very seldom that they can have a holiday. When, in the summer season, their work is a little light they are set to work in vegetable gardens, or some odd job is found for them by their master.

As regards their wages, it is exceedingly difficult to obtain any reliable information, or to put it in such a shape as will enable us to compare the position of the serfs in different parts of the country, or to form a decisive opinion as to the extent to which it has improved in recent years. For the early period, the only systematic inquiries made on this subject were those by Dr. Buchanan in 1800. The rates of wages given by him, however, have to be discounted a little, as his infor-

mation was obtained chiefly from the landlords who would be naturally anxious to exaggerate the expenses of cultivation. After Buchanan's visit, no systematic inquiries have been made. But in 1872, the Board of Revenue, at the instance of Government, called for reports from Collectors regarding agricultural wages in considerable detail, and in 1891, Mr. S. Sreenivasa Raghava Iyengar, obtained from the officers of the Registration Department some information on the rates of wages then prevailing in some of the places visited by Dr. Buchanan in 1800.

At the present day, it may be generally said that the daily wages of a Cheruman are 2 *edangallies* of paddy for a man and $1\frac{1}{2}$ for a woman. These are increased during the harvest season by one *nally* or $\frac{1}{4}$ of an *edangally*. After the harvest is over, the serfs on each estate receive an allowance of one out of every twenty *parabs* of paddy they have helped to raise. They are also paid presents on the occasions of the various annual festivals. Thus, on the *Onam* day, each gets three days' wages free without work, on the *Vishu* day, 1 *parab* of paddy, together with cloths, oil etc., and on the *Puram* day, from $2\frac{1}{2}$ to 3 *parabs* of paddy.

A mere statement of the amount of wages does not, however, give us a sufficient insight into the economic condition of the serfs. It is necessary that we should know something about their standard of living. This includes little more than the bare necessities of life, their secondary wants being few or none. Their dwellings, the best indication of the standard of living of a people, are small miserable huts, formed of sticks with walls of mud and thatched with straw, situated by the side of the rice awamps or on mounds in their centre. Their dress is most scanty and consists in the case of a male as well as a female of a single piece of cloth tied round the waist. Their food consists chiefly of rice with some vegetables and roots. A little salt and chilly take the place

of curry. From lack of sufficient and palatable food, they have a strong longing for drink, and indulge in it freely. Every evening, all of them, men, women and children can be seen going to a toddy tavern where they squat on the sand at a distance and drink as much as they can afford.

A general feature of serfdom throughout Malabar is that the serfs are all Hindus in name, however rude the forms of Hindu Religion they practise, and that they form by themselves a distinct caste which immemorial usage has doomed to hereditary servitude. They occupy the lowest place in the social scale, and are invested with pollution so that they cannot approach any of the higher castes within a distance of 64 feet. Should this prescribed distance be transgressed, the high caste man is polluted and has to bathe immediately. If it happens that the sacred person of the holy Brahmin is touched by the unholy Cheruman, an immediate bath is not sufficient. He reads much of the sacred books and changes his Brahmanical thread.

With regard to his personal comfort, the only dress of the degraded Cheruman is as stated above a piece of cloth fastened round the loins. To women as well as men, it was forbidden until lately to wear any cloth above the waist. They cannot wear gold or silver ornaments. Umbrellas must not be used to shelter the body from the scorching heat of the sun, nor shoes to protect the feet from the thorns and sharp stones of the jungle paths.

The language which the Cheruman is compelled to use is in the highest degree abject and degrading. He dare not say "I" but "*Atiyam*" (your slave) or "*Atiyangal*" (one who lies at your feet). He addresses the Nayers and the Brahmins as "*Thampurans*." He cannot call his rice "*Choru*" but "*Karikatti*" (charcoal rice), and asks leave, not to take food, but to "drink water." His house is called "*Chala*" or hut, and he speaks of his children as "*Kutangals*" or calves. When

referring to his eyes, hands or other organs of his body, he is required to prefix a word meaning "old" to them, thus *old eyes, old hands* etc.

They are not allowed to use the public road, when any man of the free-castes is walking on it. They, therefore, generally go through bye-paths made by themselves by constantly walking through them. If, by accident, they should be on the road, and perceive a Brahmin or a Nayar at a distance, they must instantly make a loud howling to warn him from approaching, until they have hastened off the road into the mud on the one side, or the briars on the other.

They sometimes make baskets, mats, etc., and when they have to sell them, they approach the villages, and having called out to the peasants, tell their want, leave the barter on the ground, and retire to the appointed distance, trusting to the honesty of the villagers to place a measure of corn equal in value to the barter. When they wish to make any purchase, they place their money upon a stone, and retire to the prescribed distance, and the merchant lays down on the stone whatever quantity of goods he chooses to give for the money received.

After pointing out that serfdom, though unknown to law, still exists to some extent in practice, we may proceed to inquire into the causes of its continued survival in the country and suggest some remedial measures for effecting its removal. In this inquiry it may be well to begin with an examination of the Emancipation Act, in order to see how far it was adequate enough to have effected its removal. European History affords abundant instances of emancipation, and under an infinite variety of detail, three main types may be distinguished from one another. Maria Theresa, in enfranchising the serfs, gave them fixity of tenure in the lands occupied by them, on condition that they rendered to the lord a fixed amount of services; the Prussian reformers gave them independent proprietorship without

any labour dues; and Napoleon, in liberating the serfs of Warsaw, simply turned them into freemen. Of these three modes of enfranchisement, that of Napoleon had produced the worst results, and the scheme of emancipation adopted in Malabar in 1813, was in no way different from it.

The relegation of the Cherumas to their present deplorable condition dates from nothing less than antiquity. This immemorial servitude has crippled them so much that they are unable to stand on their own feet without a crutch, and hence look for support and protection to their old masters, on whose estates they can pick up what is necessary for their livelihood. It is also to be supposed that the teaching of the religious doctrine of rebirth and the expiation in each life of sins committed in earlier lives has also something to do with their calm resignation to their miserable lot. A Cheruman finds himself a Cheruman, by his own fault committed in a previous state of existence, and the position conveys to him no savour of injustice or tyranny. He accepts it, so far as he may think about it at all, as a just application of the universal law, and hopes by living well through his hard probation to come to a stage higher in the next life. The unnatural incubus of their superstition and ignorance has also been not a little responsible for their stagnant condition. Many of them have not yet learned that their emancipation was effected long ago by a kind and benevolent Government whose principle of administration is that no man should be kept down by reason of the accident of birth. Poor people, they are still under the impression that there is one law for them, and another for their masters, and that in cases of disobedience or negligence they would be punished by Government.

The proprietors, on their part, naturally grudged the emancipation of their serfs, and endeavoured by enticements or persecution, to retain them in their original condition. They held out to them promises of better wages, and pretended to

A CHERUMAN AND HIS WIFE.

THE LABOUR PROBLEM IN ENGLAND.

THOUGH the strike of coal miners and others is almost at an end in England, it cannot be said that all apprehensions as to future outbursts of labour have been removed or allayed. Many indeed are the suggestions to put an end to labour unrest but no very satisfactory solution has hitherto been offered. No doubt some well digested practical proposal will soon be forthcoming which may prove fairly acceptable to the employers and the employed. Having regard to the fact that labour demands a reasonable share in the prospects of employers when these are growing larger and larger, and to the further fact that wages do not increase with the same ratio of speed as the dearer cost of living, it is obvious

that the first general or fundamental principle to be borne in mind is the regulation of wages in conformity with the two principal facts just stated. But how may that principle be formulated? A *modus vivendi* must be resorted to whereby the leaders or representatives of labour should be brought into personal contact with those of capital. The former should submit their own proposals: in what manner employees should get the benefit of the larger profits which may be yielded to the employers. The employees should be reasonable in their demands. They ought to understand that every trade and industry has its ups and downs, its years of prosperity and adversity. If profits are to be shared, they must also take the risk of the losses. It cannot be that while a trade or industry is incurring losses it can afford to pay high wages prevalent during fat years. On the other hand, the wage earners may reasonably urge that low wages with dearer cost of living are not compatible. Thus difficulty after difficulty will arise while both employers and employed are discussing the knotty questions in order to find a mutually satisfactory solution. If, however, sweet reasonableness prevails on either side, it is possible that a fair compromise might be reached. More than one definite panacea will have to be agreed to for the different eventualities which may arise. For instance, it might be necessary to formulate:—

1. What should be the wages when employers make large profits, while the cost of living is normal?
2. What should be the wages when employers make large profits while the cost of living is above normality?
3. What should be the wages when employers make large profits while the cost of living is below normal?

Or there may be the following contingencies to be provided for:—

1. The wages which should satisfy the wage earner while a trade or industry is depressed but the cost of living is normal.

THE LABOUR PROBLEM IN ENGLAND.

THOUGH the strike of coal miners and others is almost at an end in England, it cannot be said that all apprehensions as to future outbursts of labour have been removed or allayed. Many indeed are the suggestions to put an end to labour unrest but no very satisfactory solution has hitherto been offered. No doubt some well digested practical proposal will soon be forthcoming which may prove fairly acceptable to the employers and the employed. Having regard to the fact that labour demands a reasonable share in the prospects of employers when these are growing larger and larger, and to the further fact that wages do not increase with the same ratio of speed as the dearer cost of living, it is obvious

that the first general or fundamental principle to be borne in mind is the regulation of wages in conformity with the two principal facts just stated. But how may that principle be formulated? A *modus vivendi* must be resorted to whereby the leaders or representatives of labour should be brought into personal contact with those of capital. The former should submit their own proposals: in what manner employees should get the benefit of the larger profits which may be yielded to the employers. The employees should be reasonable in their demands. They ought to understand that every trade and industry has its ups and downs, its years of prosperity and adversity. If profits are to be shared, they must also take the risk of the losses. It cannot be that while a trade or industry is incurring losses it can afford to pay high wages prevalent during fat years. On the other hand, the wage earners may reasonably urge that low wages with dearer cost of living are not compatible. Thus difficulty after difficulty will arise while both employers and employed are discussing the knotty questions in order to find a mutually satisfactory solution. If, however, sweet reasonableness prevails on either side, it is possible that a fair compromise might be reached. More than one definite panacea will have to be agreed to for the different eventualities which may arise. For instance, it might be necessary to formulate:—

1. What should be the wages when employers make large profits, while the cost of living is normal?
2. What should be the wages when employers make large profits while the cost of living is above normality?
3. What should be the wages when employers make large profits while the cost of living is below normal?

Or there may be the following contingencies to be provided for:—

1. The wages which should satisfy the wage earner while a trade or industry is depressed but the cost of living is normal.

2. The wages which should satisfy the wage earner while a trade or industry is depressed and the cost of living is subnormal
3. The wages which should satisfy the wage earner while a trade or industry is depressed but the cost of living is above normal

The compromise on both sides should proceed on such a reasonable principle as to secure no undue advantage either to the one or the other. If capital has its uses, so has Labour. Both are inter dependent on each other. Both therefore must agree to accept a mutually satisfactory solution. Were a reasonable minimum wage fixed, on the basis of statistics of the cost of living during the last 25 years—which would comprise both normal and abnormal periods, all other contingent instances arising could be fairly settled.

This reasonable minimum wage would be the pivot round which these contingencies may turn. The minimum being there you may raise your percentage of a share on the profits of employers for the employed while the percentage itself should be fixed to a certain maximum point. When there are no profits but losses the minimum wage would stand. But should it happen that that wage is accompanied by a subnormal cost of living, then, it would be only reasonable that labour should submit to a reduction in the minimum wage to a certain limited extent, the maximum of which may be fixed beforehand.

THE TITANIC ENQUIRY.

The careful Marine enquiry into the "Titanic" calamity is still going on and it is hoped that the report of Lord Mersey's Committee will inform the public of the results of their investigation and the means to be adopted in future by all vessels to avert calamity of the mournful character which has given so rude a shock to the entire civilised world.

HOME RULE.

The Home Rule Bill has made satisfactory progress in the House despite many an angry denun-

ciation and submission of impossible amendments which has to be rejected on division. There was a suggestion to exclude Ulster from the operations of the legislation when passed. But it does not seem, and very naturally so, to have commended itself to the common sense of the British people and their representatives in Parliament. The Bill is bound to pass in the House, perhaps, before these sheets see the light of day. It is, however, a question what fate may await it in the gilded Chamber. The storm may burst there and leave the Bill stranded. There would be nothing surprising in that occurrence. But if their Lordships are wise in their generation and display practical sagacity they would allow the Bill to pass and await the experience which two or three years of its operations may offer. That would be the time to demonstrate the futility or the beneficence of the new fangled legislation.

THE OPIUM QUESTION

India has had her share in the House and many have been the loud objurgations heard there of the advocates of the opium lords outside it, inspired by the monopolists of the trade in Bombay and Calcutta. But the masterful Under-Secretary has been not only deaf but firm. His attitude is that of *non possumus* which is no doubt correct. These opium millionaires have made their piles. They have known how their commodity would fare in Republican China. They have bought the drug from week to week at the Government Sales with open eyes aware of converting it into shining Rupees by the million. It cannot lie in their mouth now to appeal to Cæsar to intercede and get back the intercepted profits. China, as soon as settled down, is bound to solemnly abide by her convention. She knows the colossal evils from which the nation has suffered during a century. She has become alive to the wholesale sapping of the manhood and morality of the people. And awakened as she is to her own moral and material progress she will see that

not a single poppy plant is allowed to be cultivated. If in the present disturbed condition some of the distant Viceroy, known for their rapacity, are lining their pockets with this traffic it cannot be helped. But that just gives the opportunity to the Indian monopolists to raise loud clamours which however remain unheard. It will be a proud day for the Civilisation of the World when the poppy is only grown for its medicinal virtues.

CONTINENTAL QUIETUDE.

Politically the month was serene as far as the Continent was concerned. M' Poencare strongly affirmed the *entente cordiale* now subsisting between England and France; while the new German Ambassador at the Court of St James' has avowed as the sole-object of his ambassadorial duty the establishment of greater cordiality between Germany and England. At the same time the German Reichstag has passed its budget largely increasing the military and naval estimates. But Germany's financial and economic condition at present is somewhat unsatisfactory and the Clericals and National Liberals for the house joined hands to submit a Bill to raise a larger revenue by a "tax upon wealth." The Radicals produced their measure to extend to direct heirs the existing death duties. On the other hand, the socialists were for both the measures. The wealth bill has passed and if the death duties Bill also passes there is a feeling that the finances of Germany would be greatly rehabilitated leading to economic progress which has latterly been considerably arrested.

The Hungarian quarrel with Austria seems to be in a state of suspended animation. Russia is almost overtaken with a calamitous famine, though her finances are somewhat better. She, too, is fast endeavouring to rebuild her navy, and they say there are not signs wanting of her coquetting with Germany for an *entente cordiale* if not an alliance. Alliance and ententes are, however, more concealed or disguised ways of nations for a benevo-

lent truce, while armed to the teeth. However, if they cannot avoid war, they are instrumental for the time in averting its occurrence which so far is a gain to the world of peace.

Italy is carrying on its barren belligerency with Turkey on the shores of Tripoli with spasmodic activity and occasional mastery over the attacking Turks and Alabs who are persistent and fiercely harrowing her from behind. Italy has not been able to advance a few miles in the interior from Tripoli; while the entire interior or hinter land is a seething volcano. The Great Powers have displayed to the non-European world a condition of unparalleled imbecility. The reclosing of the Dardanelles alone might awake them from their studied attitude of non-interference. They are waiting for some *decisive* catastrophe on the one side or the other to take a first move for holding a Conference. Altogether it is a sad commentary on the turpitude of the powers on which the future historian is certain to expatiate in scathing terms. Meanwhile the Turk is continuing his profitable game of watchful inactivity and pursuing the boycott of Italians with true Ottomanic vengeance. That has greatly incensed Italy and embittered her feelings against the Turk who, however, is defiant and smokes away his hook as if the whole affair was a mere play of pinprick. It is problematical when the end may be in sight. Meanwhile the domestic politics of Turkey seem to be still unsatisfactory. The Committee of Union and Progress is daily declining in its influence while making the breach wider by its uncompromising policy from behind of dooming to destruction those who refuse to obey its mandate. Turkey must still be pronounced "unregenerate". Albania seems to be again, quieting down, thanks to a more and sagacious conciliatory policy.

THE NEAR AND THE FAR EAST.

In Persia they are at their wit's end how to restore order. The crafty brother of the ex-Shah has been angling for a conference from the seat

William Pitt and National Revival. By J. H. Rose Litt. D George Bell & Sons. 16s.

In this volume the learned author attempts to describe the work of national revival carried out by William Pitt the younger, up to the commencement of friction with Revolutionary France.

The period covered by the volume is one of vital importance in English History. The lot of Pitt the younger, was cast in a period when England's fortunes were at the lowest ebb owing to the American War which in its later stages had developed into a War against maritime Europe practically. It was this war which left victor France and vanquished England pretty much alike exhausted, leading the one on to the French Revolution by bad management, and the other to a position of efficiency against Revolutionary France by economic and political reconstruction. It was besides the period of stir in politics and of considerable unsettlement in industries and economics.

These two Revolutions—the revolution in thought and politics chiefly through the work of Rousseau and the Encyclopedists and the industrial revolution—began their work about the same time and were in full swing when Pitt rose to wield the destinies of England. At home Pitt had to face serious national questions, and abroad he had to maintain the position of England unaffected despite the welter in European Politics brought about by the unscrupulous, ambitious and autocratic redress of the Balance of Power attempted by the Emperor on the one hand, and the Semiramis of the North on the other. Through a series of persistent and well directed efforts Pitt was able to effect considerable success in his policy of retrenchment and reform. In his success in effecting the reform of the Administration of India, and his failure in his attempt to solve the Irish problem alike, he shows an appreciation of the situation of England which does great credit to his sagacity as a statesman. His

handling of the *Eutente Cordiale* with France, and the Dutch crisis brings England again upon the stage of European Politics, and practically, restores her to her former position. His handling of the colonial question does not show either breadth of view or a grasp of the imperial future that it contained in germ, while his treatment of the slave question leaves one under the impression that he faced the problem rather as a politician and friend of Wilberforce than as a statesman. In the spring of 1791 Pitt's achievements were in the words of his accomplished biographer:—"After lifting his country from the depths of penury and isolation, he seized favourable opportunities for checkmating French influence in Holland, and framing the Triple Alliance with that Republic and the Kingdom of Prussia. During the year 1788-90 this alliance gave the law to Europe. It rescued Gustavus III from ruin, it prescribed terms to Austria at the Conference of Reichenbach, and thereby saved the Turks from the gravest danger, it served to restore the ancient liberties of the Brabanters and Flemings, it enabled England to overawe Spain and win the coast of the present colony of British Columbia, last, but not least, Pitt by singular skill, thwarted the dangerous schemes of the Prussian statesman Hertzberg at the expense of Poland". This is an achievement that any statesman may be proud of, and Pitt's failure to prevent the Second Partition of Poland need not be considered to detract altogether from his deserved title to be considered a great statesman. His success is all the more creditable having regard to the array of talent in the opposition which sometimes made unpatriotic, nay, even unscrupulous use of their powers and positions.

Dr. Rose in the course of the work gives convincing evidence from unpublished letters and state papers against popular and partisan misconception in regard to the character and attitude in particular questions of his hero. The book deserves serious reading by all those that wish to understand a great character wielding the destinies of a great kingdom in the critical epoch of the dawn of its imperial career.

June 3. Messrs Surendranath Banerjee and Bhupendranath Basu were accorded an interview by H. E. Lord Carmichael at Darjeeling for exchanging suggestions regarding the proposed Council Regulations.

June 4. The Muslim University Committee completed its labours to day. The members unanimously expressed their satisfaction with the regulations. Votes of confidence in the Chairman and Secretary were passed.

June 5. At to day's meeting of the Corporation of Calcutta, the Chairman was granted leave to proceed to Bombay to study the working of the Bombay Municipal Act, so that the amendment of the Calcutta Municipal Act may be framed on the lines of the Bombay Act.

June 6. The Calcutta Committee of the Institute of Journalists has passed a resolution on Lord Crewe's reference to English newspapers in Calcutta. It regrets that he has not seen fit to withdraw his offensive remarks, but seems to justify them.

June 7. In the committee stage of the Government of India Bill to-day clause 2 of the Bill was adopted.

June 8. During the further discussion on the Government of India Bill clauses 3 and 4 were adopted.

June 9. Colonel Rasul Khan, the Bombay Agent of the Amir of Afghanistan gave a Party at the Amir's bungalow, Malabar Hill, this evening, to commemorate the eleventh anniversary of Amir Habioullah's Coronation.

June 10. H. E. the Governor of Bombay and staff left Mahabaleshwar to day. The Government will now be quartered at Ganeshkhind.

June 11. Lord Loreburn has resigned on grounds of ill-health. Lord Haldane has succeeded him as Lord Chancellor and Colonel Seely becomes Secretary of State for War.

June 12. The House of Lords to-day passed the first reading of the Government of India Bill.

June 13. The Birthday Honours List was issued to day late in the evening.

June 14. A press communique in the Home Department states that His Majesty the King-Emperor has approved of the appointment of Mr. Mahomed Rafiq to be a Punes Judge of the High Court at Allahabad.

June 15. A High Court is to be established at Patna, and the Government of India ask the views of the Local Government as to the number of Judges necessary, and other administrative details.

June 16. The Secretary of State has sanctioned the appointment of an expert Mechanical Engineer for the inspection of the pumping plant in the Bombay Presidency.

June 17. Lord Crewe, moved the second reading of the Government of India Bill in the House of Lords this evening. Lord Curzon and Lord Minto took part in the discussion.

June 18. Rai Bahadur Purnendunarayan Sinha and Dr Ramkali Gupta have been elected Vice-Presidents of the Congress Reception Committee, and Messrs. Muthianath Sinha and Nahniranjan Sinha Joint Secretaries.

June 19. The High Court of Calcutta has sanctioned the proposal of starting joint offices by two or more Pleaders of Mofussil Courts for the conduct of professional business.

June 20. In reply to Mr. Mac Callum Scott in the House of Commons, concerning some unspecified references of his to the Mahomedans in Eastern Bengal, Mr. Montagu expressed regret that his remarks had given rise to misunderstanding or misapprehension among the Mahomedan people of India.

June 21. Sir Parry Lukis, Director General of the Indian Medical Service, is appointed member of the Board of Scientific Advice.

TOPICS FROM PERIODICALS.

The Women of India.

It is refreshing to read Miss Flora Annie Steel's pen picture of "The Women and Children of India" in a recent number of *The Queen*. It is a hopeless task, she says, to make the average Englishman understand that the position of womanhood in the East is more independent and more honourable than it is in England.

Deep down in the heart of every Hindu—and they make up two-thirds of the total population of India—lies an almost passionate devotion to the Great Mother of all. Their very mythology proves this. Every god is bi-sexual; the Sakta and Sakti unite to form the perfect whole. Again, the relative positions of Hindu husband and wife show how strong a hold they have on the truth that sex is ephemeral, that both man and woman are working upward to a future when there shall be no male or female, no marrying or giving in marriage. For life to the husband is incomplete without the wife. He cannot even say his prayers purely without her, the tie between them is indissoluble; together they make the perfect human being.

This fundamental belief is fostered by the fact that for one prayer which is put up to a god in India there are about a thousand to a goddess. Miss Steel says:—

All the local deities are female. Sitala is the most petitioned goddess of smallpox. Not a village is without her shrine; scarcely a mother in India, no matter of what sect or faith, but does not bring her offerings. And Sitala or Mahadevi, Kali, Durga, Bhawani, all names of the one dread goddess of Destruction, are at the heart of every worshipper, male or female in India. This being so, we begin to understand the widespread cult of motherhood as the great fundamental, unalterable fact lying at the bottom of all human effort, which is our fond, the religion of India.

It is often said by those who have seen only one side of India—the urban—that the women of India are kept in perpetual seclusion. It is a mistake to think so.

Even in the matter of seclusion, the ideas of the average English person are absolutely at fault. Two-thirds of the total population of India is agricultural, and all agricultural women help in the work of the fields. They are free, therefore, to come and go.

Devotion to motherhood is a common factor in the Indian home life. Miss Steel concludes:—

Behind all their trials, behind all the drudgery, even the dreariness of life, lies the knowledge that India worships the women, that the common proverb of daily life says, "A man owes one life to his father, ten to his religious teachers, but a thousand to his mother." And nearly every woman is a mother.

Are Buddhism and Islam Combining.

M. Vamberg, in the *Nineteenth Century* for April, is struck by the startling fact that Mohammedans and Buddhists no longer regard one another with that furious hatred and ill-will which formerly marked their intercourse. The Moslems divide humanity into mere idol-worshippers and book-possessors. The Buddhists are determined idol-worshippers. And the Moslems never tolerate idolatry. That is an immemorial tradition. History records the painful experiences of an ever recurring tug-of-war between idol worshippers and the Moslems. He says:—

Imagine, then, my surprise and amazement when recently, i. e. after the victory of the Japanese over the Russians, I noted the joyful excitement which prevailed throughout the length and breadth of the Islamic world at the military success of the formerly detested *Medjusi*. What strikes one most is the continuous and ever growing friendliness between these two Asiatic nations, or rather, between these two religions, which used to be so hostile to one another.

But unofficially, and in secret, a good deal of intercourse between the two Asiatic religions has been carried on through private individuals. Chinese Mohammedans have clearly shown that Moslems and Buddhists recognise a common foe in the person of the European. So, the Chinese Government, far from opposing this tendency, are rather inclined to support it.

The writer does not consider Pan-Islamism to be a dangerous foe. It is only the Moslem Press, notably the Turkish and Persian, which binds together the most distant parts of the Moslem Asiatic world. When the Turco-Italian war broke out, these newspapers had long columns of war intelligence and procured voluntary subscriptions in abundance. This approach between the followers of different Oriental religions has become so much more pronounced of late years that already the various nationalities are known by the collective name of Asia as against Europe. The writer sees thus the symptoms of an ever-ripening bond of unity among the Asiatics irrespective of creed or colour.

Mrs. Besant's Educational Work.

Perhaps Mrs. Annie Besant is the greatest woman of the age whose fields of activity are too manifold to be treated in a short essay. Madame Jean Delaire's article in the May Number of the *Occult Review* is devoted to the study of but one aspect of the great woman's work in India.

A short article on that greatest woman of the day, *Annie Besant*—Author, Editor, Orator, Philosopher, Occultist, Teacher and Leader of men—can, therefore, but look at her work from one standpoint, and separate, by an arbitrary process of selection, one of its phases from all the others, studying that one, and that one only.

Perhaps to the ordinary man of the world, who is neither a mystic nor a philosopher, but prides himself on his practical spirit, it is Mrs. Besant's educational work that will most strongly appeal. Indeed, it is a work of imperial significance, pregnant with possibilities for the future of our race, and of our great Indian Empire.

Our present King and Queen understood this, when, as Prince and Princess of Wales, they visited the Central Hindu College founded by Mrs. Besant at Benares, and showed a most keen and sympathetic interest, both in the school and in Mrs. Besant's methods of work.

Its object is to educate young Hindus in their own religion while at the same time teaching them the science and practical methods of our Western civilisation.

The writer then alludes to the Orders of the "Sons of India" and the "Daughters of India" initiated by Mrs. Besant in recent years. The Sons and Daughters of India pledge themselves to work for the welfare of their country but their methods are to be those of peaceful, gradual reform, never of violence or anarchy.

But the crown of Mrs. Besant's educational work in India is her great scheme for the founding of an Indian university—correctly speaking, of two universities, a Hindu and a Mohammedan. The Hon. Mr. Butler, Member for Education in the present Viceroy's council, publicly expressed the Government's willingness to help the movement. At Delhi, last December, he received an All India deputation, and gave as his opinion that there would be no difficulty in the proposed scheme, if the Hindu and Mohammedan communities were willing to contribute the necessary funds. It is hoped that these will be raised within a comparatively short time, and a new era in India's intellectual life be thus fittingly inaugurated.

The writer concludes with a reference to her greatest educational work—her activities as president of the Theosophical Society. It is impossible, says the writer, to overestimate the educative value of her numerous speeches and articles to magazines.

The Arya Samaj and Its Educational Work.

Mr. St. George Lane Fox Pitt writes an appreciative account of the educational work of the Arya Samaj in the recent number of the *Vedic Magazine*. The avowed aim of the movement he says, is the formation of high character among the Indian people. In other words it seeks to develop individuals, who will express in their lives the noblest human qualities. And what is character but the correct application of right knowledge to practical life? How then to gain right knowledge? Mr. Pitt says:—

With this object in view Swami Dayanand contended that knowledge should be sought from *soy* and all sources that may come to hand, always remembering that spiritual perception and the higher faculty of understanding were the true goal to be aimed at. He well understood that right action, that is right conduct and endeavour, went hand in hand with true knowledge and perception—that these aspects of the mind were not only quite compatible one with the other, but that they were in fact complementary and interdependent.

It has now become a commonplace of modern political controversy to insist that the first and greatest of India's need is that she should be relieved from her material 'poverty.' The writer vigorously assails this notion and urges with Pandit Guru Datta "that the real poverty from which she is suffering is the poverty of right ideas, of correct thinking and of lofty ideals and that it is this kind of poverty that should engage our first and most insistent attention."

Hence the supreme importance of moral education and character building.

The Arya Samaj having recognised this important truth saw that the surest way to secure its practical attainment was the establishment of a well thought out scheme of Gurukulas. What I have seen of these institutions is most gratifying. The children and young men belonging to them are disciplined by love and care. They are zealous, painstaking and happy. Their incentives to effort are not vulgar ambitions, with their jealousies and rivalries, but love of truth, love of country and love of God. They work with noble ideals always in their innermost thoughts; and by means of regular habits, all kinds of games and sports, as well as other wholesome recreations, they develop sound bodies and capable minds.

Bhakti.

Mrs. Alicia Simpson, M. R. A. S. contributes an interesting study of "Bhakti (Divine Love) in Hindu, Hebrew and Moslem Literature" to the May number of the *Theosophist*. Through all the ages, she says,

The longing of the human soul for God has made itself manifest and the literature of Hindus, Hebrews, and Mohammedans alike bears witness of a similar aspiration. The writings of saints and mystics of various lands show the same passionate striving towards a comprehension of the Divinity; the same ardent love of God animates Hindu philosopher, Hebrew prophet, and Christian saint. Holy men of all nations have used similar parables to typify that heavenly love, taking the earthly affection which every human creature knows and feels for parent, child, or friend as a symbol of that greater Divine Love by which God is revealed to man. Thus through the earthly symbol the finite human mind is enabled to form some imperfect concept of the infinite love of God to man. The seers of old may clothe the expression of their sense of the Divine Love in different forms, but at heart a like idea is present in all religion—the devotion which the human heart should naturally feel for that God who is its Creator, who in His goodness has given life to all.

Hindu, Hebrew and Mohammedan alike have borne witness to the value of Divine inspiration in awakening in the soul of man the love of the Eternal Being. It is said that the soul acting alone may be powerless to comprehend the Divine. But there are aids which may be adopted to induce that emotional mood in which the sense of the Divine floods man's spirit.

These aids are solitude, abstinence, concentration of thought, the fixing of the wandering mind on God. Yoga ascetics, Buddhists, Mohammedans, Greek and Roman philosophers, Christian saints, all who in transcendental experiences were made aware of God's glory and infinite power, practised methods similar in character though differing in degree, to abstract the soul from its material surroundings. Abstinence is one of the means most frequently mentioned whereby the spiritual faculties can be fostered.

The writer then gives several texts from the literature of the various religions and demonstrates the identity of their teachings. The very prayers of the saints are alike in their imports. After citing one or two hymns from the morning prayer of the Sikhs, Mr. Simpson says:—

Parallels to these ecstatic visions, resulting in an increasing outpouring of love towards God, are found in

the literature of Hindus, Christians and Mohammedans. The retiring to solitude to commune with God is a characteristic of mystics and saints. Did not even Christ withdraw at intervals from his followers, that in quietness and seclusion He might renew within Himself the spiritual force on which contact with the world daily made such great demands?

She proceeds to show that the different Sufis have urged different methods to the attainment of the same goal. But the concluding portion of the article is worth quoting. Writing of the Mohammedan mystics, she says:—

While speaking of Mohammedan mystics, mention may be made of one of the latest prophets among them, a contemporary preacher of Mohammedan mysticism, who proclaims the "splendour of God," Abbas Effendi, third prophet of the Bahais, who also teach the doctrine of love. Their path to God lies through seven valleys. The first is the valley of Search, where the wanderer goes seeking for God, and learns that He is to be found everywhere, even in the dust that is blown along the highway. Next comes the valley of Love, through which he is guided by pain, since pain teaches selflessness. These two valleys lead between the mountains to the valley of Knowledge of God. The fourth valley is Union with God, after which blessed consummation the wayfarer comes in all happiness to the fair valley of Contentment. The sixth valley is Amazement, where earthly riddles are made plain, and the traveller marvels at the revelation of Divine truth and love thus vouchsafed. Finally, he attains the valley of Poverty, where he is taught the emptiness, the illusion of worldly glory, and the value of renunciation. It is the same spirit which has animated alike Brahman ascetic, Greek sage, Christian mystic, and Persian poet.

Chinese Courage.
